# NOTES ON THE ENGLISH EDITION

*Standards of Translation.* Contributors to the Encyclopedia, drawn from the outstanding authorities of over 35 different countries, have written in many languages — Italian, Spanish, French, German, Russian, etc. To ensure faithful translation of the author's thought, all articles have been translated into English from the original language, checked for the accuracy of technical terms and accepted English forms of nomenclature by English and American art historians, and correlated with the final editorial work of the Italian edition for uniformity and coherence of the over-all presentation. Naturally the McGraw-Hill Book Company, Inc., assumes full responsibility for the accuracy and completeness of all translations. Those articles written in English appear in the words and style of the authors, within the bounds of editorial attention to consistency and stylistic and organizational unity of the work as a whole. Article titles are in most cases parallel to those in the Italian edition, though occasionally they have been simplified, as *Dravidian Art* for *Dravidiche Correnti e Tradizioni.*

*New Features.* Although generally the English-language edition corresponds to the Italian version, a small number of purely editorial changes have been made in the interest of clear English-language alphabetization and occasional deletions or amplifications solely in the interest of clarity. Three major differences between the two editions do exist, however:

A considerable number of cross-references have been added in many places where it was felt that relating the subject under consideration to other pertinent articles would be of value to the reader.

A more extensive article on the Art of the Americas was projected for Volume One of the English edition with an entirely new text and many plates in black and white and color. This article was designed to give the completest possible coverage within the existing space of some 100,000 words to a subject which, because of its interest to the English-speaking public, was entrusted to a group of well-known American scholars, each expert in his respective area.

Some 300 separate short biographies have been added to the English edition to provide ready access to data on the lives, works, and critical acceptance of certain artists identified with schools, movements, and broad categories of historical development that are treated in the longer monographic articles. These articles are unillustrated, but works of the artists are represented in the plates accompanying the longer articles.

*Bibliographies.* The bibliographies of the original Italian edition have been amplified at times to include titles of special interest to the English-speaking world and English-language editions of works originally published in other languages.

In undertaking these adaptations of the Italian text and preparing original material for the English edition, the publisher has been aided by the generous advice and, in many cases, collaboration of the members of the Editorial Advisory Commitee.

**GREEK ART.** The phenomenon of Greek art is so rich in creative force, development, and achievement, so important for the world history of the human spirit, so diversely and fundamentally present in all the problems and theories of art that it would be an impracticable task indeed to treat it exhaustively in a single article, no matter how ambitious. For the ancient world Greek art represents a cycle comparable, in a developmental sense, to that of European art from the Middle Ages to modern times. Because each of its great phases has its own values, defined and conditioned by ideal concepts and style, it seemed best to treat these distinctive strains in separate articles. The origins and early definition of Greek art are discussed in the study of Aegean art in the 2d millennium B.C. (see CRETAN-MYCENAEAN ART), as well as in those of the Geometric style and the Orientalizing style (qq.v.). In addition, there are articles for the major artists and studies of regional groups and schools, in so far as they represent identifiable currents within the vital and abundant artistic tradition of the Greek world (see ATTIC AND BOEOTIAN ART; GRECO-BOSPORAN AND SCYTHIAN ART; GREEK ART, AEGEAN; GREEK ART, EASTERN; GREEK ART, NORTHERN; GREEK ART, WESTERN; PELOPONNESIAN ART). Greek influence on the art of Mediterranean areas peripheral to the Greek world is also examined in special articles (see ASIA, WEST: ANCIENT ART; CYPRIOTE ART, ANCIENT; ETRUSCO-ITALIC ART; MEDITERRANEAN, ANCIENT WESTERN). Finally, the expansion of Hellenism to Italy and the continuity of the representational ideals of the classic world during the imperial Roman age are also considered (see HELLENISTIC-ROMAN ART; ROMAN ART OF THE EASTERN EMPIRE; ROMAN IMPERIAL ART). The spread of Hellenism farther into Asia is discussed mainly under GANDHARA; late developments of the Greek tradition, under LATE-ANTIQUE PERIOD and BYZANTINE ART; the continuity and renewal of classical ideals, under ANTIQUE REVIVAL and CLASSICISM.

But the same immense and complex subject matter that encourages such a multiplicity of viewpoints and studies also calls for an over-all picture of Greek art, in order to recount its historical development in a unified way and to indicate its significance with respect to the modern point of view — which is, after all, the only basis on which we can judge the phenomenon historically. This, then, is the aim of the present article.

SUMMARY. Historical development of Greek culture (col. 1). Greek art and the modern world (col. 17).

HISTORICAL DEVELOPMENT OF GREEK CULTURE. If a series of striking and lasting expansions well beyond original geographic or political confines is considered evidence of the vitality and inner richness of a culture, that of the ancient Greeks is beyond compare. Generally the spread of a cultural tradition may be associated with political and military events, as is the case with the Islamic world, or is due to an effective religious penetration, as with Hindu art in the wake of Buddhism. But for Greece this continuous overflowing of its narrow natural confines was almost a congenital characteristic; and merely to relate this great phenomenon to the narrow measure of its beginnings does not fully convey the magnificence of its accomplishments.

Geographically, Greece occupies the southern extremity of the Balkan Peninsula, stretching toward the Mediterranean with a deeply indented and sinuous coastline and a series of large and small islands placed like stepping stones in the Aegean Sea. Historically, however, much of the Anatolian coast and a large part of Sicily and southern Italy can for certain periods be rightfully considered continuations of Greece proper. Furthermore, if the definition of Greek artistic hegemony is extended to all regions affected and vitalized by the Hellenic expansion through colonies, conquests — even temporary ones — importations, and contacts of every kind, the list must include the entire northern Mediterranean coastline, from Spain to Syria, as well as the Nile Delta and Cyrenaica, the coast of the Black Sea from Trebizond to Apollonia and the Crimea, and, finally, much of western Asia, this last constituting the lands touched by the triumphant advance of Alexander the Great.

Greece proper can be conveniently divided into northern Greece, middle Greece, and the Peloponnesos. Northern Greece extends from the mountains of Macedonia to the point of constriction formed by the Ambracian and Lamian gulfs; middle Greece stretches from this point to the Isthmus of Corinth, where the peninsula of the Peloponnesos begins. But this elementary division of the land does not take into account that which seems to be the prime factor, and the essential condition, of Greek civilization. This overriding influence is the sea, which, penetrating the irregular coastline and surrounding the groups of islands, has constituted an omnipresent invitation to commerce and encouraged the general spirit of inquiry among the Greeks. The coast of Asia Minor in particular is connected to the Hellenic peninsula by a series of land bridges and easy marine routes. Consequently, the sea never represented a disjunction for the Greek consciousness, nor did it signify limitation, a psychological and material boundary; rather, it was a means of connection that facilitated relations with other lands. This beneficial adaptation to its marine geography underlies some of the important facts in the development of Hellenic civilization, such as the alliances between distant cities, the wide diffusion of colonial centers, and especially the close union based on common traditions that existed between the Ionic peoples of Attica and Asia Minor.

In the country that was to be Greece, signs of intense life and noteworthy cultural development were found as early as the Neolithic age. During that period it was the flat and fertile lands, especially the great Thessalian plain, which were heavily inhabited. In Crete also, neolithic strata of great thickness have been found below the Minoan level, indicating an extensive duration for this age. In fact, because of this extraordinary and precocious development of Cretan civilization, even in the Neolithic period, many innovations substantially preceded those in mainland and insular Greece. This time element then would explain and confirm the difference which has been noted between the two cultural facies. Beginning with the 3d millennium B.C., a Bronze Age culture of surprising achievement and individuality developed in Crete, reaching its high point in the elaborate civil administrations established in the famous palaces of the island, centers of a splendid and highly sophisticated culture.

Modern historians do not assign much importance to that unique document (Eusebius, *Chronicon*, ed. Schoene, p. 226;

cf. J. L. Myres, *JHS*, XXVI, 1906, p. 84 ff.) which attempts to establish the succession of thalassocracies in the Mediterranean. On the other hand, there is no doubt that the existence of cities without defense systems and sumptuous palaces without surrounding walls presupposed an absolute security which could derive only from decisive rule of the seas. Nor is there any doubt, even though the only testimony is indirect and inductive, that the Cretan state had a place among the great powers of the eastern Mediterranean, along with Egypt, the Hittite empire, and the various coastal states of Syria. The Keftiu and the "sea peoples" are frequently mentioned in Egyptian and Hittite documents. Precious objects obviously of Cretan origin have been found in Egypt, and Cretan men are represented in Egyptian frescoes of the New Kingdom.

Both its extraordinary artistic production and its predilection for the sea, commerce, and colonization make the Cretan civilization a significant harbinger of the "Hellenic miracle." Centers where Cretan culture was established are found throughout the eastern Mediterranean — Syria, Asia Minor, mainland Greece, the Aegean Islands, the Ionian Islands — and as far west as Sicily. Through vestiges of this early civilization archaeological exploration, first with the revelations of Heinrich Schliemann in Troy, Mycenae, and Tiryns and then with more methodical investigations in Crete, has given surprising confirmation to ancient and disjointed mythical traditions. The fabulous wealth of King Minos, who demanded tribute from subject peoples, and the myths relating to his labyrinth and the Minotaur and the incomparable artist Daidalos have found correspondences and astonishing illustrations in monuments that have come to light.

Together with other facts, the presence in Hellenic territory of at least six cities named Minoa is sufficient to recommend some degree of control by the Cretan dynasties over the mainland. Consequently, notwithstanding criticism, reservations, and modifications, the basic interpretation of these facts and the chronological framework presented by Sir Arthur Evans as his conclusions from decades of investigation in the palace of Minos in Knossos still remain substantially valid. In the Late Minoan period the expanding Cretan culture found a new fulcrum on the mainland, centered on the powerful city of Mycenae in Argolis. Disasters on Crete, including destruction of the palaces, can to some degree explain this notable shift in cultural spheres. The cultural and artistic world called "Mycenaean" is in effect a development of premises that had already been established in Crete for more than a millennium, although under wholly different conditions. Uncontested rule of the seas and quiet safe life in great unfortified palaces were no longer a reality for the inhabitants of the mainland. Mycenae, Tiryns, Athens, and Gla at this time presented themselves as the massive, warlike fortresses usually associated with a feudal and bellicose society.

In opposition to the Pan-Cretan or Pan-Knossan idea supported by Evans, which assumes a close and continued dependence of Mycenae on Knossos, a radically different interpretation has subsequently been gaining strength. It has, for example, been proposed that the cultural and artistic ascendancy which distinguished Knossos from the rest of Crete might be explained, at least in part, by its closer relations with the mainland. The frescoes of Knossos seem more akin to those of Tiryns, Mycenae, and Thebes than to those of Hagia Triada. The production of vases in the "palace style" is known only in Knossos and on the mainland, and pottery found in Knossos that is now recognized without doubt as imported Mycenaean ware is of even greater significance. The decisive factor in this argument is the presence in Knossos of numerous documents in the script known as Linear B, as yet undocumented in other parts of Crete but widespread in mainland Greece. Through the work of M. G. Ventris (1922–56), the Linear B of Pylos and Knossos has been read as an archaic Greek language, suggesting the conclusion that Linear A of Crete represents the Minoan language and Linear B, known on the mainland and at Knossos, is the language of the Greeks imported to the Cretan city most closely linked with the mainland culture. For the supporters of this interpretation of Linear B, the most serious and decisive consequence is the identification of the Mycenaeans with the Greeks, since no longer would it be reasonable that the latter group had slowly penetrated the Mycenaean world; instead, the early Greeks themselves would more likely be representatives of Mycenaean culture, developed by transforming and enhancing the contributions of Cretan civilization.

Whichever of the two theses is adopted, it is obvious that, although a sufficiently precise idea of the ethnic and artistic personality of the Cretan Minoans emerges, the question of the predecessors of the Greeks on the mainland remains obscure. The expression "Greeks of the classic age" generally calls to mind the earliest of the historical inhabitants of the land, variously termed Carians, Leleges, and Pelasgians, groups whose origins are obscure and uncertain. The most detailed and credible evidence of these peoples has been gained from linguistics and toponymics. The most illustrious cities and sacred places of the entire Greek world bear non-Greek names: Mycenae, Athens, Corinth, Tiryns, Parnassos, Hymettos. Similarly, the fact that the Greeks accepted words from their predecessors to designate elementary concepts of prime importance for daily life (e.g., sea, olive, fig, cypress) strongly suggests that they were a Nordic and continental people, who only later assumed typical Mediterranean conditions of life and interests.

On the other hand, it is interesting to ponder that existing side by side with this obscurity concerning the early history of the mainland inhabitants — evidencing a decided lack of interest in the fate of an alien people far removed in time — are the vivid recollections of the Minoan-Mycenaean past, which imply a more definite continuity, notwithstanding the vague interval of the so-called "Greek Dark Ages." The great legends almost invariably mention the cities or locales where traces of Mycenaean culture have been found and appear to have been significant. Mythical material may thus be regarded as a sort of poetical transposition of historical situations, a tenuous bridge of memories and fantasy stretching over the abyss of destruction and obscurity.

After a prolonged period of gradual exhaustion, attested by increasingly poor and devitalized archaeological finds, the Mycenaean world both in Crete and on the mainland collapsed amid impoverishment and destruction. Evidently this failure was a reflection of more spectacular upheavals such as the fall of the Hittite empire and the conspicuous decline in Egypt toward the end of the 12th century B.C. The uprisings and migrations that struck close to the heart of the Greek world, both along the coast of Asia Minor and on the Hellenic peninsula, appear to have ended in the so-called "Dorian invasion," which marks the definite settlement in the Peloponnesos of the last of the migrant Hellenic groups. Continuing on, the Dorians pushed across the southernmost chain of islands as far as Crete, Rhodes, and the Anatolian coast.

Evidently this "invasion" can be evaluated in completely different ways. One interpretation calls this the "Greek Dark Ages," a period of disaster and almost total ruin, with obvious analogies to the epoch of the barbarian invasions that in furious waves destroyed the weakened organism of the Western Roman Empire. An opposing interpretation sees this as a period of almost undisturbed continuity. It is possible that the Dorian invasion was not actually a changeover through destructive force but a dynastic superposition, such as the return of the Herakleidai recorded in mythology. It is undeniable that, at least in some parts of the Greek land, such as Athens, such transitions were accomplished without notable crises. However, the cumulative import of the general poverty of the eastern Mediterranean basin, attested also by Egyptian sources, the indisputable artistic decline, and the evidence of miserable Hellenic dwellings rising from the ruins of fabulous destroyed palaces is clear. There is no doubt that in this long and dramatic adjustment period some important positive events took place, such as the colonization of Asia Minor by the peoples of Ahhijava and Iaones (the Achaians and Ionians), traces of whom remain in Hittite and Egyptian sources. On the whole, it can be maintained that the process of decline reached a climax about

the 10th century B.C. According to information gained from archaeological exploration, the entire Mycenaean world was at that time disrupted. With the old cultural and economic structure destroyed, however, the people were now free to develop in a new direction.

The Greeks, an extrovert people ever ready for trade as well as admirers of the new, were in continuous contact with the outside world. Despite this inclination, Greek art is in the main so original and distinctive that scholars have periodically advanced the idea of a completely isolated and independent development. The severe discipline, the spirit of abnegation and asceticism suggested by the geometric forms of the 10th to 8th century B.C. seem without precedent. This singularity is certainly true of the best work of the Geometric age. In many areas, Crete especially, outmoded Mycenaean traditions survived well into the new period; but in Attica, where the Geometric style was most clearly and skillfully developed, there appears to have been a pronounced break with the past. The devitalized formulas of the Mycenaean epoch were replaced by completely new structural and decorative principles.

In other fields of intellectual endeavor, however, persistent interest in the past during the dark interlude seems ultimately to have favored renewed productivity. As if a reserve of creative energy had accrued during the centuries of dormancy, poetry and mythology again flourished, nostalgically recreating the splendors of the past. As remarked earlier, the more notable legends concerned cities and places thriving during the Minoan-Mycenaean era: Crete, Troy, Ithaca, Argolis, Pylos, Thebes, Athens.

The greatest surviving document of the age, the poetry of Homer, written in Ionia about the 8th century B.C., recreates in poetic legendary form the wars apparently connected with Aeolian expansion in Asia Minor. In his work certain basic qualities attributed to the Greeks are already to be observed, such as their passionate attachment to tradition and the worship of the heroic ideal. Based on deeply rooted feudal and tribal traditions, the Homeric poems reflect a world of privilege dominated by the aristocrat and the warrior. Its faithfulness to tradition communicates a deeply felt homage to the past. Still, the poetic spirit that animates Homer's work transcended its specific derivation and encouraged its adoption by an entire people as a sort of epic ideal, or even sacred scripture. Consequently this poetry, which at first must have been on the level of recounting familiar and courtly feats (χλέα 'αγδρῶν) of some of the Aeolian or Ionic races, permanently fixed the religious beliefs, the cosmogony, the way of life, and above all the heroic aspirations of an entire people. Moreover, in the Homeric poems the old assertive individualism of the various cities and races had already disappeared. Dispensing with narrow local allegiances, these epics deal with the common glories of Greece, of a Panhellenic undertaking in which the first place is given to the Argolid and Mycenaean peoples and no longer to the Ionian heroes.

The perplexing statement of the late T. J. Dunbabin — namely, that Greek history begins in 776 B.C. with the Olympiads — has surprising validity, since it was apparently in this century that the Homeric poems were written and that colonial expansion began with the founding of Cumae, Syracuse, Sybaris, Taras (Taranto), and Kroton (Crotone). It was also in this period that regular sponsorship of the Panhellenic games was initiated, thereby providing a strong bond of tradition for the Hellenic peoples. Also at this time, eastern Greece (called "Ionia" even though Aeolian and Dorian peoples were included within its boundaries) finally became a conscious cultural entity, for the ancient Hellenic penetrations into Asia Minor during the 2d millennium B.C. had not resulted in the emergence of any definite national character. This cultural diffuseness is demonstrated, at least in part, by the fact that the earliest known sources for the Ionic world are Oriental records of the Ahhijava people (Homer's "Achaians") and those of the Iaones and Yavana of Cyprus and the Anatolian coast. It is clear that many of these peripheral settlements merged to a great extent with the peoples of Asia Minor. There was a general interpenetration of Greek and indigenous elements along the coast of Asia Minor. In Caria and Cilicia, Greek races adopted the local language and way of life; the Iaones and Yavana, settled at the borders of the Oriental world, were essentially soldiers of fortune without strong cultural identity. It was mainly through worship of tradition and the heroic ideal, both of the present and the past, that Ionia established its identity and its union with the Hellenic peoples.

As far back as its earliest historically documented period, Greece proper evidences a well-defined and distinctive character. Although the cultural unity of the Greek peoples, their superior civilization and adaptability, seems to have been widely recognized, their political organization was an assemblage of the most diverse and contrasting elements. Hereditary monarchies, landed aristocracies, mercantile oligarchies, and aggressive democracies (Bowra) were found side by side, almost as if to emphasize the explosive vitality and individuality of the Greeks. The basic unit of this fragmented world was the largely autonomous polis, which exalted and guaranteed the passionate desire for liberty characteristic of the Hellenic people from the beginning. Thus, Greek history is in reality the cumulative history of the Greek cities — their rivalries, battles, and ever-shifting alliances. Because of the dearth of documented information concerning most of these centers, their character must be deduced from a few external facts and from the interpretation of archaeological evidence.

From the 8th century B.C. on, one of the prime demonstrations of the wealth, political stability, and vitality of a polis was the foundation of colonies. The commerce stimulated by the network of major colonies and smaller commercial centers established by the Ionian cities was the principal source of the economic prosperity of Greece. The commercial empire on the Black Sea and throughout most of the Mediterranean must have attained its maximum development in the period lasting from about the mid-7th century B.C., when Phoenician commerce declined as a result of the destruction of Tyre, to the restoration of prosperity and power to the Phoenician colony of Carthage, the heir to antique traditions.

The founding of a colony was an act of great social and political significance and was preceded by religious consultations and deliberations. From this practice was derived the early importance of the oracles, who inspired (or diverted) and directed these activities, and the unquestioned authority of Delphi, which was soon manipulating the colonial policies of all Greece. Usually a colony bore the stamp of the city responsible for its founding. In exceptional cases, however, when the establishment of a colony was of more widespread import, cultural elements deriving from more than one Greek city or from several ethnic groups were consolidated (synoecism). Occasionally colonies were almost Panhellenic, such as Naukratis, the Greek commercial center in Egypt. Participation in colonial enterprise differed in degree and purpose in various cities; in general, the founding of a colony presupposed maritime and commercial interests. For a state such as Sparta, however, a traditionalist power situated at the center of the Peloponnesos and primarily interested in land for its empire, the founding of colonies — among others, Taras (Taranto) and Akragas (Agrigento) — was primarily a question of prestige, and probably also a measure of Laconian influence at Delphi. Athens had almost no part in these colonial undertakings; whereas Chalkis was probably the initiator, with a string of ancient and splendid western colonies (e.g., Cumae, Messina, Reggio Calabria, Catania) that soon became more important than their metropolis, or mother city. Even more impressive was the colonial activity of the modest city of Megara, which became the metropolis for Byzantium, Chalkedon (Chalcedon), Selimbria, and Megara Hyblaia (Hyblaea). But the dominant influence in this enormous political and commercial activity is revealed in archaeological finds from this period: everywhere in Greece proper, on the islands, and in the farthest colonies and most forsaken barbarian centers in the Mediterranean, pottery made in Corinth or in the Corinthian style predominates.

Accompanying this expansion in the Mediterranean area was a comparable increase of contacts with the Oriental world. Although the influence of Near Eastern civilizations had long been present in Greece, the most regular and intense cultural

contact, borrowing, and dependence occurred in the period following the Geometric age. This phase of Greek artistic development has been characterized by the term "Orientalizing." A noteworthy indication of this confluence was the importation — perhaps by way of Lydia — of the Semitic Phoenician alphabet and system of measures and coinage. On the other hand, the Greeks, and particularly the Ionians of Asia Minor, penetrated the great Near Eastern kingdoms in many ways. There was undoubtedly the customary trading and an exchange of artists and craftsmen, as well as the accepted use of Greek mercenaries attested in Assyria and Egypt. The Anatolian states, especially Lydia and Phrygia, which had been built up on the ruins of the Hittite empire, were Hellenized to a great extent. This bond is confirmed by the number of ex-votos left by Asiatic rulers in the Greek sanctuaries, such as the tripods of the Lydian kings Alyattes and Croesus at Delphi, and by the substantial importation of Greek pottery even in remote inland places such as Gordion. Most significant of all, however, is the Hellenic character of the Anatolian art created by the Carians, Lydians, Phrygians, and Lycians. The results of this exceptional process of amalgamation are found in the most diverse works of art, for example, the reliefs from the Lycian tombs and the very fine Gordion frescoes. It is also possible that Greek artists may have worked on the great frieze of the palace of Darius at Ctesiphon.

Assuredly the attitude of the Greeks toward the peoples of the Near East was one of familiarity and friendship. The opposition between Greek and barbarian so often mentioned had as yet no reason to exist, especially in the Ionic world of the 8th and 7th centuries B.C. In effect, the threat of the true enemy, Persia, was just beginning to take shape, while a more or less peaceful coexistence was being established with Lydia and Phrygia. At this time the name "barbarian" — far from implying contempt, enmity, or even opposition — simply meant "those who stammer" (i.e., speak languages other than Greek).

Generations of scholars have believed the contacts of the Greek world with the ancient Eastern civilizations to have existed solely or primarily through the mediation of Ionia. Present opinions are varied but are in general allied against this conviction. The recognized importance of Urartu, estimated mainly by the exportation of bronzes throughout the Aegean littoral, Etruria, and other areas, the subjective and variable evaluations of the importance of Phoenician commerce, the exploration of previously unknown trade centers such as Al Mina in northern Syria, which suggests close contacts with Assyria, and the study of Syro-Hittite sculpture have all resulted in a continual shifting of opinion. To these factors can be added the flow of trade with Egypt, the intermediary function of the easternmost islands, such as Cyprus and Dorian Rhodes, and the peculiar adaptations of Oriental elements in Crete and Corinth. It can be concluded that the main avenues of penetration and trade were continuous and varied, a condition to be expected in countries so receptive to the new and thoroughly infused with an attitude of enlightened tolerance. A continuous, revitalizing flow of Oriental forms and schemata clearly entered the purportedly closed world of the Geometric style. Noteworthy among these influences were the importation of Syrian and Phoenician ivories and the progressive Hellenizing of the ivory industry, which transformed the rich and sensual hieratic statuettes of Syrian origin into the clear-cut logic of the severe Dipylon figurines.

In the 8th and 7th centuries the development of colonial politics and the intense interest in new contacts generated remarkable vitality at the margins of the Hellenic world, in Asia Minor and the Italian colonies more than in Greece proper. It was at this time that the distinctive character of the various Greek territories became more clearly defined. Simultaneous with this newly developed emphasis on national awareness of the Hellenic peoples, their inborn love of liberty found expression in the expansive individuality of a propitious political unit, the city-state, with its unceasing affirmation of independence. The decay of the monarchic institution was by now almost general: in Athens the king continued solely as a religious functionary, and the principle of absolute monarchic authority was nullified even in the restrictive and traditionalist atmosphere of Sparta by a system of dual kingship. Fundamental differences in political regimes, economic interests, and levels of development produced varied attitudes toward environment and events, and hence the prevailing diversity of cultures in this period.

The cities of Ionia were all commercial or colonial powers, closely tied to the fortunes of the Anatolian states for which they served as outlets. The region later inclusively called Ionia, along the coast of Anatolia, should be separated into the Aeolian territory in the north, whose principal poles were represented by the city of Kyme and the great island of Lesbos, and the Ionic territory proper, whose richest and most powerful centers were the cities of Miletos and Phokaia. The Dorian cities to the south — Halikarnassos and Knidos — were allied to Dorian Rhodes. This entire region played an important role in preserving and developing the pure Hellenic spirit, at the same time evidencing a continued absorption of Oriental elements. In effect, despite fusion of races on the periphery and the frequence of mixed marriages (such as those of the King of Phrygia with the daughter of Agamemnon, the monarch of Kyme, and of the tyrant Thrasyboulos of Miletos with a daughter of King Alyattes), the Hellenic spirit remained dominant and spread its wealth, rather than being itself substantially modified by contacts and external influence.

The colonial activity of Miletos, the most important Hellenic city of the 8th to 6th century B.C., developed a network of colonies and commercial outposts — about eighty according to ancient historians — on the Black Sea. The foundation of Milesios Teichos and the subsequent participation of Miletos in establishing Naukratis mark the limits of her far-reaching interests in the Eastern world. Phokaia, on the contrary, was decidedly oriented westward; and its foundation of Massilia (ca. 600 B.C.; mod. Marseilles), well beyond the Etruscan-ruled Italic coast, established the farthest bulwark of Hellenism to the west. When the Persians later destroyed Phokaia, its populace sought a new homeland and eventually settled on the Italian mainland at Velia (Elea), in the region of Lucania, after an unsuccessful attempt to install themselves in Corsica.

On the whole, the same tolerance and harmony that existed between the Hellenic groups and the peoples of the Asian hinterland must also have existed among the cities of the Ionian coast, regardless of racial distinctions. The apparent use in the Homeric poems of both the Aeolian and the Ionian dialects encourages the assumption of a basic identity of interests, just as the Trojan War, which the poems celebrate, had a Panhellenic character. Furthermore, the formal language used from Dorian Rhodes at the extreme south as far north as Phokaia and in Lesbos seems to have been basically uniform, or at least more closely related than dialects used by cities on the Hellenic peninsula that were geographically much closer. The prolonged rivalry between Miletos and Samos does not seem to have impaired their general affinity of interests. Added proof of the common level of understanding among Ionian centers is found in the pottery style, provisionally called "East Greek," that developed during the 7th and 6th centuries. Rich stores of this pottery which have appeared in Ionian cities and their colonies on the Black Sea exhibit a great range of subtle local variations on uniform over-all principles of form and decoration.

On the island of Crete, by this time deeply impregnated with Dorian elements, the prestige of ancient traditions continued. In the almost total obscurity of historical events, only archaeological remains furnish an occasional ray of light. The important examples of bronze production, such as the shields from the Cave of Mount Ida and the later examples from Assos, together with the discoveries of very fine pottery, are sufficient to indicate the high level of artistic and social development on the island. Moreover, it is on Crete that the Daedalic style, which provides the first known examples of monumental sculpture, seems to have originated. Daedalic traditions thereafter rapidly spread to the Peloponnesos, Argos, and Corinth, where the high quality of this artistic mode was maintained in a long, continuous development.

The splendid city of Argos, the oldest in Greece according to tradition, steadily declined in the face of the growing military

power of Sparta. The great Peloponnesian confederation that had its seat in Argos was dissolved, while the authority of Sparta was slowly and inexorably consolidated. As a result, because of the balance of power or the opposition to the unbending traditionalism and uncompromising oligarchy of Sparta, Argos regularly found herself allied with Athens. With regard to artistic production, archaeological finds for the period do not correspond to the glories suggested by literary tradition. Evidently bronzes were the chief forms, and it is therefore understandable that archaeological remains are scarce and furnish inadequate evidence. The ceramic ware of Argos had a distinctive character but remained a local phenomenon without wide commercial diffusion; it did not spread even to nearby centers in the Peloponnesos.

Corinth, a naval and commercial metropolis bridging two gulfs, and consequently in contact with both eastern and western cities, was the most powerful and flourishing trade center of the Greek mainland. Here, too, in the shadowy ages bordering on legend, there was a monarchy that apparently deteriorated into an oligarchy dominated by the Bacchiadai, descendants of an ancient ruling dynasty. As usual the oligarchic rule alternated with periods of tyranny — in the classical sense — which in Corinth, under the enlightened government of Kypselos and his descendants, seem to have coincided with the periods of greatest splendor. Although Corinth itself did not produce many monumental works of art, sufficient idea of the characteristics of Corinthian production can be gained from the pediments of Kerkyra (I, PL. 343), the metopes of Thermon (I, PL. 336), and the Karapanos terra cottas in Athens. Corinth, as might be expected, was closely tied to her powerful colonies Kerkyra and Syracuse. In addition, her artistic influence dominated all western Greece, from Olympia, where a large number of Corinthian bronze shield lamina decorated in very delicate relief have been found, as far as Dodona and Trebenište in Illyria. From the 8th to the mid-6th century B.C., the wide diffusion of Corinthian pottery throughout the Mediterranean littoral gives evidence of the magnificence of her commercial empire. The tiny, highly refined perfume vases of Corinth have been found in the most widely scattered cities and centers around the Mediterranean. Such testimony of the superior products and commercial preeminence of Corinth has been found even in the eastern Ionian cities, despite flourishing local production completely different in character. Politically, Corinth remained the implacable enemy of Athens. At first allied with Argos, Corinth later sided with Sparta, but all the while maintaining a degree of autonomy, in part made possible by her great fleet. In the bitter contests with Athens, the point of encounter was usually Megara, which, because it was situated between the two adversaries, was continually allied with or temporarily annexed by one or the other.

The more primitive and mountainous areas such as Arcadia, Anatolia, and Acarnania were neither politically nor artistically very active. The small region of Phocis, however, in its role as custodian of Delphi, one of the most important Panhellenic sanctuaries, found itself the hub for the subtle game of diplomacy and the interacting spheres of influence. Through the homage paid by Oriental countries and because of its growing directorial function in colonial politics, the Delphic oracle and hence Phocis became increasingly important. The proximity of Delphi even affected Boeotia, an aristocratic and conservative region in which religious considerations were of vital importance. Traditionally, Thebes remained hostile to the greater, enlightened power of nearby Athens; politically, it was invariably bound to the Peloponnesian powers, especially Sparta and Corinth. Artistically also, the region seems to have been under Corinthian influence — Corinthian and proto-Corinthian pottery was widely imported — and it is only at the end of the archaic age, for example, in the large sculpture, that significant contacts with Attica and the Cyclades are to be noted.

Chalkis in Euboea was one of the great commercial metropolises of Greece in the 8th and 7th centuries B.C. At its zenith it ruled over the Northern Sporades, including Skiathos and Peparethos, and simultaneously in the west founded the oldest and most renowned of the Greek colonies (Cumae; Naxos in Sicily; Rhegion, mod. Reggio Calabria; Zankle, mod. Messina), as well as participated in the founding of Catana (mod. Catania) and Leontinoi (mod. Lentini). Later the wars with its great Euboean rival Eretria drained the strength of both combatants, preventing them from expanding their power further. The bronzework of Chalkis was praised by ancient commentators, but examples have not been identified as yet. There is no confirmation of the hypothesis attributing to Chalkis the production of the vases commonly known as "Chalcidian," which in reality were probably made in Italy. What is indisputably Euboean pottery is clearly a provincial production with but slightly differentiated characteristics that in general depend on Attica.

Thessaly, the large and wealthy area in the north of Greece made illustrious by the legends of Achilles, the Minoans, and the Argonauts, also remained of marginal importance in the great historical movements so identified with Greece proper during these centuries. Grouped about a large and fertile plain, the Thessalian cities were among the first to unite in amphictyonies, religious confederations that did not violate the liberty of the individual cities yet permitted a more united front and a valid basis for political action. On the other hand, her predominant land interests diverted Thessaly from engaging in colonial politics and the far-reaching commercial activities of the coastal cities. Thessaly thus oriented her political activity almost exclusively about the sacred city of Delphi and succeeded very often in imposing her will through this occult moral center of the Hellenic world. Later the chief function of Thessaly was to supply sturdy horses and well-trained cavalry to the other Greek territories, and eventually to Macedonia.

In this variegated assemblage of Greek cities and races, in the vitality of their military activities, commercial enterprises, and literary and artistic production, the influence of Sparta and Athens became ever more distinct and imposing. Even if only for short periods and imperfectly, these two cities more than any others attempted to unify the fragmented Greek world on an imperialistic basis. From the beginning Sparta remained a military and land power, alien to widespread commerce and great foreign undertakings. Her success in the Messenian wars having assured a rich, extensive agricultural territory to exploit and vast numbers of subjugated peoples to employ as slaves or second-class citizens in farming, Sparta was not impelled to take an active part in the colonial politics of the rest of Greece, although Taras and Cyrene recognized her as their metropolis. All the efforts of this small tenacious populace were instead turned to the articulation and maintenance of a state organization marked by the greatest austerity and discipline. The famous codex attributed to Lykourgos typifies this regime which, in the framework of a strict class hierarchy, demanded extremes of virtue from its first-class citizens, at the same time elevating them and encouraging their fidelity by granting dignity and special privileges. The kingdom of Sparta has been quite justly but paradoxically defined as a socialist despotism of a strictly aristocratic character. Only the small nucleus of first-class citizens had the right to bear arms and join in the political life. The monarchic institution, a languishing and unnatural survival that sanctioned the immobility of Spartan political thinking, was a purely nominal rather than an effective agency. The first-class citizens (Spartiates), who lived on the work of their serfs (Helots), and the second-class citizens (Perioikoi) were, in a sense, slaves of the state, which regulated nearly all their acts with merciless rigor. This state regulation included complete charge of the education of children and the right to do away with offspring judged deficient.

The Spartan hegemony developed slowly and inexorably as the chief Laconian city gradually drew the lesser powers of the Peloponnesos into her sphere. Finally, when Corinth sided with the Peloponnesian League, the only notable Athenian ally left was Argos. Nor did Spartan power remain confined to the Peloponnesos, for by supporting Boeotian interests and through a veiled but pervasive influence over the oracle of Delphi, Sparta attained a position of central importance in the Greek world. Faithfulness to the heroic ideal, aristocratic traditions, and disdain for material gain and territorial expansion gave Sparta a unique character and incomparable prestige in

the eyes of all Greece. Undoubtedly, the guarded and reactionary conservatism associated with her politics in subsequent centuries was not yet manifest. Throughout the 7th century Sparta, in addition to political and military activity, intensified her relations with the entire Hellenic world and excelled in poetry and art. Surprisingly, it was the Ionian world of Asia Minor with which Sparta appeared most closely linked. The presence of such great artistic personalities as the poet Terpander of Lesbos and the sculptor Bathykles of Magnesia — the latter summoned for the construction of the altar of Apollo in Amyklai, one of the most famous and venerated works of all antiquity — provides some measure of the cultural level of the city. Similarly, the enormous production of carved ivory in Sparta during a very early period implies especially intense contact with Syria and Phoenicia; interruption of this activity in about the mid-7th century seems to correspond to the fall of Tyre. The quality of Laconian bronzes and pottery and their appreciable diffusion — the enormous and splendid bronze crater found at Vix (I, PL. 354) has been considered Laconian by some authorities — contribute to an image of the cultural attainment of Sparta quite different from that traditionally accepted.

The Athenians did not foster an excessive reverence for the past, as did Argos, or the preoccupation with civic and military obligations so identified with Sparta. Nor did Athens have the wide commercial interests of Miletos and Corinth. The early history of the city reveals consistent but unspectacular development, a measured progress never seriously impeded by disasters and political upheavals like those marring the history of other Greek cities. Changes of rule appear to have been effected by quiet transitions; moreover, according to legend, even the Dorian invasion was miraculously evaded. Athens seems to have assumed a leading position in the Geometric period, in so far as the elements of severe lucidity and rigorous logic governing this style found their highest expression and greatest center of diffusion there. The Geometric pottery produced in Athens not only expressed the characteristics of this phase most definitively but was also the most widely prized and exported ware in the rest of Greece. For a time Attic pottery yielded its sway to Corinthian exports, which in quality and volume became unrivaled in all markets. Nevertheless, even as a local phenomenon Attic pottery of the 7th and the early 6th centuries B.C., as revealed in modern discoveries and sustained by a different orientation of taste, has been judged one of the highest expressions of Greek art. Equally significant in the slow and enlightened advance of Attic power was the fact that, after centuries of quiet and concentrated preparation, Attic production began in the first half of the 6th century to impose itself everywhere, eventually to the point of annihilating the Corinthian industry and those of all other Greek centers.

For Greece as a whole, the 6th century marked a gradual fading of the great contrasts that the Greek cities, in their insistent affirmation of individuality, had formerly presented. Even in the 6th century the need to associate and to form units more comprehensive than the polis, which through leagues and amphictyonies emerged in the hegemonies of Sparta and Athens, also led to unifying tendencies in the artistic idiom.

Toward the middle of the 6th century, a new distribution of power evolved in Asia Minor. The prodigious growth of the Persian Empire by then threatened the sovereignty of the tolerant Hellenized kingdoms on whose margins the Ionian coastal cities prospered. With the downfall of the powerful kingdom of Lydia in 546, this threat became immediate. At first, by means of treaties and through nominal or partial subjection, the relations of Persia with the Ionian cities seemed to preserve the tolerance and mutual understanding that had existed with the kingdoms of Lycia and Caria. But soon the incompatibility of the Greek disposition toward freedom with the increasingly rigid centralization of the Persian Empire in the period of its greatest strength led to the desperate revolt of the Ionian cities and the destruction of Miletos in 499 B.C.

The danger arising to the east, however, did not disrupt the flourishing artistic and humanistic spirit of the Hellenic world. The greater part of the timeless artistic forms and principles attributable to Hellenic civilization evolved in this century: theater, architectural orders, and the Greek concept of the human form acutely perceived in naturalistic guise but expressing ideals of the universal and eternal, the essential and harmonious. Athens, moreover, became heir to the threatened Ionian culture; consequently the lucid, serene Attic spirit again represented a dominant note in the congeries of Hellenic cities.

The unsuccessful revolt of the Ionian cities had made the Persian menace even more imminent. Until the mortal duel with Alexander this vast empire, already firmly entrenched on the shores of the Aegean, comprised one of the constants in Greek politics, at once the barrier to and the aggressive threat of the Orient. For two centuries Persian influence or aid represented the deciding factor in the continually shifting balance of power in the wars between Greek cities. Although Athens at the height of her political glory was considered heir to the spiritual force of Ionia, Sparta was regarded as the heart and the bulwark of the Greek peninsula and was called upon to take the initiative in confronting the danger threatening all the Greeks. Persia, still a new empire vitally interested in permanent conquest, had become aware of how unstable was its hold over the Ionian cities of Asia Minor unless the Greek cities on the opposite coast were also captured or at least severely weakened. The rebellion of the Ionian cities had painfully demonstrated the impossibility of exercising tranquil rule over a freedom-loving people who, furthermore, were in continuous contact with their free brothers and sailed regularly among the islands and along the Aegean coasts.

The heroic marshaling of forces that ensued gave Athens her most glorious opportunity to affirm her spiritual authority over the Greeks and her mission as protector of Western civilization. At no time did Sparta display the same firmness and moral initiative, even in the most critical circumstances; the narrow and strongly domestic Spartan point of view had led her to dissociate her own political fortunes from those of the punished rebel cities. Even the Delphic oracle, which for generations had been under Spartan influence, did not raise its voice except to caution and utter veiled advice against such a tremendous military undertaking. Only Athens, with her resolution and calculated daring, knew how to implement the plans that carried the Greeks to victory despite the uncertainty and outright opposition of the Spartan commanders. A Spartan force provided an example of unflinching heroism at Thermopylai, but even this tragic and inspiring episode was largely the consequence of uncertainty and sluggishness on the part of the main body of the Greek army.

In the two great campaigns of 490 and 480 B.C., the Persian Wars in many ways represented the proving ground of the maturity and moral development of the Greek peoples. Politics, special interest, close calculation or an over-all outlook, and the uncertainty of the weak and immature, all these were relentlessly exposed by the awesome events of the time. It would almost seem as if the positions assumed at this critical moment by the various Greek cities determined their character and viewpoints for centuries after. There was the pacifism of Thessaly, and the neutrality of Argos, which because of irreconcilable hostility toward Sparta approached treachery. There was the indecisive yet tolerant human wisdom of the Delphic oracle, never forgetful of the deep respect shown by the Persians at the sanctuary of Delos. And there was the obstinate delay of Sparta and the generous imprudence and capacity for heroic sacrifice of Athens. Ultimately it was Athens that, in this supreme attack of the East on the West, took up the challenge and with glowing victories ended one of the most tremendous and fateful adventures in all history.

In this battle Athens showed herself ready to face any sacrifices, be they material or spiritual. Subjecting themselves to the supreme command of the rival Sparta and relying solely on their fleet, the Athenians sacrificed their city and the territory of Attica to Persian destruction. Since the great victories halting the Persian invasions — Marathon in 490 B.C., Salamis and Mykale in 480–479 — were essentially Attic victories attesting the efficiency of the Athenian fleet, it was to Athens that all Greece subsequently turned for political and moral

guidance. As a result, the Peloponnesian League under the command of Sparta was transformed into the Delian League under the supreme command of Athens. The Hellenic cities had recognized that the greatest threat to the Greek way of life would remain Persia and that the continuing arena of battle would be the sea. The shortsighted landbound policies of Sparta, which were tied to her immediate interests, and her exclusively land forces had proved inadequate against the great eastern adversary; and later a democratic uprising, headed by Argos, was organized in the Peloponnesos against Sparta. The Hellenic cities banded together to form a lasting maritime defense system against Persia, at first entrusting Athens with their ships and later — the result of an increasing sense of security — paying a tribute that permitted Athens to maintain an adequate force alone.

Thus Athens triumphed; and under her aegis for nearly a century, during what has come to be called the "classic age," the literary and figural arts as well as social and political institutions flourished. This constituted one of the rare periods in history when nearly all achievement seems to have been graced by incomparable nobility.

During the following decades, in an atmosphere still charged with success and exhibiting the most varied creative impulses, Greek political activity was marked by three constant elements: Persia, its incursions arrested but still a threat; the traditionalist principles of aristocratic and conservative Sparta; and the persistent democratic aspirations of Athens. In this unending political struggle two of the most famous Greek adventurers, Themistokles and Pausanias, were exiled from Athens and Sparta, respectively, and found honorable asylum with the Persian enemy.

In Athens the foremost political figure for about two decades was Kimon, son of Miltiades, the hero of Marathon and prince of Chersonesos; Kimon was himself an able and gallant general. Leader of the conservative faction, and therefore circumspect in his political acts, Kimon was accused of not making sufficient capital of the brilliant Attic victories over the Persians. In reality the hegemony of Athens was mainly, if not solely, exercised through the Delian League, or Athenian Alliance, whose justification and very reason for existence was the Persian threat. Under the leadership of a military man such as Kimon, with his politics of equilibrium and diplomatic consolidation, the league seems to have been drained of its purpose. He did not conceal his sympathy with the aristocratic traditionalism of Sparta and even sent a token Athenian unit to aid the long-standing Peloponnesian rival in the last Messenian War.

When external dangers had apparently been removed, or at least diminished, and vigorous and aggressive policies had been replaced by a general climate of relaxation and conciliation, the cities of the league began to find the supreme command of Athens an unjustified burden. This discontent resulted in a series of rebellions among the most powerful member cities, initially Thasos and Naxos. Many of the most famous and worthy generals and political figures of the country, among them Kimon, were ostracized. After the removal of Kimon, Perikles became almost the uncrowned king of the Athenian democracy for nearly thirty years. His authority was maintained by popular consensus through his repeated reelection to the office of strategos, a commander-in-chief or chief magistrate. This election was significant tribute from a politically sensitive citizenry to a benevolent, admirably detached leader — "Olympios" ("the Olympian") his contemporaries called him — who never actively sought the favor of his electorate. Under his enlightened and tolerant guidance, that marvelous balance between liberty and moral discipline which conditioned the spiritual and artistic development of Athens was realized.

More than a century before Alexander's expedition, clever imperialistic intuitions can be discerned in the foreign policy of Perikles. His aim was to consolidate the authority of Athens, to secure for his city a hegemony with a wider and firmer base of Panhellenic interests. Consequently there were impressive displays of force by Athens in the decade 460–450, with timely interventions of her renowned fleet in Egypt, Sicily, and at Naples. These efforts entailed a grave consumption of resources and caused huge losses among the Attic forces, pushed hard on many fronts, and the outcome did not at all justify the cost. The Attic expedition in Egypt was on the whole a failure; the only result of value, due mainly to the prestige of Athenian naval power, was a negotiated peace declaring the Aegean Sea out of bounds to Persian ships and concluding the wars of liberation against Persia. Final dissolution of the Delian League was marked by the transferral of the common treasury from Delos to Athens and the use of these reserves for the erection of the great chryselephantine *Athena Parthenos* of Phidias (III, PL. 385). Although a surprising gesture, this imposing commission was after all consistent with the Olympian temperament of Perikles, disdainful of both criticism and popular favor.

After contention with Persia was thus brought to an end with the Peace of Kallias and the century-long Eastern threat faded, the innate vitality of the Greeks, their cult of heroism, and aspirations to more encompassing hegemony seem to have impelled Athens to the thirty years of fratricidal war with the Peloponnesos. This long and exhausting war was fought on far-flung battlefields because of the scattered locations of the allies, and perhaps also because of their reserve in committing themselves fully and continuously. In fact, Athens and Sparta — the one with its mighty fleet, the other an invincible land power yet slow to organize and act — had no meeting ground in common. Another influence contributing to this prolonged contest was the moderate and generous conduct of the protagonists, or at least of the two principal rivals, notably the reluctance of Sparta to take part in recurring internal wars, despite vehement pressure from Corinth and Megara. The Peloponnesian War concluded with the disastrous Sicilian campaign, to which Athens had committed all her resources, and the staggering defeat of the Athenian fleet at Aigospotamoi. Moreover, Athens had been defeated on the sea, of which she had formerly held undisputed mastery. Thereafter, encouraged by new alliances and the use of Phoenician ships, Sparta entered a new phase of wide-ranging political activity.

During this long period, that is, from the time when the idea of a large-scale joint campaign against Persia took hold in the Hellenic world, the number of individualistic and contrasting artistic tendencies diminished, and artistic energies were channeled into broader, more unified currents. Perhaps the desire for unity that prompted establishment of the various hegemonies, leagues, or political alliances also served to undermine the jealously defended autonomy and creative individualism of the Hellenic cities. Toward the end of the 5th century the prestige and moral authority of Athens were such that the Attic dialect became the language of all Greece and Attic art ruled uncontested, its influence reaching even to such distant areas as the Peloponnesos and Ionia, themselves rich in local traditions. Paradoxically, this was the very period — the latter part of the 5th century, until the peace with Sparta in 402 B.C., which imposed hard conditions and signified the final relinquishment of Athenian aspirations to hegemony — in which Athens was struck by a series of unparalleled disasters. It is thus extremely significant that, in its acceptance of Attic supremacy in spiritual and artistic values, Hellenic civilization was apparently unaffected by the decline in Attic political fortunes.

In the early 4th century B.C., Greece was in a state of political anarchy and desolate from long internecine wars. Sparta, impoverished both in resources and manpower, faced new and difficult conditions, for which she was peculiarly ill-adapted and unprepared. The Sparta that had dared to challenge Athens on the sea found herself heir to the Ionian and Aegean policies and responsibilities of Athens. When Sparta intervened in Asia Minor against the Persians, the Ionian cities willingly returned to the comparative tolerance and perhaps only nominal authority of Persia in order to escape the heavy hand of the Lacedaemonians. Symptomatic of the confused and unnatural situation in Greece was the brief and paradoxical interlude of Boeotian hegemony. The triumph of Thebes was not due to moral superiority, effective power, or singular ability for ruling, as had been the case with Sparta and Athens, but was merely the result of the inspired maneuvering of Epaminondas,

the Theban general who defeated the Spartans at Leuktra in 371 B.C., and of the general exhaustion of the Greek world.

The short-lived Boeotian episode, however, provided significant testimony of a new orientation of the Greek political conscience toward the possibility of national unification, a policy purposefully adopted by Macedon later. This peripheral and barely Hellenized state, after being unified through the efforts of Philip II in the mid-4th century, introduced itself into the very heart of the Greek community with its well-calculated intervention on behalf of the Delphic sanctuary, lately occupied by the Phocians and its treasury exhausted.

With Greece in this state of confusion and political anarchy, a strong unified state with an excellent army and a gifted, ambitious monarch, must inevitably gain military and then political dominion. The struggle was harsh and unceasing, however, since for many Greeks the prospect of losing their political liberty was so terrible that they even sought the aid of Persia, a choice that at the moment seemed less risky. With ruthless campaigns and skillful diplomacy Philip succeeded in reuniting Greece and then took on the task of confronting the age-old Eastern enemy. His ultimate success came with a general alliance of the Greeks, under Macedonian command, against the Persians. Soon afterward Philip was killed by a hired assassin (336), and the twenty-year-old Alexander became king and found himself faced with grave responsibilities. In this crisis as well, the solidarity of the Macedonian army and the military prestige of the new king turned aside all threats.

Everything about the life of Alexander, even when viewed by the cold eye of the historian, has an air of the fabulous. Apart from the wonders that supposedly marked his birth and adolescence, even Alexander's first military action — a lightning expedition into Thrace, from which he returned victorious after news of his death had already coursed through Greece and reawakened hope among the liberals — seemed to herald his epochal mission. The war against Persia was nominally waged by all Greece but was in actuality sustained only by Macedon. Since Persia had become a formidable maritime power and Athens did not want to commit her fleet to the conflict, Alexander was forced to conquer the entire Mediterranean coast as far as Syria and Egypt and to destroy the ports where Persian ships might find refuge. While the incredible series of victories and advances can to some degree be credited to the splendid efficiency of the Macedonian army, the inexplicable and deciding factor was the personality of Alexander, his extraordinary personal magnetism, military genius, and magnanimity as a conqueror. All doors seemed to open, all obstacles to disappear before him. Besides his legendary battles, from Granikos to Gaugamela (where Darius was decisively put to flight), the significant events of his career included his pilgrimage to the tomb of Achilles at the promontory of Sigeion; his adoption by Ada, princess of Caria and sister of Mausolos; and his visit to the Libyan oracle of Zeus Ammon, which proclaimed him the legitimate heir of the Pharaohs. After the death of Darius, Alexander was proclaimed king of Persia, and with daring expeditions to India and central Asia he reconstructed the shattered empire of Darius.

In 323 Alexander, only thirty-three years old, died in Babylon, where he had established the center of his immense empire; he left unrealized his grandiose plans for new conquests and political organizations. With his death a new period of turmoil and political cataclysms began. As head of the immense and disorganized empire, there remained initially Alexander's deficient brother Philip Arridaios and later Alexander IV, his posthumous son by Roxana — both too feeble to withstand internal revolts and the ambitions and quarrels of Alexander's brilliant generals. Consequently the empire was soon broken into a number of more or less Hellenized autonomous states once more, the most stable and important of which were Syria under Seleukos I and Egypt under Ptolemy I.

Whatever the evaluations of Alexander's undertaking may be from a strictly political viewpoint, there is no doubt that its moral and cultural effects have been of fundamental importance in world history. The brilliant attempt to reconcile in a single immense empire the age-old conflict between the Greek world and the Persian Empire was fatally bound to the person of Alexander and thus had a life as brief as his. However, elements of Hellenic culture had already been successfully engrafted on old Asiatic stocks as far as India and central Asia, where they developed in a variety of ways, at times curiously hybrid but sometimes coherent and charged with new vitality.

The formation of new Greco-Asiatic monarchies in Syria, Egypt, and Asia Minor produced a complete revolution in the conditions of life, in artistic development, and in Greek culture. As might be expected, new vital forces from the older Greek territories gravitated toward these new centers, which were richer and more promising than the cities of the mother country, exhausted by wars and revolts. The luxurious new courts patterned on Oriental traditions, and the centering of attention on the person of the sovereign, postulated a new artistic orientation. In place of the sanctuary and cult worship, the monarch, court life, and a feudal organization became the focal elements of artistic activity. The tendency to secularize the arts that had been encouraged by the highly cultivated Alkibiades, who had even dared to hang paintings in his house, became firmly established. Artists were called upon to create works for luxury purposes and purely for man's enjoyment. The abandon and charm of the art of this "Hellenistic" period became the koine of the entire Mediterranean world and a large part of western Asia. The great creative centers of the era were Alexandria, Rhodes, and Pergamon, while Greece proper appeared spent from the desperate fight to maintain its political liberty.

The Hellenistic period in Greece was characterized by alternate phases of surprising vitality and political importance among various peripheral groups. After the ascendancy of Macedon came that of Epirus, whose King Pyrrhos fought the last battle in defense of the Greek world in Italy and Sicily in 279 B.C. Politically important also were the Aetolians, a mountain people who played an influential role in a great anti-Macedonian coalition.

The Romans intervened in Greece when they defended the island of Kerkyra and its colonies against the raids of Illyrian pirates. Subsequently reverberations of the Punic Wars, the occupation of Syracuse, and the alliance of Philip V of Macedon with Carthage inevitably brought about increasing penetration of the Romans into Greece. In its constant opposition to Macedon, the Achaian League was the unwitting instrument of Rome, which upheld the league's aspirations to liberty until, with the final defeat of Perseus of Macedon at Pydna (168), its cities were completely occupied. An Achaian uprising ended in the complete destruction of Corinth in 146 B.C. and a decrease in civic autonomy. Greece's final attempt to regain her liberty after the war of Mithradates ended with the campaign of Sulla and the conquest of Athens in 86 B.C.

During the Roman occupation there was a partial return to cultural standards of the past. In Alexandria a new library was attached to the Serapeion to hold the overflow of manuscripts from the famous museum and library founded by Ptolemy II and burned in the Caesarean war. In this era of classicism and academism, Athens once again became the spiritual capital of the world. The activity of Athenian sculptors undoubtedly contributed to the defeat of Hellenistic tendencies in art and to the reestablishment of pure classical traditions, unfortunately devitalized in the form of faithful but mechanical copies.

Enrico PARIBENI

GREEK ART AND THE MODERN WORLD. For centuries after the dissolution of the Roman Empire no clear distinction was made between the civilizations of Greece and Rome other than the obvious one, evident from their languages and writing, that the Greeks and Romans were different peoples with different origins. Greece and Rome were together regarded simply as classical antiquity. As the West lived in the Latin tradition, so the East continued the Greek; Christianity at its beginnings had Greek as well as Roman Church Fathers. In the Byzantine world, the numerical superiority of Greeks over Romans in what had formerly been the eastern half of the Roman Empire ensured the uninterrupted continuation of Greek culture — although modified by Eastern elements and the vicissitudes of history — until the Turkish conquest, when the Byzantine dominion was sharply reduced and afterward, with the fall of Constantinople in 1453, entirely destroyed.

Constantinople, the ancient Byzantium, although founded by the Greeks, had conserved no Greek buildings within its walls. Some masterpieces of ancient Greek sculpture did, however, find their way to the city: for example, the chryselephantine statue by Phidias from the Temple of Zeus at Olympia, taken to Constantinople after the abolition of the Olympic games in A.D. 394, and the serpentine bronze column, a votive offering for the victory of the Greeks at Plataia, which came from the sanctuary of Apollo at Delphi and has remained in Istanbul. In Asia Minor and especially on the Greek mainland, vestiges of Hellenic monuments survived. After the outlawing of pagan cults by the edict of Theodosius II in 426, which ordered the destruction of the temples, the venerable sanctuaries of Delphi and Olympia fell into decay and were subsequently destroyed by earthquakes and landslides. In Athens, however, most of the sacred buildings remained intact, despite later transformation into Christian churches, mosques, harems, or fortresses. The Parthenon was not seriously damaged until the Venetian siege of 1687. For the medieval period, there is almost no information concerning the preservation of ancient Greek monuments. Only a few isolated travelers, among them Cristoforo Buondelmonti (b. ca. 1380–90) and Cyriacus of Ancona (1391–ca. 1455), are known to have visited Greece, and especially the islands; and their travel descriptions do not date before the early 14th century.

The Latin west, on the other hand, became ever more Romanized throughout the Middle Ages, and ancient traditions were filtered through Rome until the time of the Italian Renaissance. Formed in part of Greek elements, Rome was the mediator for the spread of Greek values throughout the Latin west. Still, although some direct contacts with Greek ideology did exist — among others, the emperor Otto III, whose mother Theophano was a Byzantine princess, knew Greek as well as Latin — most Greek elements appeared throughout the medieval west in Roman disguise. Thomas Aquinas, for example, read Aristotle in Latin translation and resorted to this version as if it were an original document. The ancient gods and heroes were usually given Latin names and Roman dress — if they were not so changed in nature as to become mere demons (e.g., Phoebus Apollo). Only Venus and Cupid retained their traditional attributes and gave the poets an opportunity to invoke beauty and eroticism in a form that indirectly reflected antiquity. Greek fables deriving from Aesop, current in Latin versions, not only were widely used as school literature but were so popular that they are evidenced even in the sculpture of medieval churches. Great figures of antiquity such as Pythagoras, Plato, Aristotle, Hippocrates, Euclid, Archimedes, and Apelles were also represented on buildings of the Christian west, for instance, on the west and north portals of the Cathedral of Chartres.

Monuments of Greek architecture survived in southern Italy and Sicily but for centuries had no influence on western culture, since these territories gravitated largely toward the Byzantine and Islamic world during the medieval period. Greek sculpture was almost unknown. The *Boy Removing a Thorn* of the Palazzo dei Conservatori, Rome, and the *Dioscuri* on the Quirinal, though already known (the latter bore the inscriptions "opus Fidiae" and "opus Praxitelis"), were probably not recognized as Greek-inspired works. In a manuscript preserved in Cambridge, Magister Gregorius, a traveler in 13th-century Rome, wrote an extensive and lively appreciation of a nude Venus. This need not have been a Greek statue, however, and it is improbable that his subject could have been the Capitoline *Venus*. Therefore it cannot be claimed that such interest marked the beginning of an awareness and an appreciation of Greek art.

The first direct and authentic contacts with the Greek way of life were through the work of the Renaissance Humanists, who studied the language and salvaged the original texts (see HUMANISM). Petrarch owned Greek manuscripts of Homer and Plato. Essentially Latin in temper and unable to read Greek, Petrarch nevertheless became vitally interested in Greek letters by way of texts sent to him by the Calabrian monk Barlaam and the Byzantine Sygeros. In a letter thanking Sygeros for the gift of a codex of Homer, Petrarch expressed gratitude that the text had now been given to him "... not forced into the artificial channels of an alien language, but pure and uncorrupted in its Greek eloquence, just as it flowed from that divine genius" (*Familiarum rerum*, xviii, 2, 6). As insignificant in impact as this letter was when it was written in 1354, all the greater is its importance for the history of the rediscovery of Greek culture. Perhaps even more than Petrarch, Boccaccio may be praised for having various Greek authors (including Homer) translated into Latin and for even quoting from the Greek, a device unheard of at the time.

From the time of Petrarch and Boccaccio, and especially after the conquest of Constantinople by the Turks in 1453, there was a steady westward migration of Greek teachers that stimulated the rediscovery and rebirth of Greek culture in 15th-century Italy. It was in the Academy of Florence, founded under Cosimo de' Medici by Georgius Gemistus Pletho, that the new interest in Greek produced its first important result, the Platonism of Marsilio Ficino (1433–99). Not long afterward, however, in the 1520s, Italian interest in Greek studies was already dying out, in part because of the death of the refugee scholars from Constantinople.

Throughout this period there was not yet a genuine knowledge of Greek art. Lorenzo Ghiberti owned some classical sculpture, possibly including the so-called "Ilioneus" (Munich, Glyptothek; no. 270). For the figure of Isaac in his famous contest panel of the Sacrifice of Abraham, Ghiberti was probably inspired by an antique statue. The Belvedere torso (PL. 367) was in the possession of the Colonnas in 1430. At the end of the 15th century the *Apollo Belvedere* (III, PL. 383) was found, and in 1501 the "Pasquino," a fragment of a Hellenistic group, probably Menelaos with the body of Patroklos, was exhibited in Rome in its present location outside the Palazzo Braschi. In 1506 the most famous of these finds, the *Laocoön Group* (PL. 189), came to light in Nero's Domus Aurea. Among the first to admire this work was Michelangelo, who was also greatly impressed by the Belvedere torso and clearly learned much from both of these late Hellenistic originals. It must be remembered, however, that at this time these were accepted merely as works of classical antiquity, not as specifically Greek works. Both the Renaissance and the baroque era were to pass before there was a true recognition of Greek art.

The literary preparation of the rediscovery of Greek art is, therefore, of extreme importance. In the 16th century, scholars outside Italy were studying the Greek language and literature as well. In particular, Huguenot France and Lutheran Germany during the Reformation accepted Greek as the lan-

guage of the New Testament, of Plato and Aristotle, in contrast with the Latin of the Roman Catholic Church and medieval tradition, as has been pointed out by Werner Jaeger. On the advice of Guillaume Budé, Francis I founded the Collegium Trilinguae, the present Collège de France, in which Greek as well as Latin and Hebrew were taught. In 1572 Henri II Estienne, under the Latin name Stephanus, edited the first edition of a *Thesaurus linguae Graecae*. In 1525 Melanchthon performed the *Hecuba* of Euripides at Wittenberg, in the translation of Erasmus, an important beginning for the rediscovery of Greek tragedy; but the endeavor was not pursued further until Lessing. Moreover, none of these Humanistic writers mentioned Greek works of art. Isolated signs of influence can be found in the work of individual Renaissance artists such as Ghiberti and Michelangelo, who have already been mentioned. For a drawing by Albrecht Dürer (Br. Mus.) that bears the inscription "Apolo" a derivation from the *Apollo Belvedere*, by way of an etching from the circle of Mantegna, has been suggested.

During the baroque period, acquaintance with Greek sculpture — either directly or through faithful copies — continued to grow in Italy. Among the most famous of the works rediscovered were "The Dying Gaul" (PL. 164), the Capitoline *Aphrodite*, and the *Boy Strangling a Goose* after Boethos (cf. VI, PL. 58), all now in the Capitoline Museum; the Barberini *Faun* (PL. 169); the Kassel *Apollo*, deriving from Phidias (III, PL. 353); and the *Aphrodite* by Doidalsas in the Vatican Museums. For the most part they correspond to works of a late Greek period which has been descriptively termed the "Greek baroque." Were these similar discoveries pure coincidence, or was attention focused on sculpture particularly close to the taste of the times? In any case, the finds were far richer than this summary indicates. So many statues were salvaged that Cardinal Ludovisi was able to collect more than 300 pieces in a single year (1622–23). The Albani family also formed a large collection of ancient sculpture in the 17th century, which in 1733 was added to the Capitoline collections. Still, however, these were regarded as the works of antiquity, not specifically as "Greek art."

In France, too, interest in the antique was concentrated on the Roman. All the more noteworthy therefore is the French classicist Racine, who, in opposition to the traditional "Romanist" Corneille, appeared as an isolated Hellenist. He translated parts of Plato and Aristotle's *Poetics* into French, had a special love for Euripides, and was the first to discover the "tragic" in Greek drama. For the rediscovery of ancient Greek buildings and monuments, the age of Louis XIV was exceptionally important. At that time the Marquis de Nointel was French ambassador to the court of the Ottoman sultan in Constantinople. The marquis passed through Athens, and included in his retinue were Cornelio Magni, who described the places they saw, and a number of painters and draftsmen. Among these artists was a Fleming (formerly identified with Jacques Carrey) who made the famous drawings (Paris, Bib. Nat.) of the pediment and metope sculptures of the Parthenon as they appeared before the devastating explosion of 1687. Regarding the growing number of visitors to Greece, particular mention should be made of the sojourn of Jacques Spon (ca. 1675), a doctor of Lyons who, traveling with the Englishman George Wheeler a year or two after Nointel, observed the country and the monuments with the objective attitude of the interested scholar and studied topographical problems, buildings, inscriptions, and coins; in a sense, he created that study of the visible remains of the ancient world which has come to be known as archaeology. He was also one of the first to use the terms "archaeologia" and "archaeographia."

It was not until about the middle of the 18th century that explicit awareness of the importance of Greek culture as the source of the essential spirit of the ancient world arose. Johann Joachim Winckelmann (1717–68) is commonly placed at the beginning of this intellectual movement and acknowledged the initiator of a new epoch. He may rightfully be considered the founder of the scientific history of ancient art, and more particularly of Greek art; that trend which led to the prevalent classicistic taste of the early 1800s (see NEOCLASSIC STYLES) may be traced to his intense interest. Undoubtedly this movement was generally inspired by acquaintance with the sculpture, which encouraged investigation into the essence of the Greek spirit. It should be noted, however, that Winckelmann himself was originally captured by Homer's poetry and that his interest in Greek sculpture developed later. When still a boy, with prophetic instinct he persuaded his parents to send him to a Latin school; and in 1735, at the age of eighteen, he went to Berlin to further his study of Greek literature at the Gymnasium of Cologne, under the guidance of C. T. Damm (1698–1778). The recognition of the importance of Greek culture seems to have been a turning point not only for Winckelmann but for all of modern culture. Winckelmann's generation and that immediately following witnessed the emergence of Greek philology, studied by a series of scholars that culminated with the great figure of F. A. Wolf (1759–1824).

Winckelmann had as yet seen few ancient works of art, and strangely enough had paid little attention to the statues in Dresden he could have studied at close range, when in 1755, in his *Gedanken über die Nachahmung der griechischen Werke in der Malerei und Bildhauerkunst*, he wrote "The only way for us to become great, even inimitable if possible, is by imitating the ancients . . . and particularly the Greeks." In addition to noting the "antiquities" of Dresden, these writings contain specific mention of the *Laocoön*, which Winckelmann evidently knew through a copy. Nor was it only for Winckelmann that the *Laocoön* was the first work of Greek sculpture to achieve such importance; Lessing entitled his important treatise on esthetics, published in Berlin in 1766, *Laokoon oder über die Grenzen der Malerei und Poesia*. Although taking issue with Winckelmann, Lessing sided with him in the fight against the Roman orientation of French baroque classicism and also urged the renewal of the ideals of Greek art. And in 1798 Goethe dedicated an essay on esthetics to the *Laocoön*, a critique published in the classical periodical *Propyläen*. It may seem strange that a late Hellenistic work created at the end of the Greek development should have provided the stimulus and the archetype for exaltation of the Greek sculptural ideal. Nevertheless, the Belvedere torso was equally admired, and it would be a distortion if this phenomenon were to be attributed solely to the meager knowledge in the second half of the 18th century of classical Greek works of the age of Perikles, or to the fact that archaic sculpture had not yet been discovered. More properly, it should be remarked that the late baroque was still bound by intellectual and esthetic affinity to the creations of the Hellenistic period.

Winckelmann's first contact with the *Apollo Belvedere* and his Roman stay, beginning on Nov. 19, 1755, resulted in a new appreciation of Greek art of the 4th century B.C. and ultimately in the writing of his masterwork, *Geschichte der Kunst des Altertums* (Dresden, 1764), If the undiscriminating, encyclopedic attitude of the baroque world toward antiquity is borne in mind, the novelty of Winckelmann's work lies precisely in his having recognized and evaluated the sculpture of the ancients as works of art. On the one hand, he adduced ideal esthetic canons; on the other — and on a more historical level — he discerned a progression in the development of ancient art. When Winckelmann contemplated the course of this development and remarked that the purpose of art is beauty, or when, inspired by Polybius, he spoke of the role of geography and climate in the evolution of Greek art, he evidently formulated his esthetic criteria directly from Greek ideas. Moreover, his historical instinct, inclined to interpret events as a natural life process, places Winckelmann in a leading position in the development of historism (F. Meinecke).

The direct successor to Winckelmann was Goethe. It might even be asked whether, without this apostle, Winckelmann's fame and influence would have subsequently become so great. Goethe's interest in Greek sculpture also began with the *Laocoön*; and as with Winckelmann, his taste developed and refined with time, especially during his trip to Italy. Of still greater significance for Goethe's conception of the Greek world was his acquaintance with the large volume of plates illustrating the sculpture of the Parthenon published in 1816 by Thomas

Bruce, Earl of Elgin. In a letter of July 27, 1817, addressed to the "Verein der Deutschen Bildhauer," Goethe warmly advised artists to study and draw the Parthenon sculptures with exactitude. He was convinced that the smallest and most damaged part would teach them something, appending, however, that it was not actually necessary to become "a Phidias." In place of the slavish imitation advocated by Winckelmann, Goethe now emphasized the need to learn from the Greeks in order to produce in a manner faithful to the classical spirit and ideals. Goethe had advanced this idea earlier when he said of Raphael that he never "Grecized" but thought, worked, and felt like a Greek.

Winckelmann and Goethe can hence be considered the discoverers of the "Greek" for the modern phase of the cultural history of the Christian West. It should be emphasized, however, that this was an essentially intellectual discovery. Neither Winckelmann nor Goethe ever visited Greece, much as they desired and planned to do so. Winckelmann saw only Paestum, while Goethe was able to visit Sicily as well. The latter's understanding of Greek art was profoundly influenced upon seeing the Temple of Poseidon at Paestum. He said of this temple that it was the most magnificent "idea" (*die herrlichste Idee*) that he carried back across the Alps.

Paestum was the most accessible site for western Europeans to view and admire Greek architecture. The Neapolitan architect Mario Gioffredo (1718–85), after a visit to Paestum in 1746, published information on the architectural orders of the Greeks. He was followed there, in 1750, by J. G. Soufflot, the builder of the Paris Panthéon, traveling in company with G. P. M. Dumont, and in 1758 by Winckelmann. By about the middle of the 18th century journeys into Greece itself were becoming more frequent, and noteworthy visitors included the following figures: in 1749, R. Dalton (1715–91); in 1750, the architect J.-D. Leroy (1724–1803); and in 1751, the painter J. Stuart (1713–88) and the architect N. Revett (1720–1804), who published reproductions of Attic and Cycladic monuments under the title *The Antiquities of Athens* (London, 1762–1816). These and other names highlight the decisive efforts made in the 18th century to rediscover the Greek world.

From that time the number of visitors to Greece increased steadily, and with them the appreciation of Greek art and the study of the land and monuments. Beginning in the 19th century, important archaeological excavations on Greek soil furthered the knowledge of classical remains (see ARCHAEOLOGY: RESEARCH AND DISCOVERIES). Whereas Winckelmann was barely acquainted with Greek sculpture of the classical and archaic periods, Goethe in his old age was able to admire, at least in reproductions, the metopes and pediment sculpture of the Parthenon, the reliefs of the Bassai frieze, and the late archaic sculpture of the Aegina pediments. Greek pottery began to be known — and to be recognized as such — only after 1828, owing to finds in Etruscan tombs. Then, in 1871, the first Geometric vases were found near the Dipylon of Athens. Archaic sculpture was brought to light in the years 1886–88 with the salvaging of the kouroi of the Acropolis. Finally, also in the last decades of the 19th century, and with results beyond all expectation, Greeks, Americans, Germans, English, French, and Austrians vied with each other in exploration of the sanctuaries of Argos, Delos, Athens, Delphi, Dodona, Eleusis, Epidauros, Kerkyra, Corinth, Olympia, Pergamon, Priene, Perachora, Samos, and others, all rich mines of art treasures.

After the generations of Winckelmann and Goethe, however, discoveries of the vestiges of antiquity lost that immediate fascination which has significant effects upon culture and artistic expression. In the course of the 19th century, historical research and artistic taste followed paths that were often divergent, if not completely opposed. This separation went so far that the art scholar Alois Riegl (1858–1905) eventually asserted that the best art historian was he who had no personal taste. Archaeology and the preservation of ancient monuments became more organized pursuits, with more funds allocated to their purposes. In 1828 young scholars and friends of antiquity in various countries of the world founded the Instituto di Corrispondenza Archeologica in Rome, with chapters in Germany, England, and France. The Deutches Archäologisches Institut followed, also in Rome, with a second seat in Athens established in 1874. A generation earlier, France had already founded a French school in Athens, followed in 1882 by an American, in 1885 by a British, in 1898 by an Austrian, and in 1928 by an Italian school; all were dedicated to the study of Greek archaeology. In 1837, shortly after the restoration of their independence, the Greeks themselves had founded an archaeological society of similar intent (see INSTITUTES AND ASSOCIATIONS). The value of many important finds made on Greek territory by these institutions was not immediately recognized. Although the sculptures of the Temple of Zeus at Olympia, together with those of the Parthenon in Athens, have come to be considered among the finest surviving works of Greek sculpture, at the time of their discovery the later *Hermes* of Praxiteles aroused much greater admiration. The archaic works excavated on the Acropolis also were at first received coolly, as the Aegina sculptures had been in the time of Goethe.

It is, of course, most instructive to concentrate not upon the general taste of the time but upon the reactions of the most creative spirits brought face to face with Greek art during the century and a half following the period of Winckelmann and Goethe. Winckelmann's exhortation to imitate Greek works had met with a receptive and willing audience not only among sculptors but architects and painters as well. Such copying was pushed to the ridiculous by his friend in Rome, Anton Raphael Mengs (q.v.), who painted *Jupiter and Ganymede* (V, PL. 228) "in the Greek style" and had it brought to the attention of the unsuspecting Winckelmann, who in turn published the falsification as a Greek masterpiece. Leo von Klenze (1784–1864) imitated the Parthenon in his Walhalla near Regensburg (I, PL. 305), and the Swiss Peter von Nobile (1774–1854) the Theseion in his Theseus Temple in the Vienna Volksgarten (1820–23). It is interesting that Nobile reproduced a Greek Doric temple, while in Paris the almost contemporary Madeleine imitated a Roman podium temple. In the Ingres *Oedipus and the Sphinx* (1808), the figure of Oedipus was inspired by Greek sculpture seen at the Louvre. Canova in his *Perseus* (1800) and Thorvaldsen (qq.v.) in his *Jason* (1802–28) derive their figure types from the *Apollo Belvedere*. The *Jason*, moreover, shows a clear Polycletan influence. Thorwaldsen, when old, confessed to having hated this statue into which he had put all he could assimilate from the antique, without the least personal inspiration. The lack of artistic truth in such slavish imitation of the classical Greek could find no clearer statement. Nevertheless, its powerful attraction is demonstrated by the persistence of classicizing tendencies in Germany throught the 19th century.

The Latin countries reacted more quickly against the classicism of Winckelmann's followers, in such biting commentary as the lithograph caricatures of ancient mythology by Daumier (q.v.). Their mockery is, however, most likely directed against the falseness of the assumed "Greek style" of the classicists rather than against the Greeks themselves. With Aristophanes, after all, Daumier had a close kinship. For Rodin (q.v.), the leader in France of the romantic anticlassical school of sculpture of the late 19th century, sculpture was an art of convexities and concavities, of representing forms in a play of light and shadow. He favored photographic reproductions in which his statues were in part brilliantly illuminated and partly immersed in darkness. The contrast with Greek sculpture could not have been greater.

Immediately following Rodin, there was a reaction against this almost painterly romanticism in sculpture, a change exemplified by the work of Aristide Maillol (q.v.), who favored figures that were solid, heavy, and bulky. Karl Scheffler wrote that an ancient Greek reborn in modern times would work like Maillol. In company with the poet Hugo von Hofmannsthal, Maillol visited Greece in 1908. Unfortunately, the sculptor's impressions are not recorded, but perhaps they are reflected in his poet companion's *Augenblicke in Griechenland*, where he wrote: "Our washed-out Winckelmannesque vision, which brought the beautiful too close to the charming — charm lacking nerves and marrow — too close to Canova, and which still

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

lurks somewhere within us, had made us forget how closely related beauty and power really are." Of the archaic kouroi, Hofmannsthal wrote, "They have a breathtaking sensual presence . . . there is a tension in this material, so powerful that it also grips me. I have never before seen anything like this mass and surface." In such phrases, one seems to hear Maillol express his sculptural ideal. Like Maillol in France, Gerhard Marcks in Germany signified the departure from the preceding impressionistic sculpture and a conscious return to the sculptural principles of the Greeks in the archaic and classical periods — namely, to a monumental, tense, and cubical handling of form. Like Maillol, Marcks turned to the Greeks for inspiration, without mechanically imitating them, however. He often visited Greece and found there, as he said, "not the classical form, but the classical way of life."

This kinship with the classical spirit has continued into the 20th century. The work of modern sculptors such as Jean Arp, Marino Marini (qq.v.), and Bernhard Heiliger, while devoid of classicized subject matter and form, retains much of the essence of Greek sculpture. There are still other sculptors who revived ancient themes and Greek devices, in order to treat them in an expressionist manner. Thus O. Zadkine, using the late Hellenistic composition of the Three Graces, showed it to be a subject still capable of vital reworking. Zadkine also created a variation of the Greek Orpheus theme in which he distorted the human figure and fused it with the conventional attribute of the lyre in a way completely opposed to the conception of the Greeks; yet he created a convincing symbolic expression of the all-consuming power of music, the meaning of the Greek myth of Orpheus. In a final analysis, however, with its dissolution of the integrity of the body, this figure was in marked contradiction to the Greek tradition.

Up to this point, what might be called the history of the Greek spirit "as action," according to the definition of Benedetto Croce, has been considered particularly in relation to the work and critical response of the artists when confronted with the sculptural ideal of the Greeks. Now the general history of the very concept of the Greek way of life must be considered. What insights and opinions concerning the essence and development of Greek art have been arrived at by the scholarly research and philosophical interpretation undertaken by the great intellects since Winckelmann?

First, let us recapitulate Winckelmann's ideas on the place of Greek art in the history of world art, which he views as following a cycle of birth, growth, suspension, and decline. The arts began with the essential, then sought the beautiful, and in the end concentrated on the superfluous. From the arrangement and order of his work *Geschichte der Kunst des Altertums*, it can be deduced that according to Winckelmann's concepts — which remained constant throughout his life — the arts of the Egyptians, Assyrians, Phoenicians, and Persians (that is, the arts of the ancient East), although they advanced somewhat, did not succeed in getting very far beyond an initial stage of development. When he wrote that art under the ancient Egyptians did not reach the high level it attained under the Greeks, Winckelmann did not intend to suggest that Greek art derived from and was simply an advancement over the Egyptian. On the contrary, he insisted that the Greeks did not take the seeds of their art from any other peoples but were themselves the innovators in their earliest images. Through rapid growth they then attained the apogee, the middle of the three principal stages of art — namely, the seeking of the beautiful. With the Romans the art of antiquity reached the stage of decadence and eclipse. Hegel, in his *Philosophie der Geschichte*, adapted Winckelmann's historical concept to the succession of the ages of human life. The Oriental was its infancy, the Greek world its youth, the Roman Empire the manhood, and the Germanic successor states its old age. In his esthetics, with more logical consistency, he made three formal distinctions: the "symbolic art form," which he found above all in the East; the "classic art form" of Greece; and the "romantic art form," which he associated with works of the Christian West. Hegel considered the acme of art to have been realized by the Greeks.

During the 19th century the search for Greek values decidedly took a first place among Winckelmann's successors and, in the general field of archaeology, among the successors of F. A. Wolf. Alongside the professionally dedicated students of antiquity Friedrich Schlegel (1772–1829), who wanted to become the "Winckelmann of Greek poetry," must also be remembered. During the first half of the 19th century, philological and historical studies of antiquity markedly predominated over archaeological research proper. With the truly important works by Wolf's immediate disciples, such as A. Boeckh (1785–1867) and A. I. Bekker (1785–1871), and with those of F. G. Welcker (1784–1868) and K. O. Müller (1797–1840), a student of Boeckh, such writers as L. Ross (1806–59), E. Gerhard (1795–1867), and A. Blouet (1795–1853) could in no way compete. Conversely, in the second half of the century it was the archaeologists who became preeminent in the study of classical antiquity. Among these were H. von Brunn (1822–94), A. Furtwängler (1853–1907), W. Dörpfeld (1853–1940), and P. Orsi (1859–1935). These archaeologists turned their interests exclusively, or primarily, to Greek art. But it was F. Wickhoff (1853–1909), an art historian rather than an archaeologist, who first drew attention to the distinctive characteristics of Roman art, in a memorable introduction to the publication of the Vienna Genesis manuscript in 1895, thus opening the way to the wide-ranging modern interest in non-Greek aspects of ancient art.

The emphasis that, beginning with Winckelmann, had been placed on the "golden age" of Greece shifted during the first half of the 19th century toward the darker, more primitive aspects of Greek civilization. In the first decade of the century, J. Zoega (1755–1809) investigated the prehistoric stages of Greek mythology and religion. A half century later, J. J. Bachofen (1815–87) studied problems concerning the primordial forces of the earth, primitive man, eternal origin or creation, and funerary practices. Finally, Jakob Burckhardt (1818–97), in a lecture of 1875, placed in the mouth of the Vatican *Hermes Psychopompos* these pessimistic words: "We blessed Olympians lived only for ourselves and made all others suffer. We were not good and so we had to perish."

Winckelmann's statement that the prime quality of Greek art was a noble simplicity and serene grandeur both of attitude and expression was so overworked during the 19th century that it has come to seem false — merely a pleasant classicistic illusion. But it must be remembered that this statement, reflective of his time, was directed against the agitated, coloristic effects of late baroque art. Winckelmann's thesis that the noblest aim of art is beauty is more defensible outside the historical context of his period, but this formula has also been abused by time. Winckelmann distinguished true beauty from the beautiful style, which pursued charm and lightness, and from personal inclination or taste, which distracts our spirit from true beauty. What he intended was the Platonic concept of the gradual ascent of human beauty to the supreme beauty, which is in God and which according to Winckelmann "has no form." The Platonism determining Winckelmann's ideas on beauty as the supreme end of art remains valid for definition of Greek art of the classic period.

To Eckermann, Goethe expressed himself in a similar way (1828): "He who wishes to attain something great must first have enriched his own formation so as to be able, like the Greeks, to elevate the lesser reality of nature to the height of his own spirit, to make actual that which — due to internal weakness or an external obstacle — has remained in its real appearance only an intention." What Goethe meant by this reference to the Greeks is perhaps clarified by the fact that he called the horse's head from the chariot of Selene on the east pediment of the Parthenon *Urpferd*, an image expressing in an absolute sense that which is intended in nature's imperfect examples. Ernst Buschor, in his interpretation of this and analogous passages of Goethe, speaks of a "supernature" (*übernatur*), or a "world of order and perfection," and in another phrasing, of "the existing world of that which is becoming" (*Seinswelt der Werdenden*). That beauty which for Winckelmann is the ultimate end in art also exists in this world of the becoming. Goethe interpreted the activity of the Greek artists as a "constructing of reality," which depended on the spirit, intuition,

and ideas, not on a mirroring of nature. In other words, the Greeks did not imitate nature but expressed the true reality. To reach this ideal level, it is not a sufficient purpose in art merely to strive for a pleasing object, for the work of the artist regardless of inspiration must emerge as an independent and strongly felt creation.

Buschor, in his already quoted interpretation, pointed out still another of Goethe's opinions: "I have the feeling that they [the Greeks] acted according to the laws which nature herself follows"; he called this "Goethe's discovery of the ancient Greek world of the physis" in Greek sculpture. Although Buschor perhaps went a little too far in this interpretation, still this and other passages show that Goethe had perceived a basic characteristic which distinguishes Greek sculpture from that of post-antiquity — its naturalness and reality. Confronted with Greek works, Goethe felt himself in immediate contact with their values and creators. Of the columns of the Temple of Poseidon in Paestum he said: "Only by moving around them, wandering in between them, can one partake of their own proper life. That which the architect intended and realized is felt to emanate from them." A visitor recounted the reactions of the poet before a copy of the *Ilioneus*: "Later I watched from a distance as he again approached the statue, attentively observed it, and simultaneously moved his hands and fingers as if speaking with someone."

Such direct "contact" must precede all appreciative esthetic contemplation of Greek work. In this sense Goethe was a Greek, since for the Greeks themselves, at least during their earliest period, works of art were part and parcel of the world. They identified with their images, whose reality — felt as an absolute reality — affirmed their own reality. Through images they consecrated themselves to the divinities in the sanctuaries, thus partaking of the realm of the gods. The heroes of myth were their progenitors, not simply mythological subjects like the *Perseus* of Canova or the *Jason* of Thorvaldsen. From earliest times until their golden age the Greeks preserved a belief in the mysterious interaction of persons and things, by which all that exists is bound together and interdependent in the world of existence. At the funeral banquet the deceased is present; a kouros on the grave or a stele with a figure in relief is the deceased himself. In their religious images the Greeks saw the divinity in his essence, and it is this identification which differentiates the Greek cult figures from those of the Christian west.

In view of this interweaving of reality and art, A. Stifter was justified in asking whether religion and art were not in the end one and the same for the Greeks. The essential character of Greek art was perhaps grasped most perceptively when K. Schefold entitled a study *Griechische Kunst als religiöses Phänomen* ("Greek Art as a Religious Phenomenon"; Hamburg, 1959), for the modern concept of art cannot be adequately applied to Greek sculpture. Herder, already aware of the equivocal nature of a concept of art, claimed that representation, as soon as it becomes art and is separated from the religious image, remains vital for only a short time; first it is "idolatry, then art, then craftmanship, and finally a thin soup of everything — pedantry, rubbish, and gossip." In a similar vein, Buschor began his study *Vom Sinn der griechischen Standbilder* with the phrase "Art has not always been art."

The above-mentioned modern sculptor Marcks adapted one of Goethe's opinions about the Greeks and maintained that the noble simplicity of conception, rather than the naturalness of execution, was the quality esteemed in the art of antiquity. He observed that the Greeks did not reproduce the so-called "natural" with the intent of deceiving but instead sought to understand and express nature. What makes Greek sculpture conform so closely to nature is "the intimate relationship between general and specific" (Stenzel) or, in Hegel's judgment, the "incorporation of a universal significance within the individuality of the figure, while at the same time the sensual form is elevated to a true expression of its spiritual significance." This was possible only because, for the Greeks, there existed no break between the physical and the spiritual. As Schiller stated in one of those felicitous appraisals of the Greek world, "at that time the realms of the senses and of the spirit were not so clearly divided." The standard education of Greek youth included training the body as well as the mind, and physical skill was meant to harmonize with spiritual development. Only then was it possible to express spiritual values in bodily guise. The overriding principle was harmony, a harmony that pervaded everything and excluded any dualism of the two elements — *Durchsein*, not *Gleichsam*, in Herder's words. As long as this harmony of the human being reigned, it was possible to express the spiritual essence of man in a corporeal figure, above all in sculpture. In each image the Greek represented himself, and sculpture was for him the most concrete expression of his own existence. In the estimation of Jean Paul, the Greeks "embody while we only represent or even abstract," or as described by Herder, with the Greek statue "we become one and it lives with our spirit."

Thus can the uniqueness of Greek sculpture be comprehended — unsurpassable to the extent that nothing else, although apparently similar, can be deemed sculpture in the same sense as the concept applies to Greek work. In a fundamental essay on sculpture, Herder has captured the basic sculptural value of Greek art "with marvelous surety and knowing intuition" (B. Schweitzer); while, in his masterful interpretation of Herder's essay, Schweitzer maintained that "the inherent possibilities of plastic representation have in no other field been realized with such purity as in Greek sculpture, which can stand simply as the ideal of sculpture." Further extending this appreciation, Hegel claimed that the Greek world could be understood only through the perspective of its sculpture. According to him, this feeling for perfect sculptural union of the divine and human was native above all to Greece. The spirit of Greece could not be grasped solely through her poets, orators, historians, and philosophers but ultimately required the key of insight into her sculptural ideal. The epic and dramatic heroes, as well as the real statesmen and philosophers, had to be seen from such a sculptural viewpoint. Greek sculpture has come to represent the "essential Greek" to such a degree that Jean Paul, for example, in his *Vorschule der Ästhetik* distinguished between Greek, sculptural poetry and modern, romantic or musical poetry. This dominantly sculptural conception of Greek art has been well expressed by the esthetician F. Hemsterhuis with apt antithesis, ". . . one can say that our modern sculptors are too much painters, just as the Greek painters were apparently too much sculptors." Enlarging upon this concept, A. W. Schlegel has noted that the spirit of all ancient art was plastic or sculptural, while that of the modern age is pictorial.

The ideas, intuitions, and judgments of philosophers, poets, and artists have in a sense comprehended and defined the essence of the Greek more clearly than has been accomplished by systematic archaeological investigation. As successors of Winckelmann, they quickly outdistanced his dogma of the imitation of antique works. It was their conviction that, although it is impossible to become Greeks again, a commendable perfection can still be attained by proceeding in the manner of the Greeks. By the beginning of our century the awesome remoteness of Greek figures had become ever clearer. For Hofmannsthal this was a terrifying discovery: "*Remotest* of the *remote* . . . but, my god, how real they are! They partake of things which are above any ordinary notions . . ." These words of Hofmannsthal cannot help but suggest the absolute reality of the *Seinsweld* that Buschor discovered in Goethe. Through such astute reactions to the hitherto remote ideals of Greek sculpture we have been able to establish a sympathetic and creative relationship with it, one in which subject and object seem interchangeable, as in Rilke's sonnet *Archaischer Torso Apollos*, where the statue, transformed into subject, is able to address the poet, who has become the object; like the oracle of Delphi the statue admonishes the poet that "you must change your life."

Max Wegner

**GREEK ART, AEGEAN.** The islands of the Aegean do not constitute a geographical entity: north to south, more than 370 miles separate Thasos from Crete; east to west, the distance from Rhodes to Melos is about 210 miles. From Rhodes and from Kos, the coasts of Lycia and Caria can be seen; from the Sporades, the coasts of Euboea and Thessaly; from Thasos, Samothrace, and Imbros, the coasts of Macedonia and Thrace. Lemnos is halfway between Mount Athos and the entrance to the Hellespont. The northern Cyclades (Andros, Tenos, Mykonos, Delos) mark out the route from Samos to Euboea and Attica; the southern Cyclades (Siphnos, Melos, Paros, Naxos, Thera), the route from Rhodes to Attica and the Peloponnesos. Crete, more isolated, serves to connect the eastern basin of the Mediterranean, the Peloponnesos, and Italy.

Situated as they are on the various routes of communication and commerce, in contact with the diverse civilizations of Thrace, Asia Minor, and the Near East, the Aegean Islands, from the beginning of the 1st millennium B.C. to the time of Alexander, produced works of art that, while unquestionably presenting common features, are also characterized by elements peculiar to each. In the present study of this artistic production, Crete is treated separately, and the other islands are dealt with in three divisions: the Dodecanese, the Cyclades and the Sporades, and the Thracian archipelago. Not included in this article are the islands close to the Greek mainland (Aegina and Euboea) and those close to the shores of Aeolis and Ionia (Lesbos, Chios, and Samos); these are treated together with the nearby mainland centers (see ATTIC AND BOEOTIAN ART; GREEK ART, EASTERN; PELOPONNESIAN ART).

Summary. Crete (col. 29): *Pottery; Metalwork; Ivories; Sculpture and sculptural decoration; Architecture; The Cretan tradition.* The Dodecanese (col. 35): *Pottery; Metalwork; Gems; Ivories; Sculpture;*

CRETE. *Pottery.* Cretan ceramic ware from the 10th to the 7th century B.C. follows the same artistic progression — proto-Geometric, Geometric, Orientalizing — that appears in the works of mainland and insular Greece; yet it has its own clearly defined characteristics. In Crete, as in Cyprus, the break between the sub-Mycenaean and the Geometric phase that is found in mainland and insular Greece does not occur. Vases continue to be produced until the mid-9th-century B.C. in traditional shapes — stirrup amphoras, bell craters, neck pithoi — directly derived from sub-Mycenaean pottery. But the technique clearly shows a decline: shapes and decorative motifs suffer a hardening. The various Cretan workshops existed in signal isolation; consequently the impoverished sub-Mycenaean style continued for a long time, with local variations, in many workshops in the central and the eastern parts of the island, which never progressed beyond the Geometric stage. On the other hand, in the ceramic workshops of Knossos a renascence is evident from the middle of the 9th century B.C. Toward the end of the proto-Geometric period there were importations of vases from Attica and the Cyclades; the adoption of motifs borrowed from the decorative repertory of these regions and of new forms, such as the amphora with vertical handles, demonstrates this influence. But it was with Cyprus that connections were more noticeably established. Cypriote vases were imported into Knossos in quantity, and the imitation of Cypriote forms in local pottery is obvious. The technique of red and black painting may also have been borrowed from Cyprus. However, the technique of painting in white on a black ground, used in a group of Geometric vases, is a Knossian innovation.

The Geometric style as it developed in north and central Crete (Knossos, Arkades), more clearly than its manifestations in other centers (e.g., Vrokastro, Kavousi), shows a refinement in relation to the proto-Geometric style. The clay is carefully cleaned, the varnish of better quality. The most characteristic new forms are the neckless ovoid pithos with narrow foot, two or four handles with metope decoration between them, and the lid commonly decorated at its center with an animal head in the round; the aryballos; and the oinochoe and lekythos of Cypriote type (PL. 3). The decoration has nothing in common with the Attic Geometric style; the Cretan Geometric style is already partially Orientalizing (PL. 2). That there was even in the last phase of the proto-Geometric style a sudden influx of Oriental motifs seems to be indicated by some vases found in the necropolis of Knossos. In these vases from Knossos the distinction between the Geometric and the Orientalizing style is in fact difficult and has to be somewhat arbitrary. In the second half of the 8th century B.C. and in the first decades of the 7th, Oriental motifs (palmettes, rosettes, braids, and interlaces) are more common than previously, but vase decoration has not undergone a radical change in so far as the composition of ornamental motifs, the disposition of zones and metopes, and techniques are concerned. Yet the Cretan taste for polychromy is more evident: the ovoid pithos on a tripod — a type probably derived from Cyprus — is painted in red and blue on a buff ground with yellow retouches and has incised decoration as well. Forms of Cypriote origin are still many. A dinos (deinos) from Arkades is the terra-cotta version of a basin of Oriental type (PL. 3), while several types of aryballos, skyphos, and oinochoe are related to proto-Corinthian vases.

Whether Cretan pottery influenced the pottery of other Greek centers, in particular that of Corinth and of Argos, has not yet been established. The export of Cretan vases was very limited (a small number have been discovered in Italy, notably in Gela, Sicily, which was founded by Rhodian and Cretan colonists at the beginning of the 7th century B.C.). Moreover, it was not long before Cretan ceramic art declined hopelessly; it remained halfway between a Geometric style like that of Athens and an Orientalizing style like that of Corinth. At the beginning of the 7th century B.C. some scenes with figures appear on Cretan vases, but one of the finest — one of the rare vases decorated in a style contemporaneous with the middle proto-Corinthian black-figured style — is also one of the last products of the workshops of Knossos: its technique and composition are Cretan, its form Cypriote, its style close to that of Corinth. The necropolises of Arkades and Praisos have yielded vases later than those found in Knossos; but the production of painted vases seems to end in all the workshops of Crete in the second half of the 7th century B.C. — unless certain of them continued until the next century to produce examples in the outmoded style.

*Metalwork.* Bronze objects have been found in appreciable numbers at all the important sites of Crete. Only a limited number of these were made by casting: one, an openwork stand from the Cave of Mount Ida, with small voluted columns, warriors, chariots, boats, and animals, was perhaps produced locally; others — for example, the tripods of Cypriote type from Vrokastro and Knossos and a pendant of Iranian type from Knossos — were imported. By far the greater number of the bronze objects are hammered and decorated in relief: cups, shields, belts, quivers, miters, and so forth. The cups belong to a group known through examples from Assyria, Phoenicia, Cyprus, Etruria, and the Greek mainland. It is probable that the Cretan examples, like those of Greece and Etruria, were imported from Syria and Phoenicia from the 9th to the 7th century B.C. The shields (PL. 1) and relief plaques pose a more complex problem. Most of the shields were found in the Cave of Mount Ida, but Palaikastro, Arkades, and Phaistos also yielded several; only two were found outside Crete, at Delphi and Dodona. Some have in the center, in high relief, the head of an animal, generally a lion. Typical decoration includes rosettes, pinwheels, human figures, palmettes, hunting scenes, confronted lions and sphinxes, and rows of deer, sphinxes, and bulls; other motifs are chariots, archers, a bearded man flanked by lions. A comparison with painted vases and terra-cotta figurines establishes that some of the shields are of local manufacture. But the majority are closely linked by motifs, composition, and style to the art of the Near East — Urartu, Syria, Assyria, Phoenicia. Imitation of foreign models by Cretan artisans is a possibility, but it may also be that these objects were imported or were produced by foreign artisans working in Crete between the end of the 9th century B.C. and the beginning of the 7th. This chronology seems to be confirmed by the circumstances of the discovery of a belt and a quiver at Knossos and of the Cretan shield at Delphi, by the date of the terra-cotta lids with an animal head imitating the bronze shields, and by comparison with the helmets, miters, and belts, which can be dated to the period from the second quarter of the 7th century to the beginning of the 6th. A dozen miters have been found in Crete (Dreros, Axos, Rhethymna), only two outside Crete (Delphi, Olympia). The example from Rhethymna is decorated with four human figures. Of the miters from Axos, one has a scene that has been variously interpreted — two lions flanking a tripod with a half figure above it; three others, decorated with the protome of Pegasos, are the latest of the series. Specifically Cretan is the helmet with each half of the crown decorated with a great embossed figure; three examples of the type have been found in Crete, a fourth in Delphi. The Delphi helmet, which is dated before the middle of the 7th century B.C., shows a figure of a woman on a bull. A helmet from Dreros is decorated with a panther; an example from Onythe shows a chariot, and one from Axos a Pegasos (I, PL. 438); these helmets are not earlier than the beginning of the 6th century. A gorgoneion from Dreros belongs to the same series. Cretan bronzesmiths also produced, in the 7th century B.C., figures cut out of sheet metal; one such plaque shows hunters carrying their prey (PL. 5).

The gold- and silverwork found in Crete, notably in the Cave of Mount Ida and in the tombs of Praisos and Knossos, though not extensive in quantity, is of fine quality. Pins, earrings, pendants, plaques cut out in the form of human or animal figures, funerary fillets — all are executed in the Orientalizing style and are related in their motifs and technique to the con-

temporaneous goldsmith's work of other Aegean islands (Rhodes, Cyclades) and of sites (Ephesos, Tralles) in Ionia and Lydia (PL. 16).

*Ivories.* The Cave of Mount Ida has also yielded fragments of ivory objects: two pierced relief plaques (one representing a deer, the other a sphinx), a spoon with handle in the form

Chief centers of Greek art in the Aegean (inset A: Crete). *Key:* (1) Cave of Mount Ida.

of a female figure with outstretched arms, a head of a bull, bases for statuettes. None of these ivories is of Cretan workmanship. They are identical with examples found in a number of sites in the Near East, including Nimrud, Arslan Tash, and Samaria. The Mount Ida ivories were, like the bronze cups described above, imported to Crete from Syria and Phoenicia in the 9th and 8th centuries B.C.

*Sculpture and sculptural decoration.* The terra-cotta sculpture of Crete is well documented: there are many reliefs and figurines, some attached to vases. In Crete as in other parts of the Greek world — Rhodes, the Cyclades, Boeotia, probably the Peloponnesos — pithoi with relief decoration were produced in the 8th and 7th and part of the 6th centuries B.C. The decoration, arranged in friezes and panels on the neck and body of the vases, comprises Geometric and Orientalizing elements and shows animals and monsters, in particular the horse and the sphinx. Decoration in the round, besides appearing on the lids of painted pithoi and on a dinos from Arkades (PL. 3), is found on other vases: there is a series of jars with spouts on the shoulder in the form of animal heads. The Cretan workshops also produced whole vases in the shape of animals (owl, bull, lion); of especial interest is a series of askoi in the form of ducks, patterned after a type widely diffused in Cyprus. Found in eastern Crete (Praisos, Lato, Anavlochos) and at Gortyna were numerous square plaques of terra cotta, with a suspension hole, decorated in relief with motifs of Oriental derivation: sphinx or griffin passant, horses, sphinx, confronted griffins on either side of a Potnia Theron ("Lady of the Beasts") or a winged deity (PL. 5). Other plaques, rectangular in shape, bear female figures, full face or profile, often wearing the high polos on their heads. Several mythological scenes appear: Bellerophon mounted on Pegasos, alone or battling the Chimaera; the murder of Agamemnon by Klytemnestra and Aigisthos. A plaque from Tarentum representing Theseus and Ariadne (?) was probably made from a Cretan mold. Some of the plaques are cut out and adorned with openwork. Most of these terra-cotta reliefs date from the 7th century B.C.

In the Geometric period Cretan sculpture was certainly not comparable to the sculpture of mainland Greece. In the 7th century B.C., however, there was an increase in production and an improvement in quality, especially marked toward the middle of the century, when the use of molds became general. The Cretans were among the first in the Greek world to accept the use of molds, which had been known for a long time in the Near East and which were introduced into Cyprus in the 8th century B.C. The greater number of the figurines, modest ex-votos of medium quality, are only about 4 to 8 in. high, but some of them, judging from extant heads, must have measured about 15 to 20 in. That it is style as much as size which lends monumentality to sculpture is proved by two statuettes from Gortyna: the bust of a nude goddess, dating from shortly before the middle of the 7th century, and an early-7th-century Palladion (PL. 4). A terracotta bust from Praisos showing strong Cypriote influence belonged to a statue about 4 ft. in height; it does not seem to be earlier than the first half of the 6th century B.C.

The discovery of these large terra-cotta statuettes brings another argument to bear in favor of the hypothesis attributing to Cretan workshops several bronze statuettes of unknown provenance found outside the island. Two of these, a solid bronze head in Klagenfurt and a hollow-cast one in Karlsruhe (PL. 4), belonged to statues about 12 and 20 in. high, respectively. Thus the Cretans must have known and practiced at least as early as the middle of the 7th century B.C. the technique of hollow casting — a method in which they were anticipated among the Greeks only by the Samians. (The head in Karlsruhe has in fact been attributed to a Samian workshop.) The Cretans also practiced a sculptural technique of applying hammered metal plates to a wooden core (*sphyrelaton*): a group of three statuettes — a god $27^1/_2$ in. high and two goddesses about 16 in. high, made of hammered bronze sheets fastened to a wooden core — was found in a small temple in Dreros. Two bronze statuettes in Berlin, a kouros from the middle of the 7th century or slightly later found in Delphi and a kriophoros of unknown provenance from the end of the 7th century or the beginning of the 6th, are generally held to be Cretan works. An ivory group of the late 7th century B.C. in New York (Met. Mus.) is attributed to a Cretan artist. It presents two female figures tentatively identified as Aphrodite and Peitho or Demeter and Kore (I, PL. 341).

In addition to making wooden sculptures of the gods, such as the representations of Athena and Britomartis that were still to be seen in Knossos and Olynthos in the time of Pausanias, the Cretans worked in stone from the 7th century B.C. on. The "Lady of Auxerre," a work of unknown provenance dated a little after the middle of the 7th century, is very probably Cretan (I, PL. 342). The lower part of a statuette of the same type and dimensions but of somewhat earlier date has been found in Gortyna, also the source of the upper part of a larger than life-size statue, the face mutilated. Of another type, the seated goddess, there are several examples: a statuette found at Malla, slightly under 20 in. high, dating from the first half of the 7th century; a life-size statue from the middle of the 7th century, of which only the lower part remains; a bust from Eleutherna (PL. 4), dated 630–620; and, probably, a statuette (provenance

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

unknown) in the Louvre. The cubic style of these works suggests that the artists drew their inspiration from Syrian and "neo-Hittite" statues.

The "Lady of Auxerre" and the bust from Eleutherna, the terra-cotta statuettes from Gortyna, and the other figurines demonstrate the importance of the role that Crete played in the development of the so-called "Daedalic" style. Also in this style are the nude deities in high relief, combined in groups of two or perhaps three, the remains of which were found at Gortyna. The style persisted in Crete almost until the mid-6th century B.C. (when it was already outdated in other Greek regions), as is shown by a head found at Axos. One of the two earliest known examples of architectural sculpture in stone (the other being a relief from Mycenae) comes from Temple A at Prinias: a lintel(?) bearing two seated goddesses, the front decorated with reliefs of lions and stags (PL. 1), the underside with elongated female figures. The seated goddesses and the reliefs seem no earlier than the last quarter of the 7th century B.C., whereas the frieze of riders in stone that belongs to the same building seems to date from the middle of the century (I, PL. 342). The earliest known example of terra-cotta architectural decoration is a frieze from Palaikastro; it represents warriors departing in a chariot, with a dog leaping alongside, a motif found later in the friezes of Thasos and of Larisa on the Hermos River.

*Architecture.* Little is known about the structures to which the above-mentioned friezes in stone and terra cotta belonged, but an idea can be formed of the ground plans of a few archaic temples. In Dreros a temple going back to the 8th century B.C. was in the form of a rectangular room with a bench at the back; it had an interior altar between two columns placed along the axis of the entrance. The ground plan of Temple A at Prinias, which included a porch supported in the center by a pier, and of the Pythion of Gortyna, remodeled in Hellenistic and Roman times, were the same in their main outlines. This type of structure is known, with variations, from Sicily to Asia Minor. An archaic temple at Gortyna was divided into three cellae opening on an atrium; the same plan, but with two cellae, is found in the Temple of Ares and Aphrodite near Lato, which was reconstructed in Hellenistic times on the plan of the archaic building. It is more plausible to connect the erection of buildings open on the long side and divided into two or three cellae with an Oriental fashion that lasted as late as the Roman period, for example, in Cyprus and Palmyra, than with Minoan survivals. In this custom of associating several divinities in one temple is perhaps to be found the explanation for the grouping of divinities in twos and threes so typical of Cretan art of the 7th century B.C.

The active political life that had developed in the Cretan cities in the 7th century is reflected in the literary tradition, which has it that the great legislators of the archaic period were from Crete. It is in Crete, especially at Dreros, Lato, and Gortyna, that the earliest remains of agorai and public buildings have been found.

Only a few architectural elements of the archaic period have been discovered on the island. A palm-leaf capital with abacus originally independent of it (PL. 5) is the precursor of one used in Delphi in an Ionic monument of the second half of the 6th century B.C. Some fragments of volutes found in Prinias may come from Aeolic, or proto-Ionic, capitals. No Doric capitals of the 7th century comparable to those in Delphi or the Peloponnesos have yet been found in Crete. The stone and terra-cotta friezes of Prinias and Palaikastro, antedating the earliest ones known in Ionia, are continuous bands of an Oriental, not a Greek mainland, type. Conclusions drawn from evidence so fragmentary must be very tentative, for they could be upset at any time by new findings; the most that can be said concerning architecture during the 8th and 7th centuries B.C. is that Crete felt the Oriental more strongly than the mainland Greek influence. This being so, it appears less strange that two Knossian architects, Chersiphron and his son Metagenes, were called to Ephesos to construct the Artemision that preceded the temple erected by Croesus.

*The Cretan tradition.* Literary sources would afford proof of the renown of Cretan artists if one could be certain that there were no confusion of Minoan with archaic Crete. From Homer to Plato and Pausanias, Daidalos has symbolized the artist par excellence, at once sculptor, architect, and goldsmith; he lived and worked in Knossos (under Minos), Athens, and Sicily. His renown was such that all the xoana of archaic type were attributed to him. According to Pausanias, Dipoinos and Skyllis, both of Gortyna, were sons of Daidalos. They were assumed to have worked in wood, marble, and ivory, chiefly for the cities of the Peloponnesos. Among their disciples, in the 6th century, were cited Tektaios and Angelion, makers of a colossal statue of Apollo in Delos, and three Spartans whose works were seen in Olympia — Hegylos, Dontas, and Dorykleidas. Cheirisophos, who erected a gilded xoanon of Apollo at Tegea, was a Cretan. According to Pindar, the earliest statue of Apollo, that in Delphi, came from Crete.

From the 6th century on, however, Cretan art no longer existed as a creative and original force. Of course, this does not mean that from the 6th to the 4th century B.C. there was a complete cessation in Crete of the production of ex-votos and the construction of buildings. It is true that this period has been neglected in favor of the Minoan and archaic periods; yet, with the exception of Gortyna and perhaps Knossos, no Cretan city erected buildings comparable with those of the rest of the Greek world. No art center of importance existed in Crete during the classic period; the Cretan artists whose names are known worked in mainland Greece.

The coins of Crete give further evidence of the isolation and the economic and artistic impoverishment of the island. Cretan coins do not begin to appear until the 5th century B.C., and many of them are marked by a poverty of workmanship that has no parallel in the Greek world. Types from Aegina, Arcadia, and Argos were imitated; foreign coins — for example, those of Cyrene, Argos, Aegina, and Euboea — and even some of other Cretan cities were restruck. Cretan myths are illustrated on the coins of Knossos (the Minotaur in the Labyrinth) and of Gortyna (Europa and the Bull; PL. 16); they are rendered in an archaic style recalling the embossed figure on the helmet from Delphi. The most beautiful of the Cretan coins are from the 4th century B.C. Two engravers signed their pieces — Neuantos at Kydonia and Pythodoros at Aptera and Polyrrhenia — but whether they were Cretans is not known.

ARTISTS BORN OR ACTIVE IN CRETE. *a. Architects.* Daidalos, see below. – Chersiphron (Χερσίφρων) and his son Metagenes (Μεταγένης), of Knossos, worked ca. mid-6th cent. B.C. on the Artemision of Ephesos; may have written works on building technique (E. Fabricius, RE, s.v. Metagenes; S. Marinatos, Ἐπὶ τὰ ἴχνη τοῦ Χερσίφρονος καὶ Μεταγένους ἐν Ἀμνισῷ, Κρητικά Χρονικά, VII, 1953, p. 258 ff.; A. W. Lawrence, Greek Architecture, Harmondsworth, 1957, p. 132).

*b. Sculptors.* Daidalos (Δαίδαλος), legendary figure — sculptor, architect, and goldsmith — son of Eupalamos or Metion; of Attic origin but believed to have been active in Crete 7th cent. B.C.; worked first in Athens, then in Crete, whence he fled, according to traditional lore, to Sicily, Cumae, Sardinia, and Africa; teacher of Dipoinos, Skyllis, and Endoios; believed to have been responsible for the earliest advances of Greek art: (1) sculptures in wood: Herakles, in Thebes, Corinth, Pisa, and at the border between Messenia and Arcadia; Hermes, in the Erechtheion of Athens; Trophonios, at Lebadeia; Britomartis (a xoanon), at Olynthos, probably reproduced on Cretan coins; Athena, at Knossos; Aphrodite (terminating with a pilaster), in Delos; statues in the Heraion of Argos, in Crete, at Gela, in the Elektrides, or Amber Islands, at the mouth of the Po, and for an altar identified only as dedicated to Poseidon; cow; (2) sculptures in stone: Artemis Monogisene, in Caria; crater with gigantomachy and Kronos, for Kokalos; choros (?); altar at Solossa, in Libya, probably a Carthaginian work; at Halikarnassos a base bearing his name, probably for a copy of a work by him or by Daidalos of Sikyon; (3) architecture: choros for Ariadne, at Knossos (a work whose type is contested); the Labyrinth for the Minotaur at Knossos, also identified with the palace; Temple of Britomartis at Olynthos; propylon of the Temple of Hephaistos in Memphis; *kolymbethra* (?; swimming pool) of the Alabon near Megara Hyblaia; baths near Selinous (probably thermal); wall of Kamikos near Akragas (mod. Agrigento); widening of the court of the Temple of Aphrodite at Eryx; temples of Apollo at

Cumae and at Capua; *daidaleia* (nuraghi) in Sardinia; (4) other works: folding chariot seat (*diphros*) for the Temple of Athena Polias on the Acropolis of Athens; golden honeycomb in the Temple of Aphrodite at Eryx (W. Amelung and H. Thiersch, ThB, s.v.; Lippold, GP, p. 18 ff.; E. Homann-Wedeking, 1950, p. 42 ff.; G. Becatti, RM, LX–LXI, 1953–54, p. 22 ff.; M. Cagiano de Azevedo, Saggio sul Labirinto, Milan, 1958). – Dipoinos (Δίποινος) and his brother Skyllis (Σκύλλις), according to tradition from Gortyna, pupils or sons of Daidalos, probably active 7th cent.; credited with introducing the use of marble: Herakles in gilt bronze, at Sardis; Apollo, Artemis, Herakles, and Athena, at Sikyon (struggle for the Delphic? tripod; the Herakles and Athena can perhaps be identified with the two following works); Herakles, at Tiryns; Athena, at Kleonai; the Dioskouroi and their descendants, in ebony and ivory, at Argos; Athena, at Lindos; one or more statues of unidentified subjects at Ambrakia (Lippold, GP, p. 23; E. Homann-Wedeking, 1950, p. 46 ff.). – Cheirisophos (Χειρίσοφος) of Crete, worked in the Daidalic tradition, active 6th cent. in the Peloponnesos: gilt xoanon of Apollo, in the Temple of Apollo at Tegea and a portrait in stone next to it, probably of the sculptor (Lippold, GP, p. 23 ff.). – Athenis and Boupalos (Ἄθηνις, Βούπαλος) of Chios, second half 6th cent.: Artemis, at Lasos (or at Iasos, in Caria?); for other works see GREEK ART, EASTERN. – Aristokles (Ἀριστοκλῆς) of Kydonia, active end of 6th–first half of 5th cent.: Herakles and the Queen of the Amazons, of which perhaps an inscription fragment was found in Olympia (Lippold, GP, p. 98; M. T. Amorelli, EAA, s.v.). – Akestor (Ἀκέστωρ) of Knossos, first half of 5th cent. if he is to be identified as the father of Amphion, end of 4th cent. if he is to be identified with Akestor of Argos: bronze statue of Alexibios, at Olympia (W. Amelung, ThB, s.v.; L. Moretti, EAA, s.v.). – Amphion (Ἀμφίων) of Knossos, son of Akestor, pupil of Ptolichos and teacher of Pison of Kalaureia, ca. mid-5th cent.: votive gift from Cyrene, at Delphi (Lippold, GP, p. 176; M. T. Amorelli, EAA, s.v.) – Kresilas (Κρησίλας) of Kydonia, active in Athens, second half of 5th cent. (see ATTIC AND BOEOTIAN ART). – Damokrates (Δαμοκράτης) of Itanos, period uncertain, known only from an inscription (W. Amelung, ThB, s.v., n. 3).

*c. Engravers of coins.* Neuantos (Νεύαντος), active at Kydonia 4th cent. B.C.: didrachma, signed, with the head of a maenad on the obverse and Kydon with bow on the reverse; attributed: didrachma, similar to the preceding one (BMC, Creta, p. 28, ill. VII, 1; K. Regling, RE, s.v.). – Pythodoros (Πυθοδῶρος), second half of 4th cent., active at Aptera and Polyrrhenia: didrachma of Aptera, with Artemis on the obverse, warrior on the reverse; half drachma of Polyrrhenia with Artemis on the obverse and bull's head on the reverse; attributed: didrachma of Aptera and half drachma of Polyrrhenia, similar to the preceding ones (K. Regling, ThB, s.v.).

THE DODECANESE. *Pottery.* Although the Mycenaean civilization had been deeply rooted in the Dodecanese, more deeply even than in Cyprus, it is problematic whether anything remained of these traditions two centuries after the fall of the Achaean empire. The proto-Geometric style is little known in its Rhodian aspect. But in Kos, where tombs from the beginning of the 1st millennium B.C. have been explored, one tomb — the earliest — was found to contain both a Mycenaean vase and some proto-Geometric vases altogether different from it in type and style. Thus the break with Mycenaean forms and decoration appears here much more clearly than in Crete.

The Attic influence is plain. The proto-Geometric style must have been introduced into Kos at a very early time, when the light-background style was still used in Attica — probably by immigrants coming from Attica itself or from Argolis, because all the vases found in Kos are of local manufacture. The most common forms are the oinochoe with trefoil mouth, the skyphos, and the cup with conical foot. The proto-Geometric style seems to have disappeared here at the same time as in Africa, or a little later, giving way to the Geometric style in the first half of the 9th century B.C.

In contrast to the development in Crete, a pure Geometric style is seen in the Dodecanese; it is represented in Kos and Rhodes by amphoras, cups, oinochoai, and craters decorated with meanders, triangles, and hatched lozenges. The decoration, limited at first to the shoulder of the vase, was later extended to cover the whole body, frequently being divided into a series of panels. The human figure does not appear, and animals are rare; birds, placed singly or in rows, predominate. The Rhodian Geometric style has features in common with the Attic, but which one influenced the other is difficult to establish. In the 8th century B.C., the pottery workshops of Rhodes seem to have set the style for those of Chios, Samos, and the cities of the Ionian coast. Cypriote pottery appears to have been widely imported and imitated in Rhodes, as in Crete, but the Rhodian production is remarkably resistant to infiltrations of Oriental elements, compared with the Cretan ceramics of the 8th century: all that can be pointed to in the advanced phase of the Rhodian Geometric style is the use of pinwheel and palmiform ornament.

The sub-Geometric style in Rhodian pottery persisted for a long time (PL. 6). Particularly characteristic is the skyphos decorated with the motif of a bird in a metope framed by geometric ornament; vases of this type were produced until late in the 7th century B.C. Isolated Oriental motifs crept in little by little. Thus in the first half of the 7th century sphinxes and griffins, lions and panthers, dogs and hares, and, above all, deer and wild goats appear on the shoulders of vases — of oinochoai in particular — conforming in composition and linear decoration to the Geometric tradition. A small group of vases of this period is marked by Cypriote influence. An oinochoe with its upper part sculptured in the form of a griffin's head is perhaps related to this half-Geometric, half-Orientalizing Rhodian style; it has no exact parallel in Greek pottery and is most often attributed to a Cycladic workshop (PL. 9). The so-called "Vroulia cups," of metal-like aspect, combine sub-Geometric decorative elements and Oriental motifs until the 6th century B.C. (PL. 6).

It is often difficult to distinguish the Geometric and sub-Geometric wares of Rhodes from those of the Ionian Islands and cities or of the Cyclades; a kind of artistic koine linking Dorian Rhodes with its Ionian neighbors was established very early. But even if Rhodes was not the birthplace of all the vases attributed to the east Greek centers, it contributed greatly to the diffusion of these wares toward Cilicia and Phoenicia as well as the distant Italian shores. The Greek vases found at Mersin, Tarsus, Al Mina, and other places in the Near East originated for the most part — for the period from the end of the 9th to the beginning of the 6th century B.C. — in Ionian and insular workshops, Crete excepted; at least some of these vases were manufactured in Rhodes. One of the earliest Greek inscriptions known, an epigram mentioning the "Cup of Nestor" (IV, PL. 73), is scratched on a Geometric vase of Cycladic or Rhodian origin from the necropolis of Pithekoussai (Ischia).

Not until about the middle of the 7th century B.C. did an Orientalizing style come to full bloom in east Greek pottery — the style variously termed "Rhodian-Milesian," "wild-goat," and "Kameiros." Ephesos, Miletos, Samos, Chios, and Nisyros are among the possible, or probable, centers of production. But a great number of the vases, very likely even the majority, were produced in Rhodes. The style is distinct in technique, vase forms, decorative repertory, and composition. The decoration is painted in black outline, with some parts in hatching, against a light buff background. Besides craters and dinoi, the preferred form is the oinochoe with trefoil mouth. The linear motifs include pinwheels on the neck of the vase, and triangles, rosettes, half circles, and meanders within squares in the main zones; a frieze of flowers or lotus buds often adorns the lower part. The human figure does not appear, but there is a great variety of animals, most numerous among them deer and wild goats, generally in continuous friezes, one above another for almost the entire height of the vase (III, PL. 132). This scheme contrasts with the division into metopes favored in the sub-Geometric style and recalls the decoration of textiles and goldsmith's work. The Greeks of Rhodes and Ionia derived their formula not so much from Syria or Mesopotamia, whence the proto-Corinthian and Corinthian styles drew their inspiration, as from Anatolia — perhaps from Phrygian and Urartian art, which, traditionally Mesopotamian, had been infused with new life by the contribution of Cimmerian and Scythian nomads.

Along with vases in the Kameiros style, the Rhodian workshops produced an original series of plates with the tondo divided into two unequal sections; the upper, and larger, part is generally filled by an animal or monster — Chimaera, sphinx, bull, ram, dog, or other. The Euphorbos plate in this series

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

(I, PL. 335) is one of the rare works of pottery of east Greece showing a mythological or epic scene.

The Kameiros style reached its peak in the second half of the 7th century B.C., falling under the influence of Corinthian pottery toward the end of the century; production continued until the middle of the 6th century, though in the second quarter of the century this style began to give way to the so-called "Fikellura style." Vases in the new style were produced in Rhodes and probably at the same time in Samos; in technique (buff slip, outline drawing, hatching) and in decorative scheme (pinwheels, friezes of flowers, lotus buds) they are directly connected with the Rhodian Orientalizing style (PL. 6). In the first phase, oinochoai and cups are numerous, but the commonest form over the entire duration of the style is the amphora. Animals or human figures, individually or in friezes, comprise the main decoration on the shoulders and the body. The Fikellura vases were found for the most part in Rhodes, Samos, on the coast of the Black Sea, and Egypt; some examples came to light in Cyprus, the Cyclades, Aegina, Attica, Corinth, Delphi, and the western Mediterranean (Sicily, Magna Graecia). The production of painted vases in Rhodes ceased about the end of the 6th century B.C.

The Rhodian tradition is continued by the so-called "Klazomenai sarcophagi," the latest examples bringing it to the middle of the 5th century B.C. Some of these were found in Rhodes and could be of local manufacture, but the type belongs to the artistic koine of the southwestern part of Asia Minor, and in view of their distribution there can be little doubt that the greater number of the sarcophagi originated in Ionia. Large pithoi with reliefs were produced in Rhodes during the 7th and part of the 6th century B.C. Later, on the whole, than the Cretan examples, they differ from them in decorative technique: generally the designs were imprinted with a patterned cylinder. The motifs most frequently seen are spirals, zigzags, and meanders. Human figures and animals are rare: chariots, several sphinxes, centaurs, horses, and goats are seen.

One of the main Rhodian industries was the making of terra-cotta sculpture in the round; this industry was active uninterruptedly from the 7th to the 4th century B.C., producing quantities of statuettes and plastic vases (that is, vases made in the shape of a human figure, animal, or other natural object). In the 7th century Rhodian sculpture went through the same phases of the Daedalic style as can be seen in Crete and Laconia. The small female figures in plaquette form show Oriental features. Also, in this period a great many Cypriote terra cottas were imported into Rhodes. The production of plastic vases in the Dodecanese goes back to a very early date. A tomb in Kos contained, among the more conventional Geometric vases, plastic vases decorated in that style. Rhodes and Ionia were the principal sources of this ware throughout the Greek world from the end of the 7th through the 6th century B.C., surpassing Corinth in the number and variety of types produced. The painted decoration connects these vases with the pottery of the late Kameiros style and the Fikellura style. The main types are the standing, kneeling, or seated female figure, the bust of a female figure, the Seilenos, the helmeted warrior head, Gorgon head, and the head of the river god Acheloos; heads of (or entire) ducks, eagles, rams, horses, lions, hares, and apes are also common.

In the course of the second half of the 7th century, to the Cypriote influence on Rhodes was added the Phoenician-Egyptian, either directly or by way of Cyprus or Naukratis. This is evidenced chiefly by the appearance of faïence vases in the form of animals and various personages. These vases, which Rhodes was instrumental in distributing to Mediterranean markets, were at least in part made on the island, along with the plastic vases of painted terra cotta. The workshops producing the faïence vases may have been established by Egyptians or, more probably, Phoenicians. This may apply also to the origin of the alabastra in the form of human heads, the ostrich eggs with painted or scratched ornament, and the engraved shells; these objects, which spread from Mesopotamia to Etruria and even Spain, were found in quantity in Rhodes, especially at Lindos.

In the second half of the 6th century B.C. the workshops of Rhodes (and probably in part also those of Ionia) produced not only plastic vases but, in even greater number, terra-cotta statuettes. The same molds served for both, the two categories having in common the representation of various figure types: standing woman holding a dove, seated woman, standing man, reclining man, man and woman seated side by side. The technique of the hollow figurine must have developed in Rhodes out of the plastic vase technique; it then spread over the entire Greek world. Rhodian terra cottas were exported in quantity — to Syria, Phoenicia, Etruria, and, above all, Magna Graecia and Sicily, where they were imitated, especially at Selinous.

The western markets were shut off in the period of the Persian Wars, but the workshops of the Rhodian coroplasts continued active, producing not only plastic vases but figurines and masks, which continued to be exported to Attica, Boeotia, the Cyclades, Olynthos, and Cyrenaica and were imitated in several of these regions. That this production had not yet ceased in the 4th century B.C. is shown by the finds at Lindos.

*Metalwork.* The testimony of the painted vases, plastic vases, and terra-cotta figurines is that Rhodian trade in the western Mediterranean was at its height from the mid-7th to the mid-6th century B.C. The discovery in the Mediterranean region and in western Europe of bronze utensils of this period probably manufactured in Rhodes confirms this. Bronze objects found in Rhodes itself, however, are not numerous; they go back mainly to the 8th century B.C. and the first half of the 7th: pendants and animals, handles of bowls, and so on. As for the Orientalizing period, the Tyszkiewicz plate (incised protomas of griffins and animal frieze), found in Etruria and often attributed to a Rhodian workshop, has also been claimed for Corinth. But another plate with incised decoration, also of Etrurian provenance (PL. 7), and a series of oinochoai having handles decorated with palmettes, rosettes, and lotus flowers in relief resemble the vases in the Kameiros style so closely that a Rhodian origin is highly probable. The oinochoai were found in Sidon, Sicily, Etruria, and the valleys of the Rhone and the Rhine; they were imitated in Italy and Carthage.

In the absence of bronzes, lost through their vulnerability to oxidation, the mastery in metalwork of the Rhodian workshops in the hundred years, roughly, from the first half of the 7th to the first half of the 6th century B.C. is attested by the objects of silver, electrum, and gold found in Rhodes, particularly at Kameiros. A silver kantharos in the Louvre is worked in the same technique and decorated in the same style as the bronze oinochoai. In the tombs were discovered, besides funerary gold fillets, a great number of rectangular plaques in gold and in electrum, more rarely in silver, each with a decorative figure — centaur, sphinx, bee with human head, Potnia Theron ("Lady of the Beasts"; PL. 16). The earliest, perhaps antedating the middle of the 7th century, are done in a simple embossed technique; in the second half of the century the surfaces of plaques and figures are covered by rich decoration in filigree and granulation. These plaques were joined in various combinations to form necklaces or diadems. Some of the later ones were inserted into an ensemble of rosettes and small chains and worn hanging from the ears or at the temples. Heads of griffins and the like, sometimes placed in the corners of such plaques, establish a relation between these pendants and a group of works apparently produced chiefly in Melos (PL. 16). If the generally proposed dates for the earliest Rhodian gold plaques and the earliest vases in the Kameiros style are correct, it follows that a repertory of Oriental motifs was used by the goldsmiths of Rhodes a quarter century before it was adopted by the potters.

*Gems.* In several branches of art Rhodian production is fused with that of other regions of the eastern basin of the Mediterranean. A type of scaraboid of the 8th century, decorated either with a lyre player (VI, PL. 34) or with a man and a big fish or with a deer, is represented by numerous examples from an area comprehending Rhodes, Chios, Cilicia, Cyprus, and Phoenicia and by sporadic finds in Crete, in the Cyclades, and on the Greek mainland. For at least some of these objects, Rhodes was probably the place of origin. The gems of the 7th and 6th

centuries B.C. may include some of Rhodian origin, but evidence is still lacking.

*Ivories.* The ivories found in Rhodes are rather few in number; there are some plaquettes in relief representing a nude goddess and the head of a woman (Kameiros), religious scenes (Lindos), a siren, a deer, and birds (Ialysos), and there are statuettes in the round and spoons with handles in the form of a swan's neck or a female figure (Lindos). All these objects were either imported from the Syro-Phoenician area or are direct imitations of prototypes from that region.

*Sculpture.* Apparently sculpture did not flourish in Rhodes at a very early date. Three stone statuettes of female figures of the 7th century B.C. served as supports for a *perirrhanterion* (lustral basin) of a type known from an example in terra cotta found in Rhodes itself and from others in stone found in Athens, Delphi, and Olympia and at the Isthmian sanctuary near Cor-

Plan of the acropolis of Lindos, Rhodes. Monuments later than the Greco-Roman period are indicated by dotted lines. Buildings: (*a*) Temple of Athena Lindia, 4th cent. B.C., erected over an archaic temple; (*b*) propylaia, 4th cent. B.C.; (*c*) stoa, early 2d cent. B.C.; (*d*) late Roman temple, ca. A.D. 300; (*e*) exedra with statue base, Hellenistic period (after *E. Kirsten and W. Kraiker, Griechenlandkunde, Heidelberg, 1956, fig. 98*).

inth. The sculptures of the 6th century on the island of Rhodes are few, and it is not certain whether they are all of local origin. Two headless statues of kouroi found at Kameiros were probably imported from the Cyclades. An archaic marble head of Ionian style (Istanbul, Archaeol. Mus.) is said to have been found at Rhodes (I, PL. 357). There is another head from Kameiros that could have been made on the island, and the same is true of an archaic relief from Kos. The rarity of these finds — if it is not attributable simply to the fortunes of excavation — is as much due to the preference for decorative arts on the part of the Rhodians as to the lack of marble on the island. Very few statues figure among the archaic ex-votos of the Temple of Athena at Lindos, which are catalogued in the "chronicle of the temple" (engraved, to be sure, more than two centuries after their disappearance). The situation for the 5th century is no different. The few funerary steles must have been made locally; they are products of the Ionian koine, marked by no real originality. The most beautiful of them, the stele of Krito and Timarista (PL. 8), dating from the last third of the 5th century B.C., bears witness to the influence of Attic art of the time on the Cycladic and Ionian styles.

*Architecture.* On the sites of the Rhodian cities few traces remain to indicate the prosperity they enjoyed during the 7th and 6th centuries B.C. Everywhere — on the rock of Lindos, on the acropolis of Ialysos, on the slope at the site of Kameiros — later construction has destroyed almost all vestiges of the period. The same is true of the city and the Asklepieion of Kos. (An exception is the great water reservoir in Kameiros, filled in at the time the portico dominating the city was built.)

New life manifested itself in all areas after the difficult period of domination by Persia and the Athenian League. In 408 the city of Rhodes was founded: little remains of the earliest monuments of the new city. It was in the 4th century that the propylaia were built on the acropolis of Lindos (FIG. 39), on the plan of the Propylaia of the Acropolis of Athens, and the Temple of Athena was reconstructed at this time. A fountain house at Ialysos goes back to the same period.

*Coins.* Even if the buildings have disappeared, there remain the coins — along with the objects of metal, terra cotta, and faïence — to testify to the commercial activity of these cities. Early in the 6th century B.C., coins of silver and electrum were struck by Poseideion (Karpathos), Kos, Kameiros, and Lindos; the first coins of Ialysos seem to be later. After 408–407, the coins common to the island cities bear the head of Helios on the obverse and a rose on the reverse. The gold staters of this type, from the 4th century B.C., are among the earliest gold coins minted by any Greek city (PL. 16).

*Later development.* In Hellenistic times, particularly in the 3d century B.C. and in the first third of the 2d, Rhodes enjoyed great prosperity and even became an important center for sculpture. Some indications of this evolution can be discerned from the end of the 5th century B.C. on. The Rhodians began to show an appreciation of great art that they seem to have lacked in the archaic period. Celebrated artists such as Parrhasios, Praxiteles, Apelles, Lysippos (qq.v.), and Bryaxis received commissions from Rhodes and Kos. In the 4th century B.C. local sculpture production was of routine quality, but certain artists of Rhodes, such as Symenos and Aristonidas, merit notice.

ARTISTS BORN OR ACTIVE IN RHODES. *a. Architects.* Deinokrates (Δεινοκράτης) of Rhodes or Macedonia, referred to also as Deinochares, Timochares, Hermokrates, Cheirokrates (identical with the architect of the second Artemision of Ephesos?); active for Alexander the Great: plan for the foundation of Alexandria; project of transforming Mt. Athos into a colossal statue; altar for the Hephaisteion in Babylon (H. Thiersch, ThB, s.v.).

*b. Sculptors.* Dipoinos and Skyllis, probably of Gortyna (see above under Crete). – Lysippos (q.v.) – Symenos (Σύμενος), probably of Rhodes, identified with the son of Damostratos; active ca. mid-4th cent. B.C. (formerly considered Hellenistic), probably collaborated with Demetrios of Alopeke: two signed bases from the Acropolis of Athens and one from Lindos; athletes, warriors, hunters, offerers (Lippold, GP, p. 260; Picard, III, pp. 144, 212). – Ephedros (Ἔφεδρος) of Athens, mid-4th cent.: signed base from Lindos (Lippold, GP, p. 244). – Bryaxis (Βρύαξις) of Athens, second half of 4th cent.: five colossal statues of divinities in Rhodes (see ATTIC AND BOEOTIAN ART). – Aristonidas (Ἀριστωνίδας), bronzeworker and painter of Rhodes, son of Mnasitimos, active ca. 350–330 B.C.: two signed bases, one found at Lindos and one near Rhodes (Lippold, GP, p. 287; G. Pugliese Carratelli, ASAtene, XXX–XXXII, 1952–54, p. 262, n. 7; A. Di Vita, EAA, s.v.). – Teisagoras (Τεισαγόρας), probably of Rhodes, assigned by most scholars to the Hellenistic (see HELLENISTIC ART) but by some to the archaic period (Picard, I, p. 172). – Aischines (Αἰσχίνης) of Rhodes, chronology and activity unknown (W. Amelung, ThB, s.v.; G. Cressedi, EAA, s.v.).

*c. Painters.* Parrhasios (q.v.). – Apelles (q.v.). – Protogenes (Προτογένης) of Kaunos, in Caria, or Xanthos, in Lycia; second half of 4th cent. B.C.: Ialysos as a hunter, the satyr Anapayomenos (304 B.C.), both works later taken to Rome; Kydippe and Tlepolemos, heroes of the Rhodian cycle, in an undetermined place (Rumpf, MZ, p. 147; for other works see GREEK ART, EASTERN). – Aristonidas (see above).

*d. Goldsmiths.* Mys (Μῦς), probably Attic, second half of 5th cent. B.C.; cup in the Temple of Dionysos at Rhodes (Lippold, RE, s.v., no. 6; for other works see ATTIC AND BOEOTIAN ART). – Akragas

(Ἀκράγας), not earlier than 4th cent.: silver vases for the Temple of Dionysos at Rhodes (E. Pernice, ThB, s.v.; P. E. Arias, EAA, s.v.). – Damokrates (Δάμοκράτης), active in Rhodes at an unknown period: cups (E. Pernice, ThB, s.v.).

*e. Coin engravers.* Xeno[...] (Ξενο[...]), signature on a Rhodian tetradrachma of 400–333 B.C. (A. Glauning, ThB, s.v.).

ARTISTS BORN OR ACTIVE IN KOS. *a. Sculptors.* Praxiteles (q.v.). – Euphranor (Εὐφράνωρ), probably of Kos; first half of 4th cent. B.C.; also a painter, long active in Athens (see ATTIC AND BOEOTIAN ART). *b. Painters.* Apelles (q.v.).

THE CYCLADES AND NORTHERN SPORADES. *Pottery.* The proto-Geometric style of the Cyclades is as yet imperfectly known. The scattered finds indicate that it was subject to Attic influence; in fact, among the proto-Geometric vases imported to Knossos it is sometimes difficult to distinguish the Attic from the Cycladic examples. Some forms, however, are peculiarly Cycladic.

In the Sporades this Attic-Cycladic trend is found in conjunction with a Thessalian tradition. An important series of proto-Geometric vases was found in Skyros: hand-made jugs and cups as well as trefoil-mouthed oinochoai, craters, amphoras, skyphoi, and other vases of Attic type decorated with circles and half circles, undulating lines, and triangles. There is no trace of Mycenaean survival; the break seems complete, in the making of pottery and even, in many cases, in the occupation of sites.

The insular Geometric styles appear less clearly differentiated than those of the Greek mainland. The uncertainties are due in great measure to the circumstances of the finding of vases, because for the most part they come from the pit on the island of Rhenaia into which the contents of the tombs of Delos were thrown pell-mell in the course of the purification of the sacred island in 426 B.C. The custom of limiting the decoration to the upper part of the vase was, to judge from certain vases, maintained longer in the islands than in Attica. On other vases, especially the large amphoras and craters, the profusion of linear and zoomorphic motifs recalls the Attic Geometric style so strongly that they have often been thought to be Attic. Some of the most beautiful examples were found in Cyprus.

Only one style is clearly articulated in the Geometric production of the Cyclades, that of the island of Thera; the workshop there, unlike the others of the archipelago, was little affected by outside influences and produced chiefly amphoras, craters, oinochoai, pyxides, skyphoi, and plates. These vases are covered with a yellowish-white slip, on which the decoration is painted; arranged in metopes and limited to the neck and shoulders, it is dominated by linear motifs, in particular the meander (PL. 9). The activity of this workshop continued with little change, except for the cautious introduction of some Oriental motifs, until the third quarter of the 7th century B.C.

If in Thera no great advance was made beyond the sub-Geometric style, in others of the Cyclades more or less strongly Orientalizing styles arose in the 7th century B.C. Localization of the workshops is as difficult as in the preceding period, because again Delos and Rhenaia are the main sites. A small group of vases (amphoras, kantharoi, deep cups) dating from the beginning of the century, showing mainly Oriental motifs and executed in the sub-Geometric technique of outline drawing, has been hypothetically attributed to a workshop in Siphnos (where several vases were discovered), which does not seem to have been active very long. Other vases come from Delos, Paros, and the isle of Kimolos, near Melos. Another group, consisting chiefly of amphoras, is characterized by simplicity of decoration and clarity of composition: a quadrangle delineated between the handles, devoid of filler motifs, is occupied solely by an animal (stag, lion, or other) with elongated body (PL. 9). The activity of the workshop in question, possibly located on Paros, ceased toward the middle of the 7th century B.C. The griffin-head oinochoe (PL. 9), often attributed to this Cycladic workshop, is not related in style or composition to the amphoras with metopes.

Another series of amphoras, elongated in shape and long-necked, sometimes very tall (up to 40 in.), was probably produced in Naxos. Composition in the first quarter of the 7th century B.C. remains faithful to the principles of the sub-Geometric style: decoration in symmetrically opposed panels on the neck and shoulder, that is, between the handles. An entire animal, a protoma (often that of a horse), or heraldic paired animals appear in the central panel on the neck; an animal or monster (horse, sphinx, or other), in that on the shoulder. The animals painted on a terra-cotta figurine found in Siphnos are in the same style. But the style of Naxos, unlike the Siphnian and the Parian, did not hold to this compromise between the sub-Geometric and the Orientalizing style. In the second quarter of the 7th century B.C. the historiated metopes assume larger dimensions, at the expense of the panels with linear motifs, and expand toward the body of the vase. The Naxian workshop at this time produced some pieces comparable with contemporaneous pottery of Athens and Corinth — for example, the amphora showing Aphrodite and Ares in a chariot drawn by winged horses. These scenes have some features in common with the proto-Attic and, toward the middle of the century, the Rhodian style. The workshop of Naxos did not continue producing beyond this period.

But continuity was assured by another workshop, perhaps located in Melos. Less brilliant than the Naxian workshop at the beginning of the 7th century B.C., that of Melos produced, in the second quarter of the century, amphoras broader of body and shorter of neck, whose decoration spreads over the neck, the body, and down to the foot. A few choice examples (PL. 10) are dependent on the Naxian vases adorned with gods — among them an amphora on which there are scenes of Apollo playing the lyre in a chariot drawn by winged horses and of Artemis holding a stag, and another amphora having a similar scene on the shoulder and a Potnia Theron with lions on the neck. A series of plates found in Delos comes from the same workshop. In the third quarter of the 7th century B.C. Melian pottery borrowed some animal and ornamental motifs from the Rhodian repertory; in the last quarter of the century Corinthian influence is evident in scenes with figures such as the representation on an amphora of the departure of Herakles in a chariot. The Melian style, in turn, disappeared toward the end of the century.

It is possible, but has not been established, that black-figured vases imitating Attic models were produced in the Cyclades during the 6th century B.C. Vases of this type were produced in Ionia, and it is sometimes difficult to distinguish these from Attic examples. In any case, what we are dealing with here is imitation devoid of originality.

Terra-cotta statuettes are found in much smaller numbers in the Cyclades than in other regions of the Greek world. A few have come to light in Paros and Naxos. The two statuettes from Siphnos with their decoration painted in vase technique and style are exceptional. This relative scarcity might be attributed to insufficient study, were it not that even in Delos the archaic and classical statuettes are few compared to the finds of the Hellenistic period. Besides, the bulk of these were imported from Rhodes, Ionia, Cyprus, and Attica. Nor, so far as is known, were any plastic vases produced in the Cyclades.

Two types of reliefs attest to the activity of Cycladic coroplasts in different periods and under different conditions: the reliefs on pithoi and the so-called "Melian reliefs." In the Cyclades the production of pithoi with reliefs extended over a long period, from the 7th to the 5th century B.C. This production, which must have been rather plentiful, has been known until now only from fragments found in Delos, Tenos, Melos, Siphnos, and Thera. Personages and animals are represented (figures with the polos, winged horses, a man being devoured by a bird, hunters on horseback, etc.). Where these vases were made cannot be determined; the closest connection that can be established is with Boeotian pithoi.

The Melian reliefs constitute a homogenous group, coming from one workshop during a span of about thirty years toward the middle of the 5th century B.C. There are more than a hundred; the great majority of those whose provenance is known come from Melos, and there is reason to localize on that island the workshop that produced these small perforated plaques with their slightly provincial and archaizing style. Pierced with holes

around the edge, these were probably to be attached to wooden caskets in the manner of ivory reliefs. The repertory of subjects is taken from mythology: the hunt of the Calydonian boar (PL. 10), the death of Aktaion, Perseus and the Medusa, Ajax and Cassandra, Bellerophon and the Chimaera, Eos and Kephalos, Phrixos and the ram, Helle on the ram, Triton and Theseus, Scylla, Thetis and Peleus, Nereids carrying the arms of Achilles, the ransoming of Hektor's body by Priam, Orestes and Elektra at the grave of Agamemnon, and Odysseus and Penelope.

*Metalwork.* Metalwork was not much esteemed in the Cyclades; no statuettes nor relief plaques nor bronze utensils comparable with the products of Samos, Rhodes, Crete, and the Peloponnesos were produced. A bronze statuette dedicated by Deinagoras in Naxos toward the middle of the 6th century B.C. is not surely in the local style. Probably only a single goldsmith's workshop was active in Melos in the 7th century B.C. Actually two types of jewels were found in the island (and in lesser number in Thera and Rhodes); they are related to the plaquettes of Kameiros in technique and subject matter but differ from them in form. There are long earrings decorated with protomas of griffins and other animals (PL. 16), and large rosettes decorated in the center and on each of the six petals with motifs including birds and bees, human heads, protomas of lions, griffins, and bulls. The circumstances of their finding do not favor the attribution of these pieces to Rhodian goldsmiths; besides, there appear in the treatment of the human heads rather conspicuous stylistic differences from the Rhodian jewels.

*Gems.* It is also in Melos that the majority of the lenticular or oval gems engraved with fantastic creatures, probably dating from the 7th century B.C., were found; on these appear the Chimaera, Pegasos, centaurs, winged genii, and hippocampi. Whether the production of intaglios was continued in Melos or on other islands of the Cyclades between the 6th and the 4th century B.C. is not known. It is virtually impossible to localize the workshops; not even the place of origin is known for the gem carvers who signed their works, except for Dexamenos of Chios (see GEMS AND GLYPTICS; VI, PL. 36).

*Sculpture.* It is in the creation of monumental sculpture that the Cyclades played their most important role. The presence of marble on several of the islands, notably in Naxos, Paros, and Tenos, probably favored this development. The artists took up once more the tradition of those ancestors who had chiseled the Cycladic idols in marble in the 3d and 2d millenniums B.C. The first workshops were certainly established close to the quarries; it is the workshop of Naxos whose activity is earliest attested: the life-size statue of Artemis, carved in coarse-grained Naxian marble, dedicated in Delos by Nikandre of Naxos, goes back to the middle of the 7th century B.C. (PL. 12). It is one of the earliest Greek statues of this size, perhaps the earliest that has come down to us. Only Crete has yielded documents of about the same time. Flat and delicate, the Nikandre *Artemis* differs in its slender proportions from the Cretan statues, which are heavier and more massive. While the Cretan workshops disappeared rather early, in the general decline of the island, those of Naxos produced works — many and various — for at least a century. Two mutilated kouroi found in Delos seem to be Naxian works of the 7th century B.C. The name of one Naxian sculptor of this period, Euthykartides, is known to us: his signature appears on the base of a statue in Delos. The row of lions along the road leading to the Letoon in Delos, which must be dated at about the end of the 7th century B.C., is probably a Naxian ex-voto. Some of the earliest kouroi are also the tallest. Left unfinished in the quarries of the island were two that would have measured about 36 ft. and 18 ft. Three mutilated kouroi found in Thera, which were probably produced in Naxos, were also larger than life-size. The Colossus of Naxos, of which the torso, part of the thighs, and the inscribed base remain in Delos, was a statue of Apollo over 16½ ft. high, dedicated by the Naxians about 600 B.C. In Naxos the head of a kouros of about 580 B.C. was discovered (PL. 12); in its entirety the statue must have measured almost 10 ft. in height. Sculpture from Naxos has also been found outside the Cyclades. One of the korai (no. 677) of the Acropolis of Athens, believed by some to be Samian, is probably a Naxian work. About 570–560 B.C. the Naxians dedicated in Delphi an Ionic column surmounted by a sphinx (PL. 13); the whole monument, which had been carved in Naxos of local marble, was almost 40 ft. high. Toward the middle of the 6th century two similar but shorter columns were consecrated by the Naxians in Delos.

Although Naxos held political and economic hegemony over the Cyclades from the time of Lygdamos up to the Persian Wars, from the beginning of the second quarter of the 6th century B.C. it gradually lost its artistic primacy, especially in the field of sculpture. In this domain Paros must have been its major rival, but actually the existence of a Parian school of sculpture is no more than a probability. Beginning in the middle of the 6th century, however, Parian marble eclipsed that of Naxos in the Greek markets, and it is hardly credible that the finest marble of Greece was exported only in rough blocks as it came from the quarry. But the use of Parian marble is in itself no indication of the origin of a work. In Athens the sculptors and even the architects preferred it to Pentelic marble up to the middle of the 5th century B.C.; in Olympia the statues of the pediments of the Temple of Zeus are of Parian marble. On the island of Paros itself not much sculpture was found; three kouroi, two headless, do not make it possible to define a Parian style (which has been claimed for statues found in Thera, Andros, Melos, and even Boeotia). Naxos and Paros were probably

Delos, plan of the sanctuary: (*a*) Stoa of Antigonos Gonatas; (*b*) Pythion, or "Temple of the Bulls," Hellenistic; (*c*) altar of Zeus Polieus, Hellenistic; (*d–g*) treasuries, first half of 5th cent. B.C.; (*h*) supposed treasury of Karystos, archaic; (*i*) Temple of Apollo (*porinos neos*), archaic; (*j*) Temple of the Athenians, (or Temple of the Seven Statues), 425–417 B.C.; (*k*) peripteral Temple of Apollo, first half of 5th cent., completed 3d cent. B.C.; (*l*) Prytaneion, first half of 5th cent., restored ca. 303 B.C.; (*m*) Ergasteria of the Theandridai, Hellenistic; (*n*) *oikos* of the Naxians, archaic; (*o*) base of the colossus of the Naxians, ca. 600 B.C.; (*p*) propylon, first half of 5th cent. B.C.; (*q*) great altar of Apollo (apsidal monument), 5th–4th cent. B.C.; (*r*) *keraton*, 4th cent. B.C.; (*s*) Artemision, reconstructed in Hellenistic period; (*t*) stoa of the Artemision, Hellenistic; (*u*) *oikos* of Andros, archaic; (*v*) *hieropoion*, archaic; (*w*) Thesmophorion, 489–479 B.C.; (*x*) *ekklesiasterion*, 5th–2d cent. B.C. except northwest section, archaic; (*y*) north building, ca. 402–394 B.C.; (*z*) small archaic temple (*after R. Vallois, Les constructions antiques de Délos, Paris, 1953*).

not the only Cycladic islands to have sculptors' workshops. Besides, differences of style between neighboring workshops are often rather slight and their evaluation rather subjective. The origin of a kouros found in Thera is disputed, being claimed for Paros, Naxos, and Chios. The origin of the *Nike* of Delos, attributed to Archermos, may have been Parian or Athenian. The attribution of the kouros from Melos (PL. 12) to a Parian workshop is not well founded. Two important groups of sculpture of insular Greece and of Asia Minor were found at Delphi; they decorated the treasuries of Knidos (ca. mid-6th century B.C.) and of Siphnos (ca. 530–525 B.C.). Two sculptors collaborated on the Siphnian treasury: the artist of the south and west friezes was probably an Ionian; the east and north friezes (PL. 11) and the partly preserved caryatid may have been the work of an islander, perhaps from Paros, possibly from Chios — or he could even have been from Ionia.

There certainly existed in the Cyclades in the first half of the 5th century B.C. one or more centers that concurrently with Ionia, especially Miletos, carried out in marble studies of athletes in motion comparable to the studies made by the Peloponnesian bronzeworkers. Torsos of athletes from Delos, Thasos, Paros, and Miletos, the so-called "Pollux" of the Louvre, and probably also the first works of Pythagoras are connected with this Ionian and insular trend. It was probably from the island workshops that the master of works at Olympia recruited some of the assistants who executed the sculptures of the Temple of Zeus. Cycladic sculptors may have worked in Crete, Rhodes, and Sidon; Cycladic workshops were also active for mainland Greece in the period from which practically no Attic funerary steles exist, namely, from the end of the 6th to the third quarter of the 5th century B.C. The stele of Orchomenos, of the first quarter of the 5th century, signed by Alxenor of Naxos — a work of good quality but original neither in subject matter nor in execution — was made in Boeotia of local marble. The sculptors of reliefs of the second and third quarters of the 5th century, such as the Giustiniani funerary stele (PL. 8), the stele of the athlete with strigil in Delphi, the disk of Melos, the stele of a girl with doves in New York (Met. Mus.), and the stele of the warrior from Pella were Cycladians, probably from Paros. The Cycladic tradition, uninterrupted during the 5th century, influenced Thessalian and Boeotian sculpture. From the period of the Peloponnesian War, when Athens resumed the production of funerary steles, the votive and sepulchral reliefs of the Cycladic workshops formed part of an Ionian and insular koine whose domain extended from Cyprus to northern Greece.

The vitality of the Cycladic tradition is still apparent in the 5th and 4th centuries B.C., to judge from the great number of insular sculptors, especially Parians, who made names for themselves in the workshops of Greece and Asia Minor. Euphron signed three monuments on the Acropolis of Athens in the second quarter of the 5th century; Agorakritos and probably Lokros were among the group of assistants and disciples of Phidias; Aristandros, perhaps the father of Skopas, worked in Amyklai about 400 B.C. for the Spartans; Thrasymedes was called to work in Epidauros, Skopas (q.v.) in Tegea, Thebes, and Halikarnassos, and Satyros in Halikarnassos and Delphi.

*Architecture.* The hegemony that Naxos, the greatest and richest of the Cyclades, exercised in the archaic period over the entire archipelago must have been reflected in the monuments of the island; unhappily, they are almost all destroyed. Of a great Temple of Dionysos, begun in the second half of the 6th century but not finished, there remains only the door of the *opisthodomos*. In Delos the Naxians erected an *oikos*; its first phase of construction goes back at least to the 7th century B.C. About 600 B.C. it was reconstructed on a plan incorporating axial columns (FIG. 44), with a covering of marble slabs and antefixes decorated with incised gorgoneia. According to tradition it was a Naxian — Byzes — who invented the covering of buildings with marble, at the time of Alyattes of Lydia. About 570–560 an Ionic *prostoon* was added to the *oikos*; about 550–540 the Naxians built an Ionic portico in the sanctuary of Apollo.

Until the middle of the 6th century, Cycladic architecture maintained its Ionic character and was not in the slightest degree influenced by the Greek mainland. The bases of the columns are of the Samian type; the various phases of evolution of the Ionic capital are represented in Delos as well as in the main Greek sites of Asia Minor. The Naxian capitals of the sphinxes in Delphi and Delos (PL. 13) and of the one found in Naxos itself take a leading place, beside those from Naukratis and Ephesos, in the series of monumental Ionic capitals of the second quarter and the middle of the 6th century B.C.

The ground plans of the buildings (temples, *oikoi*) are of east Greek type. In Delos both the Artemision, constructed about 700 B.C. (over an important deposit of Mycenaean material), and the first Heraion, built in the same period, show a cella without *prodromos*, while the Letoon, of about 540 B.C., has a cella preceded by a closed vestibule. The archaic Temple of Apollo (which probably contained the statue of Apollo by Tektaios and Angelion), built toward the middle of the 6th century, was prostyle; the Temple of Dionysos in Naxos was distyle *in antis*; a temple in Paros dedicated to Athena (?), of which Ionic architectural elements of the last quarter of the 6th century remain, was prostyle or distyle *in antis*. The Cyclades had no great peripteral temples comparable with those of Samos and Ephesos.

From the time of Peisistratos the Cyclades were open to influences from mainland Greece. A temple in the Delion of Paros going back perhaps to the middle of the 6th century B.C. is Doric. A group of statues of divinities (Zeus, Athena, Hera, Letoides, etc.) consecrated in Delos at the end of the 6th century bears the imprint of the Attic style. About the same time the Doric order was introduced into Delos in the treasuries, in the second Heraion, and then, after the Persian Wars, in the great Temple of Apollo (begun in the second quarter of the 5th century and completed in the 4th), in the Temple of the Athenians (ca. 420), and in still other buildings. But the Thesmophorion (ca. 480) was erected on a plan of east Greek type, and there are details of construction that invite comparison with Persian architecture.

*Coins.* From the end of the 7th or the beginning of the 6th century B.C., Melos and the islands of the southern Cyclades close to the Peloponnesian shores (e.g., Seriphos and Siphnos), following the example of Aegina and Corinth, minted coins; thus they were among the first Greek states to issue currency. Siphnos possessed gold and silver mines, which Aegina probably availed itself of for its own coinage. The northern Cyclades did not follow the trend until about the middle of the 6th century. Their coins, bearing on the reverse an incused square, have the following symbols on the obverse: kantharos (Naxos), amphora (Andros), lyre (Delos), goat (Paros), grapes (Tenos).

The minting of these coins was interrupted for almost the whole of the 5th century, first by the Persian invasion and then by the establishment of the Athenian League. In the 4th century some of the islands resumed minting, using new motifs on the obverse — the head of a bearded Dionysos (Naxos), the head of Zeus Ammon (Tenos) — and transferring the former symbols to the reverse. In Melos, which remained outside the Athenian League, a series of silver staters was struck in the 5th century, pehaps during the Peloponnesian War — in any case before the year 416, when the Athenians captured the island. These staters, which show on the obverse the old Melian symbol, the pomegranate or quince, bear on the reverse an astounding variety of symbols; on the 79 pieces actually known, 31 different motifs appear (rosette, wheel, crescent, dolphin, ram's head, head of ephebos with pointed cap, triskelion, gorgoneion, amphora, murex, star, etc.). The intention in minting these staters was probably to put them into competition with the Athenian coins in international circulation. Some of the dies for coins were made by engravers of gems. The Pegasos of Melian intaglios is related to the Pegasos on the earliest Corinthian coins.

ARTISTS OF THE CYCLADES AND NORTHERN SPORADES. *a. Architects of Paros.* Satyros (Σάτυρος), son of Isotimos (or of Apollo[doros]?) and father of Lykos, mid-4th cent. B.C.; also sculptor and, together with Pytheos, author of a treatise on architecture and perhaps of one on the qualities of stones; worked with Pytheos at the mausoleum at Halikarnassos (also as sculptor?): bronze statues of Idrieus and his

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

wife Ada in Delphi, of which the base remains (346–344 B.C.); to him are also attributed the *Mausolos* and *Artemisia* at Halikarnassos and the Sarcophagus of the Mourning Women from Sidon; transportation of an obelisk, in Egypt (Lippold, GP, p. 254; Marcadé, 1953, no. 93; Picard, IV, p. 70 ff.; H. Drerup, JdI, LXIX, 1954, p. 1 ff.).

*b. Sculptors born or active in Paros.* Archermos (Ἄρχερμος) of Chios, first half of 6th cent. B.C.: perhaps made the votive gift on a base in Delos with dedication by Mikkiades of Paros (see GREEK ART, EASTERN). – Sogenes (Σωγένης) and Xenon (Ξένον) of Paros, 6th cent.: inscription on a fragment of a statue of a warrior (M. Bieber, ThB, s.v.). – Charopinos (Χαροπῖνος) of Paros, probably merely the father of some offerers or a sculptor active in Delphi, second half of 6th cent.: signature on the base of a statue of a kouros and in the fluting of a votive column (Lippold, GP, p. 68; Marcadé, 1953, no. 21). – Kritonides (Κριτονίδες) of Paros, probably second half of 6th cent.: signature on an Ionic column found probably in the Peloponnesos (Lippold, GP, p. 68). – Aristion (Ἀριστίων) of Paros, second half of 6th cent., active in Attica (see ATTIC AND BOEOTIAN ART). – Palion (Πάλιον) of Paros: signed relief of Ikaria, 470 B.C., similar in subject to the Ino and Leukothea in the Villa Albani, Rome (BCH, LXXX, 1956, I, p. 334). – Euphron (Εὔφρων) of Paros, probably first half of 5th cent., active in Attica (see ATTIC AND BOEOTIAN ART). – Aristandros (Ἀρίστανδρος) of Paros, probably father of Skopas, second half of 5th cent.: female figure with lyre at Amyklai (Picard, III, 2, p. 635; Lippold, GP, p. 230; P. Orlandini, EAA, s.v.). – Agorakritos (Ἀγοράκριτος) of Paros, pupil of Phidias and competitor of Alkamenes, last decades of 5th cent., active in Athens (see ATTIC AND BOEOTIAN ART). – Alkippos (Ἄλκιππος) of Paros, end of 5th or beginning of 4th cent.: signed base of a votive gift to Apollo at Anaphe (Lippold, GP, p. 231; P. Orlandini, EAA, s.v. – Thrasymedes (Θρασυμήδης) of Paros, son of Arignotos, first half of 4th cent.: gold and ivory statue of Asklepios, at Epidauros, attributed by tradition also to Phidias (Picard, III, p. 214 ff.; Lippold, GP, p. 230). – Skopas (q.v.).

*c. Painters of Paros.* Mnasilaos (Μνασίλαος) and Nikanor (Νικάνωρ), 5th cent. B.C., practiced encaustic painting; Mnasilaos was erroneously credited with a statue of Artemis (see below; Pfuhl, I, p. 503; S. Ferri, Plinio il vecchio, Rome, 1946, p. 189).

*d. Architects of Naxos.* Byzes (Βύζης), stonemason, beginning of 6th cent. B.C., father of Euergos (see below), probably active in Athens; inventor of marble tiles (see ATTIC AND BOEOTIAN ART). – Leonides (Λεωνίδης), second half of 4th cent., dedicated and constructed the Leonidaion in Olympia; perhaps author of a work on proportions in architecture (C. Weickert, ThB, s.v.; Dinsmoor, p. 251).

*e. Sculptors of Naxos.* Euthykartides or Iphikartides (?) (Εὐθυκαρτίδης), 7th cent. B.C.: boustrophedonic inscription on the base of a statue of a kouros from the temenos of Apollo in Delos (Lippold, GP, p. 43; Marcadé, 1957, no. 45). – Euergos (Εὐέργος); son of Byzes (see above), first half of 6th cent.: dedicated in Naxos some statues of Apollo (Lippold, GP, p. 42). – Arkesilaos (Ἀρκεσίλαος), son of Aristodikos, probably of Naxos, end of 6th–beginning of 5th cent.: statue of Artemis, formerly attributed to Mnasilaos, painter of Paros (see above; Lippold, GP, p. 114; M. T. Amorelli, EAA, s.v.). – Alxenor (Ἀλξήνωρ) of Naxos, late 6th–early 5th cent., active in Boeotia (see ATTIC AND BOEOTIAN ART).

*f. Sculptors active in Delos.* Daidalos (see above under Crete). – Euthykartides (see above). – Archermos (Ἄρχερμος) of Chios, first half of 6th cent. B.C.; perhaps made a votive gift dedicated by Mikkiades, found in Delos, with which a Nike found in the neighborhood has been erroneously connected (see above; see also GREEK ART, EASTERN). – Angelion (Ἀνγελίον) and Tektaios (Τεκταῖος), of unknown origin, pupils of Dipoinos and Skyllis and teachers of Kallon of Aegina; ca. mid-6th cent. B.C.: colossal statue of Apollo in wood and gold, with bow and the Charites (Graces) on his hand, in Delos; Artemis, place unknown (Picard, I, pp. 160 and 572 ff.; Lippold, GP, p. 45; M. T. Amorelli, EAA, s.v.). – Athenis (Ἄθηνις) and Boupalos (Βούπαλος) of Chios, second half of 6th cent.: many statues in Delos and neighboring islands (see GREEK ART, EASTERN). – Kleoteles (Κλεότελης), sculptor ?: fragmentary inscription on the base of an altar, end of 5th cent. (Lippold, RE, s.v. suppl. VIII; Marcadé, 1957, no. 63).– Praxiteles (q.v.). – Praxias (Πραξίας), son of Praxias, of Athens: signature on a base of 366 B.C. from Delos formerly attributed to the sculptor of the same name, son of Lysimachos (Marcadé, 1957, nos. 112–13; see ATTIC AND BOEOTIAN ART).

*g. Painters active in Delos.* Kolotes (Κωλώτης) of Teos, 4th cent. B.C., competitor of Timanthes: paintings in an unspecified building (Pfuhl, II, p. 697).

*h. Sculptors born or active in other islands.* Arimanos (Ἀρίμανος), sculptor (?) of the archaic period, belonging to the circle of Melas of Chios, according to an inscription from Thera (L. Guerrini, EAA, s.v.). – Eunos (or Eunoos ?, Εὔνος, Εὔνοος), of the archaic period: decoration of a sepulchral monument at Sikinos (Picard, I, p. 580; G. Lippold, RE, s.v., suppl. VIII). – Alkidamas (Ἀλκιδάμας) of Siphnos, second half of 6th cent. B.C.: signature on base of a statue in Keos (Lippold, GP, p. 70; L. Guerrini, EAA, s.v.). – Archedamos (Archedemos ?; Ἀρχέδαμος) of Thera, second half of 6th cent., active in Attica (see ATTIC AND BOEOTIAN ART).

*i. Painters born or active in other islands.* Ekphantos (Ἔκφαντος), active in Melos; end of 7th–beginning of 6th cent. B.C.: inscription on a column bearing a work dedicated and painted by him (W. Amelung, ThB, s.v., no. 1). – Timanthes (Τιμάνθης) of Kythnos, of the school of Sikyon, end of 5th–beginning of 4th cent.: sacrifice of Iphigeneia, executed in competition with Kolotes of Teos; sleeping Cyclops; murder of Palamedes at Ephesos (?); Eros (taken to Rome); Ajax in Samos, executed in competition with Parrhasios (G. Lippold, RE, s.v., no. 1; Rumpf, MZ, p. 120). – Kydias (Κυδίας) of Kythnos, middle of 4th cent., the first to use burnt ocher for shading: painting of the Argonauts, acquired by the Roman orator Hortensius (Rumpf, MZ, p. 129).

THE THRACIAN ARCHIPELAGO. *Thasos.* A group of colonists from Paros, among them the poet Archilochos, settled in Thasos at the beginning of the 7th century B.C. During this century and in the early part of the following one, the Thasians imported Melian, Rhodian, Aeolian, and, to a lesser degree, Corinthian ware. From the middle of the 6th century on, Attic ware took the lead. Beginning in the 7th century, however, painted vases — craters, dinoi, lekanai — were produced by a local workshop. The products of Thasos also include, from the end of the 7th century, terra-cotta tripods decorated with figures of hippocampi, Tritons, griffins, and sphinxes in low relief; their style has connections with that of the Melian vases, intaglios, and jewelry. In the 6th century B.C. the workshops of the island turned out terra-cotta figurines whose makers drew their inspiration from east Greek types.

Thasos is rich in marble. The finding of significant numbers of statues and reliefs in the local stone testifies to the existence of workshops of sculptors right on the island. Their activity continued without interruption from the 7th century B.C. until Roman Imperial times; some of the works are of high quality. The earliest one is an unfinished statue of a kouros holding a ram, almost 12 ft. high, dating from the end of the 7th or the beginning of the 6th century B.C.; the style is Cycladic, the posture Anatolian. A head of a kouros of the middle of the 6th century also has Cycladic connections, perhaps more especially with Paros, if, as it seems logical to assume, the political and economic closeness between the founding city and the colony was accompanied by an artistic exchange.

About 500 B.C. the city of Thasos erected an encircling wall approximately $2^1/_2$ miles in length, built entirely of marble blocks. The inside of the gates was decorated with reliefs, following a practice current in Asia (in Hittite, Assyrian, and Persian city and palace gates) but — except for this one example — unknown in the Greek world. The walls of Thasos were partially destroyed in 491, at the time of the Persian thrust against Greece, and again in 463 after the conquest of the city by Kimon; in 411 they were reconstructed by the oligarchs hostile to Athens. Six reliefs, from five gates, have been found. Five of the reliefs antedate the Persian Wars: Herakles with bow, a Seilenos with kantharos (PL. 14), a Dionysiac procession, a goddess in a chariot, Semele brought back from Hades (?). A relief with Zeus and Iris (?) dates from the time of the reconstruction of the city walls, late 5th or early 4th century B.C.

The two main cults of Thasos were those of Dionysos and Herakles; the sanctuaries of both have been discovered. The remains of a temple of the 7th century B.C. inside the sanctuary of Herakles show that its ground plan resembled those of Prinias and Dreros (interior altar between two columns along the axis of the building). During a remodeling carried out about 540–525 B.C., the Herakleion was decorated with terra-cotta reliefs: antefixes showing a gorgoneion, the Chimaera, Bellerophon astride Pegasos (PL. 14), a frieze representing riders and

Thasos, plan of the agora: (*a*) Building of poros, classic period, with Hellenistic façade; (*b*) building with paraskenia, mid-4th cent. B.C.; (*c*) storehouses, Hellenistic and Roman; (*d*) passage of the Theoriai, ca. 470–460 B.C.; (*e*) northeast stoa, 1st cent. B.C.; (*f*) tholos, 2d cent. B.C.; (*g*) temenos of Zeus Agoraios, 4th cent. B.C.; (*h*) altar of Lucius (and Caius?) Caesar, with statue bases before it; (*i*) altar, late classic; (*j*) Glaukos monument, second half of 7th cent. B.C.; (*k*) northwest stoa, 3d cent. B.C.; (*l*) southeast stoa and commercial area, 1st cent. B.C.–1st cent. our era; (*m*) exedrai, 2d–1st cent. B.C.; (*n*) great altar, 3d cent. B.C.; (*o*) southwest stoa, 1st cent.; (*p*) base of Thesauros of Theogenes, and altar, 3d cent. B.C.; (*q*) base of a monument in the form of a ship's prow, 2d cent. B.C.; (*r*) office of the *epistatai*, 4th–2d cent. B.C.; (*s*) sanctuary of Theogenes, Hellenistic (*after R. Martin, Etudes thasiennes: VI, L'Agora, Paris, 1959*).

dogs pursuing a hare. From two other monuments in Thasos come fragments of painted terra-cotta friezes portraying similar hunting scenes. The use of painted terra-cotta bands of decoration in buildings establishes a connection between Thasos, Anatolia (Aeolia, Phrygia, Ionia), and Etruria. The choice of subjects links the monuments of Thasos with the temple at Palaikastro in Crete and, more especially, with buildings at Sardis and Larisa in Aeolis. A marble block decorated with the protoma of Pegasos (PL. 14), which comes from another building in the sanctuary of Herakles, constructed at the end of the 6th century B.C., shows that at this time the sculpture of Thasos, like that of the Cyclades, was beginning to be affected by the influence of Attica. The sanctuary of Herakles also contained a peripteral, probably Ionic, building whose door frame was decorated with a heart-and-dart pattern comparable to the Ionic decorations of the 6th century, of which numerous elements were found in Thasos. But the style is archaizing, and the building is not earlier than the 5th — perhaps even the 4th — century. Of the temples that stood on the acropolis of Thasos, the one dedicated to Athena Poliouchos has not been identified and the one dedicated to the Pythian Apollo, rebuilt in the 5th century B.C., was completely destroyed. Apollo was also venerated, as Nymphagetes, in the lower city, close to the harbor. Reliefs representing Apollo playing the lyre, accompanied by nymphs, Hermes and a female figure, and three Charites (Graces) were found to the northeast of the agora, where they were originally attached to the walls of a passageway. These fluent and graceful reliefs have often been dated in the neighborhood of 500 B.C., but since the sculpture from Thasos is intentionally archaizing, they are probably no earlier than 480–470 B.C.

The prosperity of Thasos in the 6th century B.C. was due in large part to the exploitation of the gold and silver mines of the region around Mount Pangaion. From the middle of the century, the Thasians minted silver staters and drachmas decorated on the obverse with the scene of a satyr abducting a nymph; in type and style these differ only slightly from the coins issued by the neighboring Thracian peoples. This minted silver was widely exported as raw material to the entire Mediterranean region, particularly the eastern part. In the second half of the 6th and the beginning of the 5th century the hoards of Egypt,

Syria, and Phoenicia contained many pieces from Thasos and Thrace; pieces have been found as far away as Tarentum and Metapontum. The capture of Thasos by the Athenians, in 463, put an end to the international circulation of its coins. After an interruption of several years the workshops of Thasos became active once more: Athenian influence was apparent now not only in the adoption of the Attic weight but also in the style of the pieces; they no longer had the crude forcefulness of the examples from the preceding century. After the revolt of 411 B.C., Thasos adopted new monetary types: on the obverse a head, usually that of Dionysos, on the reverse Herakles with bow (PL. 16), or a dolphin, or an amphora. The amphora reminds us that, along with the silver trade, but more enduringly, the wine trade was the islanders' chief source of wealth. Such amphoras, with names and various symbols on their handles, were found throughout the Mediterranean world; the majority date from the Hellenistic period, but the earliest ones go back to the 5th and 4th centuries B.C.

Artistic activity continued in Thasos during the political vicissitudes of the 5th century B.C. If Polygnotos (q.v.), who was born there, pursued his career as a painter in Athens and Delphi, the sculptors of the island maintained the quality of its artistic output. One of the earliest and most beautiful votive reliefs, an example showing a funeral banquet, was produced toward the middle of the 5th century B.C. (PL. 14); other examples belong to the 4th century. This type of relief had its greatest success in the Hellenistic period. The funerary stele of Philis (Louvre) is in the mainstream of the Cycladic tradition between 450 and 420 — in all likelihood, given the archaizing tendencies of Thasian sculpture, toward the end of this period.

From the end of the 5th and throughout the 4th century B.C., the sculpture of Thasos, like that of the Cyclades and of Rhodes, formed part of the Aegean-Ionian koine, strongly under Attic influence, and it is no longer possible to distinguish the contributions of individual workshops. In the 4th century it was in the field of architecture and city planning that the Thasians were outstanding. The agora of the city (FIG. 49) was completely transformed, in accordance with Ionian principles of urban development, into a parallelogram of about 330 by 265 ft., flanked by long Doric colonnades. This plan was not fully realized until the Hellenistic period.

*Samothrace.* The island of Samothrace owes its fame chiefly to the mystery cult of the Kabeiroi. The earliest installations of which traces remain (cyclopean wall, rock altar) are earlier than the 7th century B.C.; they are the work of a Thracian people whose language remained in use during the entire 1st millennium B.C. Literary tradition has it that the Greek colonists came from Ionia in the 2d millennium B.C., while archaeological evidence points to their coming from Aeolis in the 7th century B.C. There is hardly any documentation of Samothracian art in the archaic period. In a deposit of the 7th century B.C. the local pottery is still indigenous in style, and whatever pottery is Greek is imported. In the 6th century B.C., however, the Greek city situated close to the sanctuary of the Kabeiroi, and the sanctuary itself, seem to have undergone an important development; it is from this period that a part of the city wall probably dates. Among the ruins of archaic monuments of the sanctuary there are remains of altars, of a portico with a Doric colonnade from the middle of the 6th century, and of an initiation hall, or anaktoron, constructed about 500 B.C. and remodeled in the Hellenistic period. In the second half of the 6th century and up until the Persian Wars, Samothrace issued silver coins bearing on the obverse a head of Athena or a sphinx.

Painted vases and terra cottas discovered in the course of excavations after World War II have not yet been published. It is not known whether a marble relief of the middle of the 6th century B.C. representing Agamemnon, Talthybios, and Epeios (PL. 14) is a local work. Neither the city nor the sanctuary was enriched by new constructions during the time of the Athenian domination, and the only coins that were struck were of bronze. From the beginning of the second half of the 4th century, great activity was seen again in the sanctuary of the Kabeiroi, but this brings us to the dawn of the Hellenistic period, to which the main monuments of the sanctuary belong (see HELLENISTIC ART).

*Lemnos.* In the archaic period an art of some originality flourished in Lemnos. The necropolis of Hephaistia has yielded, together with imported Greek pottery, vases and terracotta statuettes of local manufacture (PL. 15) which can be dated probably in the 8th and 7th centuries B.C. What role the art of Lemnos played in the world of the Aegean and Asia Minor has not yet been determined. It is possible that the main decorative elements, meanders and spirals, derive from the Mycenaean tradition, but on the island itself so far no indication of continuity between the Mycenaean and the archaic period has been found. The motifs would therefore have been transmitted through the art of other regions, probably in Asia Minor (Aeolis, Phrygia?). The same decoration is found carved in stone, on funerary steles. Personages are painted on vases and on idols (PL. 15): lyre players before a divinity; a goddess with lion cub attacking a lion. The style is not completely unrelated to the art of the Aegean Islands and Asia Minor; at the same time it has characteristic traits of its own.

The most famous monument of Lemnos is the funerary stele of Kaminia. This has an inscription in Tyrrhenian, which seems closer to the Etruscan than to any other language. The relief carved on the stele, if it is not of Greek type, does reflect Ionian art. The Athenian cleruchs in Lemnos commissioned Phidias to make a bronze statue of Athena, and they dedicated it on the Acropolis of Athens. Alkamenes was perhaps descended from one of these families of colonists. But in Lemnos itself, no artistic centers or works of art are known from the period of Athenian domination — any more than they are in Imbros. Neither island minted coins before mid-4th century B.C.

ARTISTS OF THE THRACIAN ARCHIPELAGO. *a. Sculptors born or active in Thasos.* Lokros (Λόκρος) of Paros, appears in an inscription of 403–402 B.C. (see above, *Artists of the Cyclades and Northern Sporades*). – Agatharchos (Ἀγάθαρχος), probably of Thasos, active ca. mid-4th cent.: signed base with dedication to Pan and Aphrodite (Lippold, G.P., p. 249, no. 6; L. Guerrini, EAA, s.v.). – Praxias (Πραξίας), son of Praxias of Athens: signed base datable 350–340 B.C.

*b. Painters of Thasos.* Aglaophon (Ἀγλαόφων), father and master of Polygnotos and Aristophon, beginning of 5th cent. B.C.: said to have been the first to paint the winged Nike (Pfuhl, II, pp. 639–70; M. Cagiano de Azevedo, EAA, s.v.). – Polygnotos (q.v.). – Aristophon (Ἀριστοφῶν), son and pupil of Aglaophon, probably father of Aglaophon the Younger, first half of 5th cent.: Ankaios helped by Astypalaia; a painting with many figures, among them Priam, Helen, and Odysseus, interpretation doubtful; Philoktetes. Attributed works include Alkibiades crowned by Olympias and Pythias; Alkibiades crowned by Nemeas; Ilioupersis (Pfuhl, II, pp. 639, 670; F. Magi, EAA, s.v.). – Aglaophon the Younger (Ἀγλαόφων), probably son of Aristophon, second half of 5th cent., active in Athens (see ATTIC AND BOEOTIAN ART). – Neseus (Νησεῦς), master of Zeuxis, second half of 5th cent. (Lippold, RE, s.v., no. 1). – Polykleitos (Πολύκλειτος), sometimes identified with Polygnotos; probably also sculptor, 4th cent.; active in Attica (see ATTIC AND BOEOTIAN ART). – Aristomenes (or Aristomachos?; Ἀριστομένης, Ἀριστόμαχος?), can also be identified with an artist of the region of the Strymon, chronology uncertain: ex-voto of three hetairai to Aphrodite (Pfuhl, II, p. 917; L. Guerrini, EAA, s.v. Aristomachos; L. Forti, EAA, s.v. Aristomenes).

*c. Artists born or active in Lemnos.* Smilis (Σμῖλις), sculptor and architect of Aegina, contemporary of Daidalos: worked at the Lemnian labyrinth together with Rhoikos and Theodoros of Samos (for his other works see PELOPONNESIAN ART). – Glaukos (Γλαῦκος), sculptor of Lemnos, of unknown period (W. Amelung, ThB, s.v., no. 3).

CONCLUSIONS. Within the framework of an artistic development common to all Greek territories, each of the Aegean islands preserved, in the first half of the 1st millennium B.C., a measure of independence. Local nuances cannot be explained solely by the geographical dispersion of the islands: local artistic traditions and political and economic factors also played a part.

From the 10th to the 8th century B.C. the art of the islands is represented almost exclusively by painted pottery, a field in which the Athenian workshops had acquired a mastery whose influence was felt throughout the Aegean area. But the develop-

ment was not everywhere marked by the same rhythm: the transition from the proto-Geometric to the Geometric style came about sooner in the Dodecanese than in the Cyclades. The Geometric vases of the Cyclades, and even more markedly those of Rhodes and Kos, retained their distinctive features. The destiny of Crete, from the beginning, took a separate course from that of the other islands, and a distinction can even be drawn between the rest of the island and the region of Knossos. There the Mycenaean tradition, though it had declined, remained alive; on the other hand, the Geometric style, from the 9th century B.C. on, presented Oriental characteristics. In Crete there was no clear demarcation between a style that was Geometric and a style that was Orientalizing.

Though the Orientalizing style was a generalized phenomenon in Greek art from the 8th to the 7th century B.C., its influence did not carry the same weight in the various branches of art, nor did it affect the various centers of production at the same time. The Aegean Islands, Crete excepted, were stepping stones between the continent of Asia and Greece proper, yet they followed Corinth and Athens in adopting Oriental motifs. Rhodes, the nearest of all the islands to the artistic and commercial centers of the Near East, is known to have established contacts with Cyprus, Cilicia, and Phoenicia by the end of the 9th or the beginning of the 8th century B.C. Nevertheless, Rhodian pottery did not develop an Orientalizing style until the middle of the 7th century; besides, this style was very different from those of Athens and Corinth, and must certainly have drawn its inspiration from other Oriental sources.

The art of vase painting had deep roots in Greece and was probably more resistant to foreign influences than metalwork, in which the superiority of the Orient was unquestioned. Whether made in Crete or not, whether made by Cretan artists or by foreigners, the bronze reliefs attest to Eastern influence in Crete in the 8th century B.C. — perhaps beginning at the end of the preceding century. If the generally accepted dates are correct, the goldsmiths created an Orientalizing style in Rhodes a generation before the potters.

Rhodian art, closely bound to that of the Ionian coast in most of its manifestations, is essentially decorative. The Rhodians acquired from their eastern neighbors a taste for objects at once practical and attractive — as well as easily salable in distant markets. Oinochoai in the Kameiros style, plastic vases of terra cotta and of faïence, statuettes, and masks supplied the answer to this demand. Active in the western Mediterranean from the 8th century on and chief competitors of the Corinthians in the 7th, the Rhodians maintained first place in the trade in statuettes until the beginning of the 5th century. After the shutting down in succession of the workshops of Crete, the Cyclades, and Corinth, and until the end of the 6th century B.C., they even competed to a certain degree with the Athenian potters. Among the Cyclades one island, namely Melos, which probably produced painted vases, jewelry, intaglios, and terracotta reliefs, seems to evidence a similarity in taste to Rhodes.

In the evolution of monumental sculpture, which began about the middle of the 7th century B.C., Rhodes played no part. After a brilliant beginning in this field as in others, Crete disappeared from the scene, for reasons, no doubt political and economic, that have not been made clear. Then the Cyclades, at least some of them, came to the fore — first Naxos, for about a century, then probably Paros. Cycladic sculpture occupies a special place between that of Ionia and of Athens; a reflection of it, with a shade of provincial archaism, is found in the production of Thasos.

Thasian art poses another problem, that is, the relations between indigenous art and that of colonists. No trace of indigenous art appears in Thasos from the 7th century B.C. on. Although the Thasians borrowed from Anatolia the use of terra-cotta friezes in architecture and of reliefs over city gates, the style of such works is completely Greek. However, in Samothrace and even more in Lemnos indigenous and Greek elements are blended in original combinations.

In architecture, which is more closely linked than any other branch of art to political and economic conditions, the islands of the Aegean Sea did not experience an efflorescence comparable to that of Ionia, mainland Greece, Sicily, and Magna Graecia. But Crete in the 7th century B.C. and the Cyclades in the 7th and 6th had a part in the evolution of Ionic architecture.

The sacred character of the island of Delos occasioned the dedication there of temples, *oikoi*, porticoes, and other structures. When, in the 5th century B.C., Athenian domination slowed down or put an end to artistic activity in most of the islands, the workshops of Delos were the only ones to continue to produce. It seems as if during this period some sculptors' workshops remained active in Thasos and in the Cyclades, especially Paros. This island produced some famous sculptors in the 5th and 4th centuries B.C., but they left for the great workshops of the mainland and Asia Minor to carry out commissions that they could not have hoped to receive at home. Thus arose, from one shore of the Aegean Sea to the other, the artistic community that preceded political union.

**GREEK ART, EASTERN.** East Greek art is the art of the Greeks of the western coast of Asia Minor and the adjacent islands. When history begins, this region was divided into three parts according to dialect and religious associations. To the north, from the Troad to Kyme, was Aeolis with the island of Lesbos. Next came Ionia, reaching from Phokaia to Miletos and including the islands of Chios and Samos; other archaeologically important cities were Klazomenai and Ephesos and (though at first it had been Aeolian) Smyrna. To the south were the

Dorians, whose main settlements were in Halikarnassos, Knidos, Kos, and Rhodes. But the art of these Aeolians, Ionians, and Dorians had a general unity, which till the 6th and even the 5th century B.C. was distinct from that of the neighboring islanders of the Cyclades and still more from the European Greeks; in architecture the distinction persisted till the mid-4th century B.C. Of the three divisions Ionia was the most important and it might be expected to have had a finer version of East Greek art; indeed, some scholars believe in a distinctively Ionian art.

The importance of East Greek art is disputed. Certainly it had a powerful impact on the non-Greek region behind the western seaboard of Asia Minor and according to some specialists had effects in Cyprus. In Greece proper it transformed the female type of archaic sculpture, though this transformation was impermanent, and introduced the Ionic style of architecture; but few other claims are made today. There is more disagreement over the Greek colonies of the West and over Etruria; some see a pervasive East Greek influence on local artists, others little more than casual contacts. The author of this article is one of the skeptics, but differing opinions appear elsewhere in this Encyclopedia (see ASIA MINOR, WESTERN; CYPRIOTE ART, ANCIENT; ETRUSCO-ITALIC ART; MEDITERRANEAN, ANCIENT WESTERN).

SUMMARY. General considerations (col. 57). Painting (col. 59): *Pottery: a. Proto-Geometric and Geometric; b. Bird bowls; c. The transition to Orientalizing; d. Wild-goat style; e. Sciot ("Naucratite") styles; f. Fikellura style; g. Ionian Little Master cups; h. Clazomenian and other East Greek black-figure; i. The East Greek situlae; j. Vroulian style. Clazomenian sarcophagi; East Greek workshops abroad.* Sculpture (col. 76). Architecture (col. 81). Conclusions (col. 86).

GENERAL CONSIDERATIONS. The origins of the East Greek settlements are obscure. In Rhodes and Kos archaeological finds and ancient tradition agree that there were Greek inhabitants in the late Bronze Age. But though, it is said, there are traces of a Mycenaean (or Greek late Bronze Age) settlement at Miletos and though there are a few relics elsewhere, most of the East Greek region seems to have been occupied for the first time by Greeks in the Iron Age, or (as the ancient writers put it) after the Dorian invasion. Tradition also says that many of the Ionian colonists set out from Athens and that in some places, particularly Miletos, they intermarried with the native women captured there. But such connections are not important, since the East Greek cities did not maintain close ties with their homeland and blood is less important than culture.

Knowledge of East Greek art is as yet very uneven. In Hellenistic and Roman times, many cities of the region were prosperous, and excavators have not often penetrated below the rich levels of those periods. In the island of Rhodes, where the population shifted to a new city at the end of the 5th century B.C., several earlier cemeteries have been found and published, as have some graves in Kos and a cemetery in Nisyros. In Samos the rich sanctuary of Hera has been found, and in Chios the precinct of Apollo Phanaios and a small town at Emborio. (The Samian finds are in large part known, while more from Chios await publication.) From the sanctuaries of Ephesos and Didyma some important objects have come to light. At Klazomenai, Miletos, and Sardis little of the early material excavated has been made available. Old Smyrna has been investigated and is in process of publication. From Aeolian Larisa there are architectural fragments and pottery; and from Lesbos and other sites, isolated monuments. Because of this unsatisfactory state of research, it is difficult to make comparisons between different parts of the East Greek region; the finds are patchy and cemeteries cannot justly be compared with sanctuaries.

Since ancient writers made few comparisons between the artistic achievements of the different regions of the Greek world and none regarding the pottery, modern study of East Greek art should have been able to proceed without prejudice. But the archaeologists proved too ingenious. In 1879 Adolf Furtwängler suggested that the Orientalizing style of East Greek pottery, in contrast to most of the Orientalizing styles of European Greece, evolved directly from Mycenaean art. The suggestion was quickly accepted and developed: the Ionians — a term of elastic extension — were considered the survivors and heirs of Mycenaean culture and the pioneers of all Greek progress till the late 6th century B.C. In consequence, East Greek art was regularly dated too early — awkward contexts were ignored or suppressed — and many of the products of Etruria and even of European Greece were claimed for Ionian craftsmen or their disciples. This Pan-Ionism was rampant in the late 19th century and afterward gradually declined, but its effects still survive, especially in the study of archaic Greek sculpture and in the archaeology of the western Mediterranean, where Ionian influence is likely to be discerned in any plump Etruscan figure, and cups decorated with simple bands of paint may be dubbed Ionian, although finer and

demonstrably Ionian imports are so rare as to be negligible. In any reference to Ionian art the reader should first discover what "Ionian" means; it is too easy, for instance, to reckon Siphnos and Euboea as Ionian, form conclusions about the art of these islands, and then extend such conclusions to Ionia in Asia. The term "East Greek," fortunately, is less abused.

Of the arts of the Greeks, some (textiles, furniture, wall paintings) have perished almost entirely. Most of the surviving examples can be grouped under the categories of painted pottery, sculpture, and architecture — the order of discussion is not that of artistic importance but derives from the age of the earliest examples, and probably of the arts themselves (see ARCHAIC ART; CLASSIC ART).

PAINTING. *Pottery. a. Proto-Geometric and Geometric.* Very little proto-Geometric pottery has been found in the East Greek region. The two large series found in Kos and Old Smyrna await full publication. Some examples are known from sites in Rhodes and from Asarlik in Caria, and there are stray pieces from other sites. Whether this rarity is accidental or significant, that is, as an indication of whether Greek settlement generally took place during or after the proto-Geometric period, cannot yet be decided. Still, it appears that the East Greek proto-Geometric style did not evolve on its own from any local Mycenaean school but was derived directly or indirectly from the mature proto-Geometric style of Athens. Once established, however, such East Greek workshops as there were proceeded in their own ways. In Kos the cup, in particular, shows a preference for panels filled with crosshatched lozenges and triangles, while from Rhodes there are pieces that closely parallel those of Kos as well as others that exhibit a different stylistic trend. A little evidence also suggests that in the East Greek region the proto-Geometric style ended at much the same time as in Attica.

The Geometric remains from East Greek sites are more numerous. There are whole pots from Rhodes and Kos; shards from Samos, Ephesos, Smyrna, and Chios; and a few published specimens from other sites. In Rhodes, where the development can to some extent be followed, it appears that early Geometric work (as in Greece) favored a single continuous band of ornament and late Geometric tended to multiplication and division of the decorative fields (PL. 17). Recurrent motifs are crosshatched lozenges and triangles, rows of large concentric circles, the hatched or crosshatched meander (though meanders are less regular here than across the Aegean), and a sort of square hook. This hook, an East Greek specialty, is usually doubled and is attached to the free angles of lozenges and triangles. Of figure motifs, only birds are at all common; these are the usual Geometric type with plump, hatched bodies. A more ambitious figural style, which attempts animals and men, is visible in Samos and in more inept versions in Chios. On both of these islands a whitish slip was sometimes used, at least in the late Geometric period.

Although there are local variations in East Greek Geometric, exaggerated perhaps by excavators, there is a general likeness in the repertory and manner of decoration. It is a loose and often unbalanced style — in its earlier stage perhaps and in its later probably influenced by Attic tendencies, and at the end sometimes imitating Corinthian. Connections with Cycladic also are likely, and occasional borrowing from Cyprus can be discerned. Presumably the East Greek Geometric style developed early in the 9th century B.C., not long after the Geometric style had evolved in Greece; the date of its abandonment is disputed. The clay is normally a light brown, and the paint dark brown to blackish. Except where slip is used, the effect is like that of much Geometric ware in European Greece (PL. 17).

*b. Bird bowls.* The neatest and most lasting legacy of the East Greek Geometric is the so-called "Bird bowl" (PL. 17). The shape, which may derive from the late Geometric kotyle, was already established by the beginning of the 7th century B.C. The bowl is regularly small and shallow and without a distinct lip; on earlier examples the rim is often nicked. There are two thin handles. The foot is usually a low ring foot but in later examples tends to be rather higher or more modeled. The decoration is equally standardized. On the outside the upper part is divided into three panels, the middle and widest panel containing a crosshatched bird and each of the flanking ones a crosshatched lozenge. Even the sparse filler ornament around the bird has regular forms and positions. The lower part of the bowl was at first painted dark all over but about the middle of the 7th century was enlivened by five large rays drawn in thick outline. The inside is covered with dark paint, over which, in the later part of the century, narrow bands of white and purple were sometimes added. The clay is normally a fine light brown, though some groups have a whitish slip; the paint has a sheen and varies from blackish to red, and the execution is precise. With their mannered, almost pedantic elegance these Bird bowls are as good as any Greek class of sub-Geometric ware — for they are obviously not Geometric in style. Where the type originated is not known, and the claim commonly made for Rhodes is based on the accident that examples from that island have been known for a long time and are complete. Their manufacture was widespread in the East Greek region, and the output large. Overseas the Bird bowls were the most popular of East Greek wares, even appearing, though rarely, in Greek and other settlements in the western Mediterranean; a few imitations also have turned up in Sparta.

About the end of the 7th century B.C. the standard Bird bowl was replaced by cups of the same shape but of looser decoration and inferior technique. The new cups, which mostly display three large dot rosettes in the field between the handles, persisted far into the 6th century. A few cups, more carefully made, have a pair of eyes, and others solitary lotus flowers; there are also some degenerate compositions with the traditional birds. Rosette cups were exported less than Bird bowls and are almost unknown west of the Aegean.

*c. The transition to Orientalizing.* In East Greek vase painting the change from the Geometric to the Orientalizing style is, and perhaps will always be, obscure. Besides the Bird bowls, there are several pots from Rhodes and shards from various sites decorated in a weakening or affected Geometric tradition. Other, fairly numerous specimens (the best-known from Samos) exhibit Orientalizing ornaments, some freely experimental and some tamely correct. An oinochoe (Amsterdam, Allard Pierson Mus.) probably from Rhodes is, though unslipped, no longer Geometric in style. The shape and the cable of the neck anticipate the succeeding Orientalizing style, but the fish and ornaments on the body of the jug are perhaps better defined as sub-Geometric. There is more promise of later developments on some fragments from Samos and elsewhere that have misshapen volutes and palmettes. In the less common animal and human subjects, there is a trend to reserved details and outline heads; three examples will serve to characterize these tendencies. A large shard of a dinos from Ephesos shows part of a cavalcade (PL. 17). A fragment of a crater (krater) from Samos has a boldly reserved cable and a goat jumping over a dog (or a lion, if the scaly pattern on the creature's neck is meant as a mane). The vigorous invention of this Samian group contrasts with the feeble composition and execution of an oinochoe from Rhodes, with goats supporting themselves on arid arrangements of volutes and birds (probably cocks) of early Orientalizing type. Comparable fragments were found in the same Rhodian grave, and also (if the claims of excavators are credible) a Corinthian alabastron of the third quarter of the 7th century. Although it is rash to speculate about this stage of East Greek pottery on the basis of published evidence, it may be that there were various attempts to establish a standard Orientalizing style — in Samos, Smyrna, and other cities — and that Rhodes itself may have been backward.

The date of this phase is uncertain; however, if, as suggested below, the early "wild-goat" style was evolving about the middle of the 7th century B.C., the transitional period, which seems to have been short, may be assigned largely to the second quarter of that century. This dating implies that in the East Greek region the Geometric style persisted longer than in European Greece.

*d. Wild-goat style.* The principal form taken by the Orientalizing style of East Greek vase painting has been and is still called by various names. The oldest term is "Rhodian," since the first and best-known examples were found in Rhodes. Though still widely used, this name (like the obsolete "Milesian") can be confusing, particularly when it is necessary to distinguish what is properly Rhodian from the products of other places. "Camiran," which is perhaps less misleading, might have become established usage if the term "Kameiros group" had not been invented for a supposed stylistic division. "East Greek Orientalizing," which has also been proposed, is too general. It is safer to use the unambiguous and descriptive "wild-goat" style, cumbrous though it is; after all, wild goats are a characteristic and frequent species among the fauna decorating this ware. Opinions on the development and dating of the wild-goat style do not agree, and any account must be in part speculative. In this article it is presumed that the style was more or less uniform throughout the East Greek region and that it can usefully be divided into three successive stages — early, middle, and late.

The wild-goat style differs greatly in decoration, shape, and technique from the Geometric work preceding it. While some transition is apparent in the decoration, it is not yet clear whether it is correct to speak of an evolution. In any case, the interval between Geometric and wild-goat orthodoxy was probably short, and the two styles are sometimes juxtaposed on the same pot, as on fragments of fine craters from the Greek settlement at Al Mina in Syria and from Samos — indeed, the Orientalizing style of the Samian crater is very near the canon for the middle phase. Geometric shapes that survived include the broad, round-mouthed oinochoe and probably the crater. The broad oinochoe appears in the late Geometric (in Rhodes one workshop gave it a curiously angular belly), and development is toward a lower body. Craters of this period are too fragmentary for detailed study of profiles. Normally, the exposed surface of a pot is covered with a thick slip, ranging in color from a creamy yellow to white. Some very early and many late pots have a thin and washy slip, or even no slip at all. The clay below the slip is coarse and usually pink to light brown in color; a few unslipped pots are of a finer, more brownish clay. The paint is in the main dark to very dark brown, sometimes accidentally oxidized to red, and may also have a moderate sheen. The brushwork tends to be thick and careless.

The early stage of the wild-goat style is not well represented among published finds. One of the earliest examples is a broad oinochoe in Brussels (PL. 17). The panel on the shoulder contains two rams browsing on some spotty palmettes and on each side a goat rearing on its hind legs to nibble a branch or recoil from a snake; neat filler ornaments are disposed sparsely but effectively over the field. The composition is loose and unbalanced, the pose of the goats lively, and the drawing of anatomical detail tentative — for instance, in the head of the goat, where only the eye and a patch below it are reserved. Similarly, the choice and disposition of subsidiary ornament is still experimental. Another broad oinochoe, which has remained in Rhodes, appears slightly more advanced. Here two seated sphinxes confront each other across a large ornament composed of volutes and dotted palmettes. The filler motifs are placed more closely and skillfully; there is generally more facility in drawing, and the details of the figures, though not always logical, are bolder. From the end of this stage come such works as the crater in Samos mentioned above and the broad jug in Leningrad, The Hermitage, works in which the style has almost become conventional.

The wild-goat style is essentially an animal style, and in its early stage the animals are being standardized. The wild goat is evident from the beginning and grows in popularity; other creatures depicted are the dog, sphinx, griffin, goose, lion, panther, ram, bull, and hare. The head is normally outlined, with the eye and other necessary details drawn in. Reservation of the edge of the shoulder and the crossing of legs becomes regular, and toward the end the belly of goats and some other animals is lightened by a narrow reserved stripe. The poses become quieter, while composition tends more and more to antithetical tableaux and continuous processions, though on the Leningrad jug the goat on the shoulder turns its back on the central group, and on the belly one of the dogs has faced about to meet its quarry. The new conventional composition is assisted by the filler ornaments, which become closer and fluffier and acquire regular positions. Large ornaments of volutes and palmettes, which grow more compact, find their place in the middle of an antithetical grouping. There is increasing certainty in the subsidiary motifs, too; although checkerboard patterns are still frequent, the open cable has not yet given way to the canonical closed form, and tongues sometimes encircle the base on the pot.

The best-known early shape was the broad oinochoe, by this time in its heyday. The taller trefoil-mouthed oinochoe was only beginning its career, and the crater and dish do not seem to have been common yet. There were no cups. The wild-goat style, except in Chios, was very rarely used on drinking vessels of any kind, perhaps because its normal clay and slip would not provide a pleasing surface for the lips of the drinker; at any rate, this style offered no competition to the old-fashioned Bird bowls.

Dating is difficult for the wild-goat style. There is no series of graves to supply useful contexts, and stylistic comparison with other schools is hazardous. Yet the head of the sphinx on the Rhodes oinochoe is remarkably like proto-Attic heads of about 660 B.C., and this fact suggests that the early wild-goat style most likely did not begin before the mid-7th century. Moreover, the oinochoe in The Hermitage, Leningrad, has a hatched meander as the major decoration of the neck, and the fragment of a crater in Samos gives even greater emphasis to meanders of the same kind. From the meanders it may be argued that these two pots are not far removed in time from Geometric, and from their animal style that they are very near the middle wild-goat stage of about 625 B.C. There is also the context, already mentioned, in which transitional oinochoai are reported to have been found with a Corinthian alabastron of the third quarter of the 7th century. While the evidence is too scanty for certainty, it seems as if the early phase began little, if at all, before 650 B.C.; its end can be set with more confidence about 630 B.C.

For the middle stage of wild-goat pottery, the cemeteries of Kameiros and Ialysos in Rhodes have provided many oinochoai and dishes, whose style has a sober orthodoxy. An oinochoe in Munich (PL. 29) that looks as if it came from Rhodes is near the beginning of the middle stage. The decorative system is standard for the time: on the neck a narrow strip of cable pattern, on the shoulder a tongue pattern and an antithetical group of animals, round the belly a file of grazing goats, and below it a chain of large lotus flowers and buds. The drawing of the animals is neat and tame and their poses are limited. The filler ornaments are larger and recur in fixed places, as can be seen in the field of the belly, and half roundels and triangles regularly adhere to the frame. The lotus chain, characteristic of the middle stage, was adopted with no substantial change from Oriental models. The development of this style was toward quicker and coarser execution. The oinochoe became slimmer, with relatively shorter fields; at the same time, inspired perhaps by Corinth, some workshops stinted on labor by lengthening the bodies of their animals. In consequence, a group of three figures can fill the shoulder, and four goats are enough for the belly; the filler ornament — for example, the half roundels — is coarser and simpler, and the bands dividing the fields abandon the loop pattern inherited from the early stage and contract into a single narrow stripe. Sometimes the cable of the neck is replaced by an alternating pattern of meanders and squares, as in an oinochoe from Rhodes in the British Museum. Another group of oinochoai substitutes rays for the lotus chain below and reduces the decoration of the belly to a narrow band of simple ornament between broad bands of dark paint, as in the middle zone of a dish from Rhodes in the School of Art, Manchester (PL. 17). Dishes of this sort, with a tall stem like an old-fashioned fruit dish, complete the characteristic output of the wild-goat style of this time. In the outermost field, little panels contain rosettes and heads, birds, or even

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

a nose and a pair of eyes; these panels are separated by wedge-shaped rays, perhaps derived ultimately from the Egyptian papyrus. In the middle of the design is some suitable center-piece — in the Manchester example, lotus flowers and buds forming a simple cross.

The fauna of the middle style is less varied than before. On the belly the goat, grazing or occasionally running, is the favorite motif, sometimes replaced by the spotted deer; on the shoulder the regular groups are made up of goats, deer, sphinxes, griffins, and geese, and of lions, bulls, and boars. In the later phase, in which the animals are elongated, they are usually depicted resting or rising from the ground. An occasional variant theme is a file of geese. The poses are generally hackneyed, though for want of space one goat in a file may be smaller or contorted, while on the shoulder there are occasional whimsies such as a sphinx flattening a goose or, more prettily, a swallow perching on a rosette or tail. The griffins of the fragment from Samos and the Munich oinochoe cannot be far apart in date, as the filler ornament also suggests. The first example is represented walking stiffly and has a palmette on its forehead; the second, which has settled down, is content with a simple knob. The coloring, dark paint on a creamy clay, is heightened with a liberal addition of purple to relieve dark bands and the bodies of animals. Touches of white are rare, except for eyes and rosettes on the lips of oinochoai.

The old broad oinochoe scarcely continues into the middle wild-goat style, its place being taken by the taller oinochoe with trefoil mouth and short inward-sloping neck. A clumsier version of this new shape had appeared in the early stage, and progress in the middle stage was toward an even narrower body. Toward the end of this stage a squatter oinochoe appears, without rotelles and decorated only on the shoulder; the decoration is most often a panel between widely spaced rays, rather like that on the dish in Manchester. The amphora was very rare at this time, but craters and dinoi were more common than the complete specimens might suggest. Besides the stemmed dish, there is a ring-footed dish with broad rim and cutout grips; this ring-footed dish, arising toward the end of the stage, usually has floral ornament of simpler, more solid structure. The plate was still a rare form. In Chios a deep cup conventionally called a "chalice" was added to the repertory. In some of these shapes the influence of metal models can be seen, especially in handles; but imitation of a detail does not imply over-all imitation, and the use of rotelles (as also on some broad oinochoai) is in any case developed illogically, since in metalwork they are meant to clip onto the lip. The middle wild-goat style, at least in Rhodes, has been found in graves with examples of early ripe Corinthian; according to the chronology used here, it may be dated roughly from 630 to 600 B.C.

The late stage of the wild-goat ware differs from the middle stage in the character of its reserving style, its acceptance of the black-figure technique, and its shapes. The oinochoe from Rhodes in Copenhagen (PL. 18) is a fair example; here, as often, the new style occupies the upper and more honored field and the old continues below. The goat is now a boneless cartoon drawn with clumsy economy, exhibiting puffy jaw, tubular body, heavy rump, and rubbery legs. The pose, hardly recognizable as that of rising from the ground, is commonly repeated in continuous files and offers an easier alternative to the old formula of grazing. The filler ornament also is simplified: sets of strokes, spikes, or tongues sprout from the frame of the field, and a large double spiral is often inserted where there is room beneath the belly of animals. Where the reserving style persists on the shoulder, there is a wider choice of animals to supply the traditional antithetical groups; lions with a bull or boar are now more common. Of the larger ornaments the new cable, with heavy drops in its angles, appears on the neck of the Copenhagen oinochoe. The old outlined type of flower and bud disappears, and its place is usually taken by rays. But before the end of the middle stage, simpler floral forms in silhouette had appeared on the shoulders of some oinochoai; in the late stage, silhouette becomes the regular technique for the coarse flowers, buds, and palmettes now preferred. Although on pots such as the Rhodian oinochoe in Copenhagen the wild-goat style is still respectable, its thorough degradation is exhibited on other plates found in Rhodes. The following arrangement is typical: a deep exergue filled by radiating groups of tongues and, separated by a narrow strip of simple pattern, the main field with solitary animal and debased filler ornaments. Of these lone animals the sphinx is commonest, and next the dog; there are also the boar, bull, ram, griffin, lion, and even the Chimaera.

A few plates experiment with human figures (even scarcer as a motif on other shapes of the wild-goat style). The best-known, which may perhaps belong to the very end of the middle stage, is the Euphorbos plate in the British Museum (I, PL. 335). On a field encumbered by heavy filler ornaments Menelaos and Hektor fight over the body of Euphorbos; the flesh of the heroes is colored buff, and the inscriptions are in an alphabet which, so far as is known, must be that of Argos. The most valid explanation is still that of Johannes Boehlau: the painter of the plate copied figures and words from an Argive bronze plaque and filled in the field from his stock repertory. But the human figure remained outside the artistic experience of wild-goat vase painters, and their rare attempts to portray it are interesting chiefly as curiosities.

The black-figure style of this stage has a diseased vitality. The models, as some of the details show, were and continued to be Corinthian of the ripe style, the only influential black-figure school of the time. The filler ornament of the oinochoe in Copenhagen already mentioned remains that of the reserving style; but on other pots at least as early, wholly Corinthian rosettes are the rule. The drawing of black-figure animals varies from reasonably faithful copies of Corinthian to travesties in which, as in Italo-Corinthian, the incised details have no anatomical meaning or excuse. The lion of the Copenhagen oinochoe is of good quality, but the incision of its shoulder looks more like a collar; and there is a tendency, especially on sphinxes, to incise the buttocks with two arcs enclosing the base of the tail. The grouping is generally according to the Corinthian mode (mixed antithetical groups rather than homogeneous files), though the lions are more apt to lay a paw on their victims. The menagerie also is that of Corinth, with its lions, panthers, bulls, boars, goats, deer, sphinxes, griffins, swans, and sirens. This black-figure style seems in some workshops to have developed a more positive character and to have ventured into representation of human figures, but by the time of such development it can hardly be classed as wild-goat style. The subject has been neglected by students, partly because the remains are so fragmentary and partly perhaps from a laudable distaste, but it may have some importance for the subsequent East Greek schools.

The shapes of the late stage seem more varied than before, perhaps because the finds are from sanctuaries rather than graves. The new type of oinochoe has a higher, straighter neck and a lower belly, sometimes almost globular and sometimes oval, as in the Copenhagen example. There are also amphoras of the same general structure. The column crater is common, as are the dinos (PL. 18) and a low, open bowl like an overgrown Bird bowl; and lids are numerous. The dish continues, though often clumsier, and the plate is frequent, at least in the vicinity of Rhodes. Often the slip is washy and sometimes is omitted entirely. There is much use of purple, with less discretion than before, and some of white, especially for white and purple stripes on dividing bands or inside bowls. On the whole, the execution is clumsier and more hasty.

The dating of the late wild-goat style has not been settled. Its occurrence at Smyrna before that city was destroyed by Alyattes argues that it began before 600 B.C.; indeed, some examples seem to have connections with the earlier rather than the later phase of the middle style. But in Rhodes the middle stage is prevalent till the end of the early ripe Corinthian. Contexts for fixing the end of the late wild-goat style are insufficient, but about the middle of the 6th century other styles — Fikellura and Clazomenian — were well established. Perhaps the late stage extended from about 610 to 575 B.C., and the undefined black-figure groups that emerge from it fall mainly into the second quarter of the 6th century.

During its currency the wild-goat style was the customary local style for larger pots in the East Greek region, except for Lesbos and some other parts of Aeolis, where a gray ware (buchero), which was fired in a reducing atmosphere, dominated or was a strong competitor. Wild-goat ware was common, too, in the Greek settlements of Al Mina in Syria, Naukratis in Egypt, and the colonies round the Black Sea. Export to the west was negligible; not much has been found even in Delos; almost nothing in Greece and Italy, though in Sicily there are a few shards from Syracuse and Gela.

It is generally held that most of the Orientalizing motifs of Greek art came from or by way of Syria, and there is enough general (though not detailed) similarity between the Orientalizing borrowings of European and East Greek vase painting to allow acceptance of a single place of origin, though perhaps the models were in different media: the black-figure technique exploited by proto-Corinthian suggests engraving; the reserving wild-goat style has a textile look. But whatever their origins, the schools of the west and east Aegean developed differently. The wild-goat style did not adapt so readily and appears to have had little originality in itself; thus after the period of Oriental influence (which, judging by the lotuses and certain filler ornaments, lasted till about the beginning of the middle stage) it soon succumbed to the attraction of Corinth. The effect of the wild-goat style was no more than it merited. There may have been a little imitation in one or another of the Cyclades, and some kinship may be suspected with the school designated "Melian." At Sardis in Lydia, it has been claimed, modest derivatives have been found. In Phrygian pottery, animals in a reserving style may have been introduced earlier than their East Greek counterparts (see ASIA MINOR, WESTERN). Among later schools the Fikellura style retains the reserving technique and some motifs of its predecessor, while on Clazomenian sarcophagi of the late 6th and early 5th centuries B.C. the wild-goat style itself is drearily resurrected.

Although wild-goat pottery seems to have been generally uniform at any one time, there are noticeable differences among finds from Rhodes, Nisyros, Chios, and Larisa in Aeolis, the only places from which sufficient samples are available. Such differences probably indicate local manufacture. If so, the Rhodian school displays a correct, but rather tame and sluggish, expression of the style that seems to have been reluctant to adopt the black-figure technique, preferring the dry manner of the ordinary oinochoai of the middle phase. It is also likely that the debased reserving tradition of the late plates was a specialty of Rhodian workshops. Nisyros shows a provincial dependence on Rhodes, but the wild-goat style of Chios was more vigorous. In the Sciot (or Chiot) "chalice" in Würzburg (PL. 18), a not very distinguished work of the middle stage, the style differs from the norm of the Rhodian school in the reserved area on the body of the bull, the reserved patch at the back of the goose's head, the horseshoe roundel, and the continuity of the pendent ornaments above the bull. Other Sciot peculiarities are the whiteness of the slip and its use inside open pots as an undercoat for the dark paint. In the early 6th century B.C. Sciot vase painters pursued new directions of their own.

Larisa in Aeolis had a wild provincial school that had connections with the Sciot. Here forms often become more angular; lotus flowers sprout extra petals; incision and reservation are combined; scale, proportion, and fitness are forgotten; and shapes such as the kotyle-crater and ribbed bowls are in favor. Some pieces found at Smyrna recall Larisa, others Chios, and still others are more orthodox. What examples there are from Samos are closer to Rhodian work, though a little finer. A few excellent or merely peculiar fragments discovered elsewhere have been published but are probably untypical, if the finds from Al Mina and Naukratis provide a standard by which to judge. The present evidence suggests the existence of a southern and more orthodox branch of the wild-goat style, of which Rhodes was not the leading proponent, and a northern branch, in which Chios had some importance. Although it has been asserted that further divisions can be made according to the color and texture of the fired clay of various pots, the results are unconvincing. Further division of the wild-goat style must await the publication of more material from other East Greek sites.

There is no universally accepted classification of wild-goat pottery. The system used here emphasizes the unity of the style through three more or less successive stages. Another system, which is widely adopted, is that of Andreas Rumpf, who divides the material into two classes (1933) — the Kameiros group and the Euphorbos group, one corresponding roughly to what have here been called the early and middle stages, the other to the late. But these groups were, Rumpf claims, largely contemporaneous. W. Schiering later extracted a third class, the Vlastos group, from Rumpf's Euphorbos group, in which he leaves little more than the plates. According to Schiering, the Euphorbos group belonged to Rhodes and the nearby islands, but the other two groups were made throughout the East Greek region; all three lasted from the mid-7th to the mid-6th century B.C. None of these conflicting systems is wholly satisfactory, and perhaps all will prove wrong.

*e. Sciot ("Naucratite") styles.* Little of the pottery from Chios has been published, though more data may be expected as a result of excavation at Emborio. Nevertheless, tricks of style, shapes, and the use and color of the slip allow Sciot attributions for many pieces that have been found abroad. Even so, knowledge of the Sciot styles remains rudimentary.

The Geometric style of Chios seems to have had certain peculiarities. This style was followed by a competent wild-goat school, differing from the southern standard only in details, whose character became fairly distinct in the middle stage with shapes that suggest some degree of independence. The so-called "chalice," which became the most popular of Sciot exports, is well represented among finds; the example in Würzburg from Vulci (PL. 18), a work of the middle stage, appears to belong near the beginning of the evolution from the ordinary cup. Other known shapes that are decorated include the broad oinochoe, the dinos, the dish, and a big shallow bowl with slanting sides and with handles and plastic heads set vertically on the rim. There is also a reserving late wild-goat style of respectable quality; incision is still rare. Lotus flowers, buds, rosettes, and the like, painted in white and purple, begin to appear on the dark inner surface of open pots.

Early in the 6th century B.C., Sciot vase painters diverged further. The so-called "chalice style" grew out of the reserving late wild-goat style but tended to simpler and cleaner composition. The typical exterior decoration on chalices employs a single figure with little or no filler ornament; the inside, of course, is enlivened with white and purple embellishments. The most common subject is the sphinx, and there are also lions and human figures. The saw pattern between the handles is now a normal device. One further development led to more elaborate scenes of human action, in which nothing of the wild-goat style survived. On some of these paintings the rich coloring admits not only purple and white but also yellowish-brown dilute paint and a warmer brown for male flesh. Unfortunately, only fragments of these grander compositions have survived. The identifiable subjects include battles, horse races, chariots, processions of men and of women, and Herakles and the hydra. Some of the faces suggest Corinthian rather than East Greek models, and there appears to be borrowing of Laconian elements also. For the polychromy, paintings on walls and tablets seem the likeliest inspiration. The principal forms, so far as is known, were the chalice and the phiale; a few cups of more advanced shape have been observed, and there are also low-handled kantharoi, which have the white and purple ornaments within but are usually plain outside. The chalice style dates from near the beginning to about the middle of the 6th century, with the grander pieces belonging to the second quarter.

The chalice style is a reserving style. By the second quarter of the 6th century, however, some Sciot workshops offered a black-figure style as well, most of which has a uniform depravity — its stock subjects are komasts (that is, men reveling) and rows of recumbent sphinxes or of lions wearing frilly collars. Other creatures depicted include sirens, bulls, goats, centaurs, and riders. The filler ornament consists of incised rosettes and half rosettes, used like the roundels of the wild-goat style. Pur-

ple is added generously. Presumably the impulse for this black-figure ware also came from Corinth. Shapes that have been recognized are the pyxis with lid, stemmed dish, ring vase, phiale, and some jugs or tall pots. It seems that in shapes the chalice and black-figure styles supplemented each other. On some of these pots, especially on handles and rims, plastic heads are affixed (PL. 19); there is precedent for this practice in local products of the middle wild-goat style. A few black-figure pieces of this period are of much finer quality and are more ambitious in their subjects. Finally, about the middle of the 6th century, there appeared a modest but respectable black-figure style that dispensed with the use of slip; the chalice and the kantharos continued among its shapes. The clay varies from light brown to pink, and for chalices and other thin-walled pots its texture is fine. The very white slip appears on some pieces of the Geometric period and afterward is used regularly till the middle of the 6th century. This slip, contrary to normal Greek practice, was applied inside open vases, even though it was to be covered with dark paint.

Until the end of the 7th century B.C. the dating of Sciot pottery depends on stylistic comparisons, mostly with other East Greek wares. Later, there are a few useful graves and contexts for establishing synchronisms. Chios had the most successful of the archaic East Greek schools. While elsewhere, in the late 7th century and in the 6th century, local production was giving way to the competition of Corinthian and Attic wares, Sciot workshops seem to have held their domestic market. There was some export of Sciot pottery to sites around the Gulf of Smyrna, but very little to other parts of the East Greek region. In more distant regions, much Sciot ware has been found at Naukratis and at Berezan, some in other colonies round the Black Sea, at Al Mina, and in Aegina; in Greece and the west it is very rare. The Aeolian wild-goat school may have used models from Chios, and there was probably some Sciot influence on Clazomenian pottery and sarcophagi.

Sciot pottery was first noticed in 1884 at Naukratis and, naturally, was thought to be Naucratite. Though earlier phases of the school have since turned up in Chios, some students still maintain that there were "Sciot" workshops in Naukratis also during the first half of the 6th century. The main arguments are, first, that many simple pots found there display the name of the dedicator painted before firing and so must have been ordered on the spot and, second, that the fine polychrome style has not yet been discovered in Chios. On the other hand, some painted dedications have been found in Chios and even Aegina, the finds at Naukratis were abnormally numerous, and there are other classes of Greek pottery that have proved surprisingly rare in the place where they were made. The Sciot-Naucratite controversy may never be decided.

*f. Fikellura style.* The Fikellura style takes its title from a modern place name on the island of Rhodes. Some students prefer to call this ware Samian, supposing that Samos was its home; but the opinion is not proved, and there is other pottery with as good a right to that designation. Fikellura ware is most easily defined by secondary characteristics. The principal shapes and some of the ornaments are constant and hardly mistakable, and the technique is uniform; yet the style and system of decoration have a remarkable variety.

The style, which, although reserving, aims at the effect of black-figure, was established a little before the middle of the 6th century B.C. During the preceding generation a few scattered intimations were to be found in Samos and Rhodes on shards and pots dependent on the wild-goat style, and the so-called Ionian "Little Master" cups were a parallel phenomenon. The British Museum amphora from Tell Defenneh is one of the best-preserved examples of the first confident expression of the Fikellura style. On the lower part of the body were crescents and probably tongues; the principal decoration is the animal group on the shoulder. In the wild-goat style, heads had been drawn in outline and reserved details were thick. On this pot, in emulation of black-figure, the painter uses full silhouette with fine reserved lines. In the field there is a little light filler ornament of East Greek type. The dogs and hares chasing round the belly of the pot are in the same technique, but the drawing — even of the filler ornament — is coarser. The cable, normal in Fikellura, is derived from the wild-goat style, though closer to the middle form than to the late. The crescent motif is a Fikellura specialty. Purple is used in neat patches on the animals and on occasional tongues and crescents. Human and near-human figures, plump and mobile, also appear in this so-called "Lion group."

In the groups that follow, the animals are in general less carefully drawn and less frequent, human figures receive more attention, and decorative emphasis shifts from the shoulder to the belly. The amphora in Altenburg (PL. 19), which is perhaps twenty years later than that of the British Museum, uses much the same repertory of ornament, but the effect is concentrated on the drunken revelers, whose loose and animated poses compensate for the scant and hasty detail. Other amphoras of the Altenburg group have in the main field a single komast, animal, or bird between large volutes that start below the handle. The process is carried further in a large group of amphoras of the last forty years of the 6th century, where the volutes fill their field. The workmanship is sometimes very crude. Other related amphoras and amphoriskoi have a wide diagonal band decorated with dotted lines, crosses, and blobs.

There were, as well, some more imaginative painters. The Louvre group of oinochoai, perhaps a little later than the Lion group, departs from the ordinary schemes of decoration. The only complete example is a vase from Rhodes in the Louvre (PL. 19) that seems to have been conceived by its painter as a sort of bird, with scales for the plumage on the breast and oblique strokes for the wing feathers. On the shoulder, at the front, is a row of simple but neatly drawn swans. The pattern on the neck is unusually involved, while inside the lip are small lotus flowers and buds drawn in white on a dark ground. Fragments of similar oinochoai have animals and even human figures in the front panel, and a neck in The Hermitage, Leningrad, displays a large female head facing a floral ornament and, beyond it, presumably another head.

There was a more healthy interest in blank space, which in the right setting can be as impressive as decoration. A group of plain-bodied oinochoai, reckoned as Fikellura rather than wild-goat style because of their ornaments, seems generally earlier than the Lion group. On these oinochoai the decoration is limited to tongues and largish ornaments on the shoulder and very short rays around the base. There appears to be no direct connection between such oinochoai and the Würzburg group of amphoras, which was also the product of a single workshop. On the shoulder there is usually a dog chasing a hare, deer, or goat, or else a row of birds. The drawing of the animals, which are derived from the Lion group, is cursory; that of the birds, worse. The belly is divided into three bands of much the same depth. The topmost has a careless open cable; the lowest, crescents; and the middle one is void. In other amphoras of this group, which is dated toward the end of the third quarter of the 6th century, the middle band is filled with crescents.

Connected with the Würzburg amphora group by the type of dog and the general coarseness of line is the Running Man group, also the work of one shop, if not of one painter. The amphora from Rhodes in the University of Birmingham (England) is a mediocre example: the neck is hastily filled with a rough meander cross; at the top of the shoulder is a chain of pomegranates, each reduced to a blob and a stroke; on the body a hare decorates each face, and a simple bold ornament each side; even the regulation strokes on lip and handles are sparse. The shape also, perhaps deliberately, is negligent — in the Birmingham example, the mouth and shoulder were pushed in when the handles were attached. The amount of labor spent on painting this pot was remarkably small, but the bold and well-conceived simplicity of the design does not require precision of detail. The spirit of the Running Man Painter is very different from that of his Attic or even some of his Fikellura contemporaries. Other subjects on these amphoras include men and dogs, drawn with a strong feeling for move-

ment and little for anatomy. The date of this group is probably much the same as that of the Würzburg group.

Mention has been made of a group of amphoras decorated with a zone of large volutes (cf. PL. 6, lower right), among which is included an example from Rhodes in Athens (Nat. Mus. no. 14625). Another group, some examples of which were painted by the same hand as this amphora, has a band of ornament on the shoulder and volutes as the sole decoration on the belly. It is likely that the idea of the free field derives from the Running Man group.

All these groups, except for the early Lion group, are rather coarse or cursory in their drawing; yet a fine and delicate style continues on a number of miscellaneous shards and pots, especially in the representation of human figures and monsters. An example of this finer drawing is provided on an amphoriskos from Rhodes (ca. 520 B.C.): on one side Ares stands stiffly in full armor; on the other, Dionysos reclines in space, with a drinking horn to his lips. More elaborate is a large cup found in Samos and of rather earlier date. Inside is a gorgoneion at the center, around it a flight of Boreads and a school of dolphins, and on the lip (so it seems) birds. The outside is as busy, with tongues around the foot, volutes, and diminutive komasts, and on the lip, volutes and buds. Besides purple a little white is used, and details are incised.

Other pieces, from the late third and the early fourth quarter of the 6th century B.C., offer fine heads of Busiris and satyrs; they are, of course, depicted in profile, but the farther half of the satyrs' moustaches is twisted forward into view. Of scenes with human figures, drunken revels are the most common; the Altenburg amphora (PL. 19), though the style is rather coarse, gives a fair notion of the poses, lively and unstandardized. Shards in the Fitzwilliam Museum in Cambridge (England) of much the same date and quality include a pickaback incident. On a fragment from the Lion group there may be a "Lady of the Beasts," or Potnia Theron (Πότνια Θηρῶν), with attendant nymphs and winged figures. A battle of cranes and pygmies is a rather later work. Busiris, if the serpent he wears is sufficient identification, appears on a small fragment from Naukratis. Satyrs have their turn, on a fine late piece, chasing maenads. Centaurs and armed men are represented on other shards from Istria. Where the decorative scheme allows only a single figure, there is still a wide variety: the Altenburg Painter uses komasts; the Running Man Painter has what looks like a parody of a sprinter from a Panathenaic amphora and a hare-headed man who might be a transformed companion of Odysseus; Ares and Dionysos contrast neatly on the amphoriskos from Rhodes. It is less easy to explain, as an excerpt from a larger scene, the winged dog-headed man with a sword who appears on a shard from Berezan. Though Fikellura painters probably took account of developments in Attic black-figure, they did not feel bound by its conventions. Perhaps the chiton of Dionysos on the Rhodes amphoriskos is drawn in outline as a substitute for white paint, but there is no explaining away the use of dark paint for the flesh of women as well as men. The plump fluidity of the more finely drawn figures is essentially East Greek, and the type of head can be traced back to the sphinxes of the middle wild-goat style. On coarser work the forms are often more spare.

The animals are the familiar set: sphinx, griffin, lion, panther, bull, and boar are early; dog, hare, goat, deer, and various kinds of birds continue longer. On a unique cup from Samos there are dolphins. The partridge, with its striped belly, is the most striking of the birds. Some geese have interior markings reminiscent of the wild-goat style, while others are in silhouette. The few swans and cranes are more carefully executed. The floral and abstract ornaments are most varied in the earliest groups of Fikellura. On necks the regular decoration consists of cable (e.g., Altenburg amphora; PL. 19), meander and square, or the meander cross. The ivy leaf becomes common for narrow bands on shoulders, crescents are very frequent for bands around the belly, and lotus flowers and buds are another staple (also evident in the Altenburg amphora). Diagonal decoration was found especially convenient for decorating cheap amphoriskoi, and large-sized volutes become the principal decorative feature of many amphoras. A special type of ornament is exploited below the handles in the Running Man group. Most of these ornaments have antecedents in the wild-goat style, though in Fikellura they assume new forms (e.g., cable and lotus) or new importance (e.g., volutes and handle ornaments). But crescents, the meander cross, and diagonal arrangements are innovations of the style.

The standard Fikellura shape was the amphora, which had a few predecessors in the middle wild-goat style. At the beginning of its development, there were some oinochoai and simple cups of East Greek types. Later the amphoriskos, developed from the amphora, became common. The technique is that of the earlier wild-goat style: coarse clay, brown to pink in color; creamy slip; dark and not very shiny paint; and reservation of detail. Incision is an exceptional device (that on the loin cloths of the Altenburg amphora is modern). Purple is common on the more painstaking work, but white is rare. The less careful groups of Fikellura ware are fairly well dated by graves in Rhodes, but the finer groups and pieces depend on stylistic comparisons that are not close enough to be decisive. The Lion group probably begins about 560 B.C., though the plain-bodied oinochoai go back farther. The end of the Fikellura style must be about 500 B.C.

In its early stage, the Fikellura style had some close connections with the Ionian Little Master cups and presumably gave the crescent to Clazomenian black-figure, but its further influence was negligible. Distribution is normal; in the southern part of the East Greek region, from Rhodes to Samos, Fikellura was the main local ware, though less frequent than imported Attic; it was common at Greek sites in Egypt and around the Black Sea; there are several specimens from Delos; elsewhere it is very rare.

Where Fikellura was produced has not yet been determined. Most of the East Greek finds come from Rhodes and Samos — those from Rhodes are generally coarse in style, those from Samos fine. The amphoriskos with Dionysos is awkward, since, though of excellent quality, it was found in Rhodes and is closely related to more humble pieces also found there. More serious difficulties are the lack of information from other East Greek sites and the disparity between the contents of graves (the chief source for Rhodes) and the offerings in a rich sanctuary such as that of Hera in Samos. On balance it seems likely that there were Rhodian workshops, probably few in number, that made coarser Fikellura ware and some Samian workshops producing fine pieces. Whether it was also made in Miletos or other cities is not known.

*g. Ionian Little Master cups.* The most accomplished products of East Greek pottery are the so-called Ionian "Little Master" cups, which represent an attempt to emulate and surpass the fine products of Attic workshops. The shapes, color, and quality of clay and paint, as well as the technique, obviously imitate Attic, but the style and disposition of the decoration is in part (it seems) novel. Little of this class remains except small shards; few though they are, their variety is remarkable. These employ both reservation and incision of detail, some of it minutely fine. On the outside of the lip the decoration is more extensive than is usual on Attic lip cups. The strip between the handles also may receive figures, and the inside rejects Attic sobriety. On the simpler pieces fine horizontal lines in dilute paint may encircle the lip or bowl. There are some close stylistic resemblances to Fikellura, most obvious on the earlier pieces that reserve details similarly (PL. 20; note the man). Minor similarities are the ivy and myrtle chains, frequent on the lips of these cups. Presumably the Ionian Little Masters developed in the same surroundings as the early painters of Fikellura, and even when they adopted the more versatile technique of incision, connections can still be observed. There is also, of course, influence from Attic. But it is easier to admire than to analyze.

The remains of these cups are too few and fragmentary to allow neat conclusions about their artistic character and classification, but it seems that these East Greek miniaturists, in spite of their skill and delicacy, were too wayward to establish

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

a coherent style. The inside of the cup in the Louvre is instructive and unique. The decoration consists essentially of foliage, loosely intertwined, and though the artist concedes two tree trunks, a man, and some small wildlife, he does not try to give logic to his composition — there is no top or bottom to the scene, nor is the man engaged in it. The informal charm of this design contrasts with the disciplined imagination of the picture by Exekias of Dionysos at sea (V, PL. 185). Since these cups have been found principally in Samos and Naukratis but not in Rhodes, it is probable that they were made in Samos, or at least in Ionia. Their date, which depends on stylistic comparison with Attic and Fikellura, appears to be from about 560 to 525 B.C.

*h. Clazomenian and other East Greek black-figure.* By the middle of the 6th century B.C., several northern East Greek workshops were producing pottery in a modest black-figure style with human figures. Very little is known about these workshops, for their markets generally seem to have been local, and of the relevant sites only Smyrna has been explored satisfactorily, though the results have not yet been published. Meanwhile, there are a few shards from Naukratis, usually and wrongly ascribed to the Clazomenian school. Further excavation in northern Ionia is likely to show that East Greek black-figure was more complex and interesting than has been supposed, but hardly more important for the development of Greek art.

The one East Greek school of black-figure which was much exported is that known as "Clazomenian." The attribution of this school to Klazomenai, on the southern shore of the Gulf of Smyrna, cannot be far wrong: in the East Greek region the main finding places (as of the related Clazomenian sarcophagi) have been Klazomenai and Smyrna — and Smyrna was at the time in question more a village than a town. Clazomenian black-figure becomes a recognizable style about the middle of the 6th century. The earliest group, so it appears at present, is a loosely related assortment of large pots. On the amphora, which may be taken as the most typical shape, the main field occupies a large part of the belly and usually shows a file of women, grasping wrists in a dance. On the neck and shoulder, and sometimes below the main field, there are groups or rows of animals or other creatures, occasionally separated by a large ornament composed of lotus flowers and palmettes. Of the fauna the most frequent are sirens and sphinxes, and the most notable are cranes, which are sometimes white. Occasionally human figures perform on the shoulder. Crescents in white (or alternately white and purple) on a dark band regularly underline the shoulder, with other lesser ornaments filling the rest of the visible surface of the pot. Incision, sometimes scratchy, is used for linear detail on dark surfaces; on the white of female flesh or cranes the detail is more often painted. The clay is brown, rather paler than Attic, and the dark paint is shiny. Slip is rarely added. The standard amphora of this Tübingen group of early Clazomenian ware is large and broad, with handles set on the shoulder and often flanked by plastic female heads. Other shapes include the crater and a large lidded bowl or pyxis.

The influences evident in the style of the Tübingen group are largely East Greek, particularly (so it seems) Sciot. These sources provide precedents for the dancing women, their tight dress, the shelving type of face, the popularity of sirens and sphinxes, the shapes of the pots, and the plastic heads. Crescents are presumably borrowed from the Fikellura style, though the technique is rather that used inside Sciot chalices and phialai; the few other resemblances to Fikellura are probably collateral. Attic models are discernible from the first in the lotus-palmette crosses, some of the birds, the rows of white dots, and better comprehension of the black-figure style. On the late amphora in Tübingen the faces of the women, too, have taken on an Attic look; the date of this group may be about 550–540 B.C.

The Petrie group, which in time probably overlaps the Tübingen group, is more compact and may be the work of a single painter. Its characteristic shape is a very narrow amphora with handles reaching from shoulder to neck. Usually the neck has a siren or a sphinx on each side; the two big panels on the body display human figures; and below, separated by a strip of simple ornament, are sirens, sphinxes, birds, or mixed animals. The work of the Petrie Painter is very uneven: on an amphora in the British Museum the satyr stalking a pair of maenads is a vigorous creation, and the sphinx at least rugged; in other works he is so careless as to be petty. The favorite subject of these amphoras is a tame procession of cloaked women (PL. 30). Next come satyrs and their companions, and there are also a battle, a youth riding, a mixed procession, and bearded komasts. While the Petrie Painter owes much to Attic models in his human figures, animals, and technique, he had a personality of his own. It is by chance that his style is known so well; most of his extant works come from the small and abnormal deposit at Tell Defenneh and were probably made between 540 and 530 B.C.

The Urla group, consisting mainly of broad amphoras and hydrias, is rather later. The system of decoration has become even simpler. The hydria from Tell Defenneh (PL. 22) has a large panel on the body and a minor field on the shoulder, so that the main field runs up to its top; in compensation the neck is adorned with a weary palmette. The chief subjects are dancing women, cloaked women, satyrs and maenads, and komasts; in addition, there are Odysseus and Circe, perhaps Oedipus and the Sphinx, riders, and chariots. For the shoulder of hydrias, sirens are the usual motif. Subsidiary ornament is negligible. The style is generally poor; on the Tell Defenneh hydria, one of the better examples, the stock sirens have an insipid prettiness, but the more ambitious encounter of satyrs and maenads is drawn with clumsy stiffness. The Urla group develops from the Tübingen group, with some borrowing from the Petrie Painter and from Attic, as in the shape of its amphoras and hydrias. Its date seems to be about 540–525 B.C.

These three groups do not comprise the whole of Clazomenian black-figure work. Of the remaining examples, some pieces are stylistically comparable to the Urla group, but a few are more distinguished. The fragments, perhaps of a hydria, in Brussels (Musée Royaux d'Art et d'Histoire, no. 931) and in Athens (PL. 22), though anatomically weak, have an attractive liveliness of action and gesture. On the shoulder Achilles mounts his chariot, beneath which he has tied the body of Hektor; below, a seated pair receive a visit. As on some other Clazomenian pieces, the artist uses white instead of dark paint for male flesh. There are also a number of East Greek black-figure pots and shards that are more or less closely connected with Clazomenian; of these only the Knipovitch class is obviously coherent. Its typical shape is an amphora with concave lip and sagging body, on which the usual decoration is the forepart of a winged horse or scales. This class perhaps belongs to the period 540–510 B.C.

The known places where Clazomenian black-figure pottery has been found are Klazomenai and Smyrna, Tell Defenneh and Naukratis. There is a little from other sites in Egypt. Elsewhere it is very rare. The Knipovitch class and related work are infrequent in northern Ionia but appear in Delos, Egypt, and the Greek colonies of southern Russia. For chronology Tell Defenneh is important, if the Greek pottery found there stopped with the Persian conquest of Egypt in 525 B.C.; otherwise, dating is by style.

*i. The East Greek situlae.* The most curious class of East Greek pottery bears the neutral name "situlae." A group of squatter jars with very simple ornaments on the upper part of the body, observed at Vroulia in Rhodes, seems to be a humble forerunner. The black-figure situlae fall into two groups. The earlier is represented by a situla from Memphis (Philadelphia, Univ. Mus.); the lower part, correctly restored, should be thought of as painted dark except for another set of reserved bands. The clear brownish clay and shiny dark paint recall the Bird bowls. On the other side of this pot a pair of dispirited bulls occupy the wide, undivided field. Purple is used to pick out details, but not white. Other situlae of this group offer as decoration "Typhon," a "Boread," a griffin, and a lion with an

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

owl. The style of the figures has parellels in Attic, Corinthian, and Fikellura. The side ornaments of the Philadelphia situla are of a structure peculiar to this group, which is probably the work of a single painter.

The later group of black-figure situlae is larger. Its clay is paler, and both it and the paint have worn badly. The shape is usually slimmer and more elegant, with shorter ring handles. The decoration of the body is still in three bands, but the lower two are now filled with large lotus flowers and palmettes, incised on the dark ground and enlivened with purple (as on the Vroulian cups). In one instance this technique is used in the panels between the handles, but normally these panels (no longer divided or bordered) contain a solitary figure or simple antithetical group drawn in a black-figure style with much addition of purple. The style varies greatly in character and execution. Nor is there a consistent connection with any other school: the plump head of the "Boread" on one of these fragments resembles those of some Caeretan hydrias; the horse of another, those of the Siphnian Treasury at Delphi; and other situlae exhibit different types. Some of the subjects, too, are strange — one shard appears to have the peculiarly Egyptian motif of a falcon on a Neb basket. In spite of similarity in shape, technique, and decorative system, this group of situlae has no stylistic coherence.

Where the situlae were made is not known. Since the simple preliminary group has been found only in Rhodes, it was presumably of local manufacture. The earlier black-figure group numbers only four or five examples: one from Rhodes, two from Tell Defenneh, and one from Memphis. Of the thirty-odd later situlae, two poor specimens are from Rhodes and the rest from Tell Defenneh. This distribution argues that the later group was not made in Rhodes; otherwise, more would have been found in that well-explored island, export would not have been restricted to Tell Defenneh, and the style would be less wayward. Perhaps this is a rare instance of Greek potters working in an alien land, isolated in the eastern part of the Egyptian delta. On the home of the earlier black-figure group, which differs in clay as well as style, available evidence makes it hardly worth speculating. For the date of the situlae, Tell Defenneh perhaps suggests a terminal point of about 525 B.C., and something may be guessed from stylistic parallels. On the basis of such evidence, the first black-figure group falls in the second quarter of the 6th century and must be one of the earlier East Greek schools that can properly be called "black-figure." The later group, in so far as it comes from Tell Defenneh, should belong to the third quarter of the century, though it seems to have continued later — at least two degenerate pieces found in Rhodes were both in contexts of 500–490 B.C.

*j. Vroulian style.* Vroulian is another of the groups of Greek pottery in which the field is covered with dark paint and decoration executed in incision and added color. The style takes its name from the modern site of Vroulia at the south end of Rhodes, where specimens have been found. The main group consists entirely of cups. The shape, which varies little, is old-fashioned for its period; so, until excavators' contexts were noted, Vroulian ware was usually dated too early. The decoration, large and simple, covers most of the outside; the inside sometimes has a large star, at other times ornaments like those of the exterior. The underside of the foot is reserved. The principal motif is the enclosed palmette, and there are also free palmettes, lotus flowers and buds, and rosettes. The lip is usually filled with a large zigzag. In the band between the handles, there are often pairs of opposed triangles and vertical strokes on a reserved ground. The clay is fine and brown, the dark paint has some sheen, and the execution is neat; purple is the only added color. On the evidence of graves in Rhodes, it appears that these cups were current from the beginning till after the middle of the 6th century B.C. They were probably made in Rhodes, since most known examples were found there or at Naukratis.

Besides the Vroulian cups a few amphoras and fragments of a hydria, open bowls, and deep jars (sometimes called "stamnoi") are decorated in a Vroulian manner. On these large pots the technique is coarser. The decoration is usually in two or three deep bands, separated by reserved stripes, and the regular ornaments are lotus flower and bud and the palmette. The later situlae, too, use this system for their lower fields.

*Clazomenian sarcophagi.* Burial in coffins of stone or terra cotta was a widespread practice in East Greek communities in the 6th century B.C. Most of these coffins were simple and undecorated, but in Klazomenai and Smyrna and possibly in other places nearby, there arose a fashion for something more imposing. These Clazomenian sarcophagi normally have a rectangular or trapezoidal receptacle with a broadened rim that has painted decoration on its face and edges. A few more elaborate pieces have paneled sides and a lid, also decorated. The material is a coarse reddish or brownish clay coated with a thick creamy slip on the parts to be painted. The decorative system of the face of the standard sarcophagus (PLS. 22, 23) provides a deep field at the head, sometimes bordered by one or more subsidiary bands. A strip of ornaments or black-figure animals runs across from the projecting inner corners, and below is a squarish panel, occasionally emphasized by a narrow band at top and bottom. Down the side there usually runs a long cable with palmettes in its angles. At the foot the arrangement of the upper part is reversed, but subsidiary bands are fewer. Along the outer edge there is often a large egg-and-dart pattern, and on the inside some sort of meander. For the drawing of the figural decoration there is a choice of three manners. First, there is a variety of the old wild-goat style, in which the heads and other details of the animals are roughly reserved. Second, there is a kind of black-figure style. In this style, presumably because of the coarseness of the slip, the inner details are not incised in the silhouette but are drawn in white paint, though these touches and the lavish patches of purple have generally perished. The black-figure style is used for human and superhuman scenes and for the conventional animals of subsidiary bands. Of these two manners, the black-figure has precedence, and where both are used on the same sarcophagus, black-figure takes the headpiece and upper panels, while the foot is left to the wild-goat style. But often the wild-goat style is found alone on later as well as on earlier works; it was a quicker and therefore a cheaper technique. The third manner, which is rare and tentative, imitates red-figure by reserving its figures and filling in the background with black. More common is the related practice, confined to side panels, of drawing heads in outline on a reserved ground.

The wild-goat style of the sarcophagi has little merit. There is some feeble elegance in an early example in Istanbul (Archaeol. Mus., no. 1427), but more often the figures are heavy, and sometimes clumsy and inept. In the main fields the standard group is a lion and a so-called "panther" (which is simply a lion turning its face to the spectator) flanking a bull, boar, or goat. Other creatures are sphinxes, and sirens, and in early works geese and spotted deer. The filler ornament, thick and coarse, is partly traditional, partly peculiar to the sarcophagi.

The black-figure style is at least more competent. Individual figures of men and divinities, horses, and dogs are often drawn with a neat correctness of outline and inner detail, but the composition is as senseless as it is symmetrical. The early sarcophagi show a little thought, if not invention, but in the Albertinum group stock figures and poses are established, and these are repeated and recombined to fill the field rather than to tell a story. For example, on a sarcophagus in Berlin (Staat. Mus., no. 3145), the center of the headpiece presents a crouching archer, attacked from each side by a hoplite. This vigorous group is flanked by two more hoplites, passively looking on. Beyond them a winged female figure, grasping a spear, briskly mounts a chariot. A naked boy acts as charioteer, intently holding the reins of the spirited pair of horses. Beside the horses and filling the space above and below their bodies is another standing hoplite, who turns his head back to bind the group together, while in front a dog tries to attract his attention. It is tempting but futile to look for a meaning in this composition, or even within its component groups; the painter's aim is decorative. Perhaps this is why female flesh is never colored white, for the contrast would be un-

settling, In the panels on the sides, in which two hoplites fight over a fallen man, it is revealing to note the detailed similarity of the groups. The outline heads that appear in some panels are undistinguished, but since their detail is painted directly on the slip, it has often survived and offers obvious clues for dating.

Since these sarcophagi were made solely to be buried, it is not surprising that, although discovery has mostly been casual, more than 130 examples are known. Their chief interest lies in dissection of the decorative repertory of their painters. Their wild-goat style is evidently descended from that current in East Greek vase painting. In some early examples the connection is still fairly close, but there seems to be a gap of a generation or more between the last pots with a reserving wild-goat style and the earliest-known sarcophagi. If so, the tradition must have survived, and evolved a little, in some perishable medium — probably textiles. It is a salutary reminder of Greek conservatism that this dull and outmoded style persisted till the end of the series of Clazomenian sarcophagi, at a time when the classical style was already maturing. The black-figure style, for all its slickness, is also derivative. On the headpiece, previously mentioned, of the Istanbul sarcophagus, the soldiers have some kinship with those on a Clazomenian amphora by the Petrie Painter; but generally the style and types are adapted from Attic vase pointing, and even the Petrie Painter shows strong Attic influence. The outline heads, too, reflect Attic models.

Dating is by style, since only one late sarcophagus has an intelligible context. The first group is that of the Borelli Painter; if the Petrie Painter has been dated correctly, the younger Borelli Painter may be put roughly between 525 and 510 B.C. (The one obviously earlier sarcophagus should not be much earlier.) In these works a northern Ionic influence is visible. By the time of the Albertinum group, the black-figure style is more fully Attic and the wild-goat style has lost its local flavor. To judge by the number of specimens and by such details as the open eye of some outline and black-figure heads, the period of the Albertinum group was from about 500 to 470 B.C. The Hopkinson Painter is a successor, active in the 460s; of his few surviving works the majority come from Rhodes, but it does not follow that he worked there. There are, besides, a number of unattributed and inferior sarcophagi, some of which may be a little later.

*East Greek workshops abroad.* It was at one time fashionable to recognize the handiwork of East Greek vase painters and their pupils in the products of many schools throughout the Greek world. Such indiscriminate attribution has in general been corrected, but a few such relationships still seem possible. In Egypt, the East Greek situlae may have been made in the neighborhood of Tell Defenneh; there are a few oddities so provincial that they may be Egyptian Greek, and some specialists maintain that part of what has here been called "Sciot" came from Sciot workshops in Naukratis. In Etruria Greek art was admired and imitated, though certainly East Greek imports are rare. Pontic and later Etruscan black-figure wares were based largely on Attic models; the most credible of East Greek attributions is the partridge with its strikingly barred breast. The more likely claimants among Etruscan finds are the Northampton group, the Campana dinoi, and the Caeretan hydrias.

The Northampton group, small and of fine quality, belongs to the late third quarter of the 6th century. While it owes much to Attic products, it is certainly not Attic itself. Moreover, though part of its repertory is paralleled in East Greek art, the parallel elements come from various schools and by this time were mostly naturalized in Etruscan art. That the Northampton Painter was a Greek is likely enough, but he may well have been a Greek who settled in Etruria and formed his style there. To what degree that style is East Greek remains a matter of opinion.

The Campana group of dinoi is of slightly later date, and its quality is inferior. Compared with the Northampton group, its East Greek connections are more pronounced, but so are its Etruscan connections. Again, manufacture in Etruria is likely, and an East Greek immigrant, partly Etruscanized, may have been the originator of the group. Very close to the Campana group is an amphora loosely related to Clazomenian ware and bought in Karnak; though this provenance is suspicious, the pot was probably found in Egypt or the eastern Mediterranean region. This amphora may, as some assert, be painted by the same hand that made some of the Campana dinoi. If so, this work provides the only direct evidence of a painter who started his career in the Aegean area and continued it in Italy.

The Caeretan hydrias are the production of one painter and perhaps a pupil. The style of this painter, who wrote in Ionic Greek, has affinities with East Greek, European Greek, and Etruscan schools. Furthermore, most of these hydrias were found in Etruria, and none certainly were found elsewhere. It is probable that his workshop was in Etruria — more precisely, at Caere (mod. Cerveteri) — and that, if he was an immigrant from Greek Asia, it was in Etruria that he formed his artistic personality.

R. M. Cook

The influence of East Greek vase painting in Etruria was important not only for local production of pottery but perhaps also for decorative painting on a larger scale, being reflected in such media as the painted terra-cotta plaques from Caere and wall paintings of tombs, particularly those of Tarquinia. Imitation of the Sciot style has been suggested, for instance, for the Boccanera plaques in the British Museum (Rumpf, MZ, p. 46). It is possible that East Greek influence in Etruscan painting might also have been effected in other ways, perhaps even from East Greek painters active in Italy. In that case it would be justifiable to recognize in many elements of composition, style, and technique of Etruscan wall painting an indirect reflection of lost originals of East Greek monumental painting. Traces of such painting exist elsewhere, as in the fragments of wall paintings found at Gordion (Gordium), in the interior of Anatolia (I, PL. 366).

Artists and bibliog. (*Painters*). *Klazomenai.* Boularchos (Βούλαρχος), thought to be from Klazomenai or at least Ionian; active second half of 8th cent. B.C.; author of treatise on painting: painted battle scene acquired by King Kandaules (Rumpf, MZ, p. 28; L. Guerrini, EAA, s.v.). – *Kolophon.* Diores (Διῶρης), archaic period (L. Forti, AEA s.v.), perhaps to be identified with Dionysios (Διονύσιος) of Kolophon; lived ca. mid-5th cent. B.C.; thought to have executed wall paintings and also a figure possibly corresponding to another by Mikon (or Kimon ?; Pfuhl, II, p. 648; G. Cressedi, EAA, s.v. Dionysios, no. 2). – *Samos.* Mandroklees, also an architect (see below under *Architects*). – Kalliphon (Καλλιφων) of Samos, active 6th or 5th cent. B.C. in Ephesos: Battle by the Ships, illustrating an episode from Homer, in the Artemision at Ephesos (Pfuhl, I, p. 499; ThB, s.v.). – Pythagoras (Πυθαγόρας) of Samos (or Rhegion), sculptor who was a painter in his youth (see GREEK ART, WESTERN). – *Ephesos.* Kalliphon (see above under *Samos*). – *Naukratis.* Philokles (Φιλόκλης) of Naukratis, active mid-7th cent. B.C.; considered the inventor or one of the originators of linear painting (ThB, s.v.; G. Lippold, RE, s.v., no. 9).

* *

Sculpture. Two battered series from Samos and from Branchidai, near Miletos (the first series of good, the second of poor, quality), fragments of the decoration of the Temple of Artemis at Ephesos, and a few isolated finds from other sites are all that remain of East Greek sculpture.

The Geometric period had no monumental sculpture, if one may judge by the figurines, frequent especially at Samos. There are traces of a Daedalic style in the 7th century B.C. in a fragmentary large statue found in Samos, though seemingly of Naxian marble, and in some terra cottas. The Daedalic style flourished most vigorously in the Peloponnesos, and the claim occasionally made that it originated in the East Greek region is unlikely. If the finds are representative, a distinctively East Greek style first emerged about the end of the 7th century. The peculiarity of this style is a preoccupation with full rounded surfaces and the consequent neglect of the structure of the human body. The comparison with the 6th-century style of European Greece is striking. The European sculptor appears to concentrate on the anatomy of bone and muscle;

his East Greek contemporary prefers the sleek undulation of fat and the tricky folds of clothing. Although the naked kouros is popular in East Greek statuary, it is not surprising that draped figures are more common. Besides the kore, other types are the standing man, the seated man or woman, and even the banqueter reclining on one elbow.

The marble statue dedicated to Hera of Samos by Cheramyes (I, PL. 356) is the best example of a trend evident about the 560s at other places as well. It is a work that impresses by its solidity and clever detail. The lower part of the figure, unnaturally elongated, rises like a tree trunk; above, there is a suggestion of the protuberance of the belly and breasts, and the back is broadly hollowed. But the sculptor's main interest is in the drapery and the contrasting, though shallow, folds of different garments; especially noteworthy is the system of intersecting folds at the base of the chest. The Hera of Cheramyes has lost her head, but its type may be conjectured from the upper part of a similar statue found in Athens (Acropolis Mus., no. 677), a work of Naxian marble closely related to the colossal sphinx dedicated by the Naxians at Delphi; its big, heavy face has an affinity to some undoubtedly East Greek bronzes and terra cottas. Whether this trend began in Naxos or, as is usually supposed, in Samos cannot yet be decided. But the close, shallow folds of drapery persist in sculpture found, and so presumably made, in Samos. A good example is the figure of Philippe from a marble group made about 560 B.C. by Geneleos (PL. 24). Here the folds of the dress are simpler in detail and the general effect more charming; the hand clutching a piece of skirt and pulling it to one side is an intimation of a new development in Greek sculpture.

The statues of Geneleos also are headless; however, it is hard to imagine them with heads as solid as that of the Acropolis statue just mentioned (no. 677). The typical East Greek face is smaller and more plump. One of the earliest examples of these qualities, from the beginning of the 6th century, is the ivory figurine from Ephesos in the Archaeological Museum in Istanbul, which originally supported a long pole crowned with a hawk. An evolutionary relation between this and the Daedalic conception of humanity appears improbable, and it may be that there is here a new and direct influence of Oriental models. Such influence might also explain the taste for seated figures and the clutching of their skirts by korai, a motif that in some early examples resembles a transference to draped figures of the pudic gesture of Oriental nude goddesses.

At Branchidai (or Didyma), near Miletos, the long Sacred Way to the sea was lined with statues, many of them seated figures. Of the score or so that survive, one is roughly contemporary with the Hera of Cheramyes, and the rest are of the middle or second half of the 6th century B.C. A statue in the British Museum identifies itself by an inscription as Chares, the ruler of Teichiussa. He is a soggy, shapeless figure, slumped grossly on his throne. The lightly and variously channeled drapery does not conceal the awkward juncture of thighs and trunk. A statue acquired at Cape Phoneas in Samos depicts the same type of figure standing. Only one of the seated figures of Branchidai (PL. 25) has a head, but it is even more worn than that of the Phoneas man. This lack can be compensated by a marble head from Samos (Istanbul, Arch. Mus.), in which the bulletlike skull, boneless face, and flatly modeled hair demonstrate an unwillingness to probe beneath the surface features. Characteristically, the elongated eyes are half-shut, aslant, and bulging. Another head from Miletos (PL. 26) displays the same spirit but rather more skill; if the Rhodian looks sleepy, the Milesian may be called dreamy. The ultimate achievement of this tendency is a head in high relief from Ephesos (Br. Mus.), which is matched by a life-size ivory face from a chryselephantine image at Delphi. A crisper version of this plain style can be seen in fragments of reliefs from Didyma (PL. 27). These, like the head from Ephesos, are probably of the third quarter of the 6th century. Of much the same date is a slab from near Didyma (Br. Mus.); though presumably from a sloping parapet, it is often viewed horizontally and then praised for its thrusting movement.

The East Greek sculptors, even when they simplified the human form, neglected its basic anatomy; consequently, they are at their best with korai. The gesture of the Philippe of the Geneleos group (PL. 24) has already been mentioned. A bronze figurine from Olympia (PL. 31), very likely an East Greek contemporary, takes a firmer grip on her skirt. The consummation of this trick is seen in terra-cotta flasks from various East Greek sites and in fragments of statues from Samos and Klazomenai, in which one hand pulls the drapery tightly across the thighs and buttocks, and so creates a set of radiating folds. This device was adopted by Attic sculptors about 550 B.C. and appeared in other parts of European Greece as well. It is usually believed that the Attic artists borrowed from Ionia, but the time sequence seems rather close. Conceivably, the "Ionic" type of kore was developed in one of the Cyclades. There is a similar doubt about the origins of the flashy class of korai. The figures from Samos are modest; the few fragments from Chios, an island famous in literature for its sculptors, seem tame; and the Branchidai group is loutish. The chief representatives of the flashy style — one from the beginning, the other from the end, of the third quarter of the 6th century — are a head from a caryatid, once wrongly attributed to the Cnidian Treasury at Delphi, and the caryatids of the Siphnian Treasury at the same sanctuary. However, Siphnos is toward the west of the Aegean, and other sculptures of its treasury are more Attic than East Greek. Some of the reliefs from Ephesos may be Attic, too, if (as tradition has it) the Athenian Endoios worked there. There remain the kouroi, the earliest known examples being of the beginning of the 6th century; some are of colossal scale. A bronze statuette and a marble statue dedicated by Leukios, both from Samos, display the smooth, boneless style of the 560s. A statue from Samos (PL. 28) exemplifies a local ideal of virility about 520 B.C.

Reliefs of stone and molded terra-cotta revetments allowed more play for artistic invention. Their workmanship is often poor and their subjects dull or conventional, but occasionally lack of discipline produces a lively effect. A slab from a terra-cotta frieze (Stockholm, Nat. Mus.) that once decorated a building at Larisa in Aeolis represents a subject common on East Greek reliefs: a chariot race (the charioteer has a whip but no weapons) and, below the horses, a dog chasing a hare. Decoratively the juxtaposition of the two subjects is convenient, but by metropolitan Greek standards the logic of the combination is weak. This is inferior work of the mid-6th century. A little later in style is another set of terra-cotta reliefs, also from Larisa (PL. 34), that depicts a dinner party. Men and youths recline on couches, with food on tables in front, and are attended by pipers and serving boys. Below, dogs gnaw bones or chase what seem to be rats running up and over the furniture. Much more ambitious is a relief in Kos, probably from the base of a statue: on a couch an almost naked hetaira, with head bent back in profile and hair streaming down, reaches up to embrace a man on whose left thigh she leans and whose right arm holds out a lyre; on the floor in front, a fallen reveler teases the boy who tries to pull him up, while to the left and forward a piper plays on. The style, provincial rather than particularly East Greek, attempts the new anatomy that is best known from Attic works of the very end of the 6th century. But the composition in four planes, and perhaps the unique subject, suggests that the sculptor had not been educated in any strong tradition.

During the 5th century B.C., classical concepts spread and local independence disappeared. A transitional kouros from Samos is already beginning to conform to the general trend; and though some old-fashioned traits persisted for a time, they were not creative. While it is true that some of the classical monuments of Greek Asia were abnormal, such abnormalities were demanded by the Asiatic rulers who gave commissions. Nor were the sculptors necessarily Greeks of Asia: for example, those of the Mausoleion of Halikarnassos.

The East Greek style of sculpture flourished in the 6th century B.C. Its home area was extensive and there may have been local schools within it though, except perhaps at Samos, their peculiarities have not yet been determined. Its stylistic influence extended to at least some of the eastern colonies, notably Kyz-

ikos and Naukratis, and its effect can be observed in Phrygia and Lydia, Asiatic realms receptive of Greek culture. At Xanthos a series of reliefs from Lycian tombs were carved by Greeks, though their artistic allegiances are not always evident. At its best, East Greek sculpture has a superficial elegance — a quality not to be despised, though it rarely permits further progress. The contrast between East Greek sculpture and that of Greece itself remains a puzzle, for which racial inheritance and geographical situation give only glib and dishonest answers.

Very little of value can be said about the personalities of East Greek sculpture. Something is known of Geneleos from his signed group (PL. 24; FIG. 79), the style of which allows the attribution of other fragmentary statues at Samos. Some of the masons who carved figures at Branchidai added their

Reconstruction of the votive group by Geneleos, originally in the Heraion of Samos.

signatures. From later writers have come the names of Rhoikos, Theodoros, and Telekles of Samos; Telephanes of Phokaia (who worked for Darius and Xerxes); Mikkiades, Archermos, Boupalos, and Athenis of Chios; Bion of Chios (or Klazomenai or Miletos); and Bathykles of Magnesia-on-the-Maeander. It is worth noting that these sculptors worked for other cities besides their own. Archermos, so the scholia to Aristophanes assert, first gave Nike wings; and since a signature of Archermos and an early winged Nike were found near each other on Delos, it is often concluded that we have Archermos's original. But the statue from Delos looks more like an akroterion, to which the signature could hardly belong, and its style is not specifically East Greek, at least in the sense used in this article. For this reason, and for the greater glory of Ionia, some students extend the hegemony of East Greek (or Ionic) to include most of the Aegean Islands and Euboea. It would be as logical to call East Greek "festland-kykladisch." Nor is there much to be gleaned from the statements of Pliny the Elder and Pausanias that the Samians Rhoikos and Theodoros invented the hollow casting of bronze; Herodotus in a relevant passage (iv, 152) makes no mention of this claim. Certainly Samos did not keep a monopoly over the new technique, and not long afterward Kanachos of Sikyon in the Peloponnesos was making a bronze image at Didyma.

R. M. Cook

ARTISTS AND BIBLIOG. (*Sculptors*). *Lesbos*. Lesbothemis (Λεσβόθεμις) of Mytilene, where he worked between second half of 6th and beginning of 5th cent. B.C.: Muse with sambyke (ThB, s.v.; Lippold, GP, p. 64). – Archermos, Boupalos, and Athenis (see below under *Chios*). – *Pergamon*. Amyn[omachos?] (Ἀμυν[...]), son of Poseidippos; 6th–5th cent. B.C.: fragmentary signature on base with marks of two statues, from Pergamon (Altertümer von Pergamon, VIII, I, Berlin, 1923, no. 3; L. Guerrini, EAA, s.v.). – Boupalos and Athenis (see *Chios*). – *Phokaia*. Telephanes (Τηλεφάνης) of Phokaia (or Phocis?), probably active in first half of 6th cent. B.C. in Thessaly, as well as for the Persian kings (for works see GREEK ART, NORTHERN; M. Bieber, ThB, s.v.; Lippold, GP, p. 123). – *Sardis*. Dipoinos (Δίποινος) and Skyllis (Σκύλλις), brothers, probably from Gortyna; disciples or sons of Daidalos and teachers of Angelion, Tektaios, Theokles, Klearchos, Medon, Dorykleidas; lived in 7th or 6th cent. B.C.: Herakles, in gilded bronze, at Sardis (for other works see GREEK ART, AEGEAN; W. Amelung, ThB, s.v. Dipoinos; M. Bieber, ThB, s.v. Skyllis; Lippold, GP, p. 23; G. Cressedi, EAA, s.v. Dipoinos). – *Chios*. Melas (Μέλας), founder of a family of sculptors or eponymous hero of Chios; supposedly father of Mikkiades and grandfather of Archermos; his name appears in inscription of a base from Delos, signed by Archermos; perhaps sculptor or engraver of gems (RE, s.v., no. 28; Picard, I, p. 565; Lippold, GP, p. 62 ff.; S. Ferri, Plinio il vecchio, Rome, 1946, p. 224; J. Marcadé, Recueil des signatures de sculpteurs grecs, II, Paris, 1957, no. 66). – Mikkiades (Μικκιάδης) of Chios, son of Melas(?) and father of Archermos; doubts exist as to whether he was a sculptor and whether date of activity can be fixed ca. 600 B.C.; named as having dedicated two bases from Delos and Paros (Lippold, GP, s.v. Archermos, p. 62; J. Marcadé, ibid., no. 75). – Archermos (Ἄρχερμος) of Chios, thought to be grandson of Melas, was son of Mikkiades and father and teacher of Athenis and Boupalos; thus most likely active sometime during 6th cent. B.C. in Lebedos (Lesbos?) and Delos: winged female figure in Delos, related by some to a base for votive offering bearing his name and that of Mikkiades and identified (perhaps mistakenly) with Nike found near it in Delos; more recent signature (perhaps belonging to someone of the same name) from the Persian fill in Athens; dedicatory inscription from Paros by Mikkiades, perhaps referring to a work of his; inscription within the flutes of a column from Athens, giving only ethnic identification, attributed to him (Lippold, GP, p. 62 ff.; M. T. Amorelli, EAA, s.v.; J. Marcadé, ibid., nos. 21–22). – Boupalos (Βούπαλος) of Chios, son of Archermos and brother of Athenis; also an architect; besides collaborative efforts with his brother (see *Athenis*), made a Tyche with cornucopia in Smyrna and Charites for Smyrna, some of which were in Pergamon. Attributed works: signature from Athenian Acropolis with only ethnic identification, held to be related to Kore 675; Nike from the Acropolis, similar to the same kore in style; fragmentary inscription from Pergamon, with ethnic identification only, perhaps belonging to Charites group; Hera of Samos; two bases with forged signatures, found near Rome (W. Amelung, ThB, s.v.; Lippold, GP, p. 62 ff.; J. Marcadé, ibid., no. 37; L. Catteruccia, EAA, s.v.). – Athenis (Ἄθηνις) of Chios, son of Archermos and brother of Boupalos with whom he worked in Pergamon, Lesbos, Smyrna, Klazomenai, and Delos. Other works by the two brothers: mask of Artemis in Chios; Artemis at Iasos (Lasos?); caricature of Hipponax; statues in Delos and other islands. Their works or copies also said to have decorated pediments of the Temple of Apollo on the Palatine in Rome and those of many temples built during the reign of Augustus; columns of the Artemision in Ephesos attributed to Athenis (Lippold, GP, p. 62 ff.; J. Marcadé, ibid., no. 26; M. T. Marabini Moeus, EAA, s.v.). – Bion (Βίων) of Chios, or Klazomenai, probably lived second half of 6th cent. B.C. (Lippold, GP, p. 62; L. Guerrini, EAA, s.v., no. 1). – Sostratos (Σώστρατος) of Chios, father and teacher of Pantias, active ca. middle and second half of 5th cent. B.C.: colossal statue of Athena for Aliphera (Arcadia), executed together with Hypatodoros (G. Lippold, RE, s.v.; Lippold, GP, pp. 126, 176). – *Erythrai*. Endoios (Ἔνδοιος), probably of Athens, second half of 6th cent. B.C.: colossal wooden Athena in Erythrai; marble Korai and Charites, before Temple of Athena in Erythrai; wooden Artemis in her temple at Ephesos (for other works see ATTIC AND BOEOTIAN ART; Lippold, GP, p. 74; P. Orlandini, EAA, s.v.). – *Klazomenai*. Boupalos, Athenis, and Bion (see above under *Chios*). – *Smyrna*. Boupalos and Athenis (see *Chios*). – *Lebedos*. Archermos (see *Chios*). – *Samos*. Smilis (Σμῖλις) of Aegina, son of Eukleides and contemporary of Daidalos: xoanon in Heraion of Samos, represented on coins (see PELOPONNESIAN ART; M. Bieber, ThB, s.v.; Lippold, GP, p. 34). – Boupalos (see *Chios*). – Rhoikos (Ῥοῖκος) of Samos, son of Phileas, architect and bronzeworker; active in first half of the 6th cent. B.C.; along with Theodoros, considered to be inventor of hollow casting of bronze. Architecture: ca. 575 or 560–550 B.C., with Theodoros, built Heraion of Samos; probably identified with the labyrinth mistakenly called Lemnian, which he is said to have built with Theodoros and (mistakenly) Smilis. Bronzes: Nyx on the altar of Artemis Protothronia in Ephesos; crater made in collaboration with Theodoros, in Temple of Apollo at Patara (C. Weickert and M. Bieber, ThB, s.v.; Lippold, GP, p. 58 ff.; Dinsmoor, p. 124 ff.). – Theodoros (Θεόδωρος) of Samos, son of Telekles and brother of Rhoikos — or son of Rhoikos and brother of Telekles; bronzeworker, probably identified with the carver and engraver of gems and with the architect; active in first half of 6th cent. B.C.; invention of hollow casting of bronze attributed to him, together with Rhoikos. Bronzes: Apollo Pythios in Samos, in collaboration with Telekles (half the statue was made by Theodoros in Ephesos, the other half by Telekles in Samos); self-portrait, holding a file in his left hand and a tiny quadriga in his right; appears as dedicator in an inscription from the Acropolis of Athens. Toreutics: silver crater, ex-voto from Croesus at Delphi; gold crater owned by kings of Persia; bronze crater, made with Rhoikos in Patara; golden vine with clusters of emeralds and rubies, owned by kings of Persia. Gem carving: Polykrates' ring. Architecture: Heraion of Samos, with Rhoikos; foundations for Artemision in Ephesos; *skias*, or assembly hall, in Sparta (W. Züchner and M.

Bieber, ThB, s.v.; Lippold, GP, p. 58 ff.; Dinsmoor, pp. 119, 124 ff.). – Telekles (Τηλεκλῆς), bronzeworker, thought to have been active in second half or ca. end of 6th cent. B.C. (see above under *Theodoros*; M. Bieber, ThB, s.v.; Lippold, GP, p. 59). – Geneleos (Γενέλεως), probably of Samos, active ca. mid-6th cent. B.C.: votive group of six statues along Sacred Way to the Heraion of Samos, of which three statues, fragments, signature, and dedication remain (Lippold, GP, p. 57; EAA, s.v. Geneleos). – Pythagoras (Πυθαγόρας) of Samos (or Rhegion), active ca. 480–448 B.C. (see GREEK ART, WESTERN). – *Ephesos*. Endoios (see above under *Erythrai*). – Rhoikos (see above under *Samos*). – *Magnesia*. Bathykles (Βαθυκλῆς) of Magnesia-on-the-Maeander, architect and sculptor active at Amyklai (Laconia), ca. end of 6th cent. B.C.; however, also placed at end of 7th cent. and held to be almost mythical figure (for works see PELOPONNESIAN ART; Lippold, GP, p. 55 ff.; M. T. Amorelli, EAA, s.v.). – *Miletos*. E[u]demos (or Epidemos? Echedemos?; E[ὔ]δημος), probably of Miletos, lived ca. mid-6th cent. B.C.: seated statue on Sacred Way of the Didymaion (Lippold, GP, p. 53; G. Fogolari, EAA, s.v.). – Terpsikles (Τερψικλῆς) of Miletos, active ca. mid-6th cent. B.C.: Anaximandros (the philosopher?), perhaps part of a group, in the Didymaion; base with dedication is preserved (M. Bieber, ThB, s.v.; Lippold, GP, pp. 47, 52 ff.). – Kanachos (Κάναχος) of Sikyon, brother of Aristokles, 6th–5th cent. B.C.: Apollo Philesios in the Didymaion of Miletos, taken to Ecbatana by Persians and returned by Seleukos I (Nikator); beside the god was a deer that moved mechanically. Attributed works: Artemis, known through coins of Miletos; marble torso from theater of Miletos (for other works see PELOPONNESIAN ART; ThB, s.v., no. 1; Lippold, GP, p. 86 ff.). – Kydim[andros] (or Kydim[enes]?; Κυδιμ[...]), named as father of [Pa]sikles (or Tsikles, Isikles, Hesikles; [Πα]σικλῆς) in dedication of bronze astragal that must have been used as base of an ex-voto, which was taken to Susa in 494 B.C. from the Didymaion of Miletos (G. Lippold, RE, s.v. Tsikles; Lippold, GP, p. 55). – Bion (Βίων) of Miletos, son of Diodoros; perhaps emigrated to Sicily after destruction of the city (494 B.C.): signed base, at Delphi, held to refer to Nike and golden tripod he made, which Gelon of Syracuse dedicated after his victory of Himera (480 B.C.) (Lippold, GP, p. 122; J. Marcadé, op. cit., I, no. 9; M. T. Amorelli, EAA, s.v., no. 3). – *Iasos*. Boupalos and Athenis (see *Chios*). – *Halikarnassos*. Daidalos (Δαίδαλος), son of Eupalamos or Metion, of Attic origin but active in Crete and the west: Artemis Monogisene (doubtful) in Caria; signed base at Halikarnassos, belonging perhaps to copy of a work attributed to him or to Daidalos of Sikyon (for other works see GREEK ART, AEGEAN; Lippold, GP, p. 18 ff.; A. De Franciscis, EAA, s.v. Dedalo). – *Birthplace unknown*. Pythis (Πῦθις), of Ionian origin, active in Athens in 6th–5th cent. B.C.: column, probably support for a statue, and base signed in Attic alphabet, from the Acropolis (A. E. Raubitschek and L. H. Jeffery, Dedications from the Athenian Akropolis, Cambridge, Mass., 1949, p. 15 ff., no. 10, p. 98 ff., no. 90, p. 524). – *Naukratis*. Sikon (Σίκων), a Cypriote, from second half or end of the 6th cent. B.C.: statuette in Naukratis (Aphrodite?), of which only the inscription and lower part remain (Lippold, GP, p. 67; G. Lippold, RE, Sup. VIII, s.v. no. 2).

*Toreutic artists*. Glaukos (Γλαῦκος) of Chios, probably active ca. 7th–6th cent. B.C., but assigned by some to beginning of the 7th cent.: considered to have invented craft of soldering iron: silver crater on iron support, ex-voto of Alyattes II of Lydia at Delphi (Lippold, GP, p. 64; EAA, s.v.). – Rhoikos and Theodoros of Samos (see above under *Samos*). – Myrmekides (Μυρμηκίδης) of Miletos (or Athens?), archaic miniaturist in metal: miniature ship and quadriga (W. Müller, ThB, s.v.). *Gem engravers*: Melas of Chios, sculptor and gem engraver (see above under *Chios*). – Mnesarchos (Μνήσαρχος) of Samos, first half of the 6th cent. B.C., father of the philosopher Pythagoras (W. Müller, ThB, s.v.; Sieveking, RE, s.v., no. 6). – Theodoros of Samos (see above under *Samos*). – Aristoteiches (Ἀριστοτείχης), engraver or owner of gems, ca. 6th–5th cent. B.C.: scarab with representation of a lioness (signed) from Pergamon (E. Pernice, ThB, s.v.; A. Stazio, EAA, s.v.). – Epimenes (Ἐπιμένες) of Ionia, perhaps from Paros, active ca. 500 B.C.: scaraboid (signed) with representation of a horse tamer (E. Pernice, ThB. s.v.; A. Stazio, EAA, s.v.).

* *

ARCHITECTURE. The Ionic style of architecture, though brought to its classical perfection in Athens during the late 5th century B.C., was established much earlier in the East Greek regions. Because its general character has been defined elsewhere (see ARCHAIC ART), discussion here will be confined to some of its early and Asiatic peculiarities.

Architecture, that is, construction designed and executed with precision, seems to have begun in Greece itself about the middle of the 7th century B.C. In the East Greek region the beginnings cannot have been much later, since a large member of a column (more probably capital than base; PL. 36) has been found at Old Smyrna, which was destroyed about 610 B.C. It is presumably by accident that no other remains are certainly earlier than the second quarter of the 6th century. The style at this time is far from uniform — in this too contrasting sharply with the contemporaneous Doric style across the Aegean — but the erection of very large temples presupposes some architectural experience.

Capitals are not, of course, the essential characteristic of an order, but they have been the most studied. There are — to omit the member from Smyrna mentioned already — three types

Ephesos, Artemision, reconstruction of the plan of the 6th cent. B.C. (*from D. S. Robertson, A Handbook of Greek and Roman Architecture, 2d ed., Cambridge, 1954*).

of capital in or connected with Ionic: the Ionic capital proper; a second that, to avoid ambiguity, may be called the "Aeolic volute capital"; and the leaf capital.

The leaf capital, with its fronds flattened against the drum or turning out and over at the top, is sometimes used alone and sometimes, perhaps, as a supporting member beneath the Aeolic volute capital. This leaf type occurs in some nondescript buildings in Aeolis — hence some tiresomely call it "Aeolic" — and in two elaborately Ionic treasuries at Delphi, those of Klazomenai and of Massilia (mod. Marseilles); in the latter example the usual restoration improbably doubles the capital. Because no known example is later than the 6th century B.C., it does not seem likely that the Pergamene leaf capital of the 2d century is its direct descendant. Presumably both the early and the later forms were adopted from the Near East, where similar capitals were common enough.

For the Aeolic volute capital also (PL. 36; I, PL. 334), there are Oriental parallels, although those usually cited have an upright triangle at the base of the volutes. This capital, which is more generally known as Aeolic — or tendentiously, proto-Ionic — is most obviously distinguished from the true Ionic by the deep V-shaped junction formed by the volutes as they spring vertically from the shaft. In some accepted restorations the capital rests on a member with flat or pendent leaves, which is compared to the echinos of developed Ionic, with its egg-and-dart molding; but it cannot be proved that the leaf member is not the sole capital of another column. Carved volute capitals of Aeolic type, differing in more than details, have been found in nondescript buildings in Aeolis and can probably be dated about the second quarter of the 6th century. Other so-called "Aeolic" capitals with the volutes painted on a flat face come from an archaic context in Athens, and on a Clazomenian sarcophagus of about 500 B.C. both the Aeolic and the Ionic capitals are depicted. The relation of Aeolic to Ionic capitals is unknown. Many students regard the Aeolic as the older form, perhaps because it died early and, indeed, never established itself in reputable architecture; others think that the relationship was collateral. It is also conceivable that the Aeolic capital developed from the Ionic; something similar appears in Tarentum in the 5th century B.C., though there the evolution led toward Corinthian.

Ionic capitals and bases of the archaic period: (*a*) Capital from the Artemision in Ephesos; (*b*) base from the Artemision in Ephesos; (*c*) base from the Heraion of Samos.

The earliest surviving Ionic capitals are more or less contemporary with the earliest surviving Aeolic. The first Ionic examples are that of the column bearing a sphinx dedicated at Delphi by the Naxians (PL. 13) and a recent discovery in Paros; presumably these capitals are Naxian and Parian work. Another very early capital has been found in Naxos itself, and there are capitals presumed Naxian in Delos. There is also, from the Temple of Apollo at Naukratis, a capital with egg-and-dart molding that may or may not have been surmounted by a volute member now lost. What contribution Naxos or Paros may have made to the Ionic capital and order is not known or considered. But there is a general similarity between the Delphi capital of about 570 B.C. and capitals from the Artemision at Ephesos (FIG. 83), constructed perhaps fifteen or twenty years later. The volute member is very wide, with an almost cylindrical pulvinus (or cushion) and no eye. Since the volutes are spread clear of the shaft of the column, the overcurling egg-and-dart molding continues, though curtailed, beneath them. These are all signs of early date, after which there is probably fairly steady progress to the classical form; even so, the style was still fluid in the 6th century. At the Artemision in Ephesos the spirals of some volutes are replaced by rosettes, and on some early capitals — the piece from Paros, several smaller examples in Delos, perhaps the member of the Naxian column in Delphi — the volutes end in separate lobes with a plain surface or a floral design between. All these early capitals were much wider on the face than on the side, and where — at the corner of a peristyle — two rows met at a right angle, a plausible transition was necessary. How this was managed is not known — whether by giving the corner capital two adjacent faces that intersected or bent outward back to back, or by setting the capital aslant, or in some other way; yet, awkward as any of these solutions may seem, the Ionic capital continued to flourish, and the all-round leaf capital was soon abandoned. In the classic period the capital was standardized; nor is there any essential difference between examples from Greek Asia and those from European Greece, except perhaps that the East Greek *canalis* makes a lazier curve, in this being nearer to the canon later prescribed by Vitruvius.

Little need be said of the shafts of the columns. The earlier ones tend to be thicker than those that are later, and till the 5th century B.C. the flutes are usually separated by an arris that is sharp. They also vary in number, larger columns generally having more flutes than smaller ones. In a few elaborate Ionic porches of European Greece, caryatids take the place of columns, but there is as yet no trace of any caryatid from an East Greek site. About the third quarter of the 6th century caryatids appeared in three treasuries at Delphi: the Cnidian, the Siphnian (I, PL. 334), and another, unidentified one. The next known caryatids are those of the Erechtheion in Athens.

Ionic columns always stood on bases, which in turn sometimes stood on square plinths. The earliest type of base was a plain drum, cylindrical or slightly conical in shape; such a drum is found beneath the Column of the Naxians at Delphi and in some early structures of Delos, Samos, and Aegina. More elaborate bases appeared by the middle of the 6th century. According to Pliny the Elder, the architect Theodoros invented a process of turning column bases on a lathe, and in his Heraion of Samos (ca. 560 B.C.) some of the bases that have been found were lathe-turned. The new technique lent itself to horizontal channeling and was exploited with due vulgarity. The two best-known systems were the Samian and the Ephesian, but — as finds in Chios have made very clear — there was no orthodoxy. The Samian base flaunts a large convex member above a large concave member, both busily fluted; at the Artemision in Ephesos, about 550 B.C., there were bases whose lower part had a more vertical face with two much broader channels (FIG. 83). The Ephesian base developed into the standard Ionic base of the East Greek region, where till the 3d century B.C. it held its own against the more harmonious base that Attic architects had established in the early classic period.

The local East Greek entablature, as far as is known, at first consisted of an architrave in three fasciae, surmounted by dentils. The "Ionic" frieze, which replaced the dentils but gave the entablature greater height and often enlivened it with sculpture in relief, appeared about the third quarter of the 6th century in treasuries at Delphi and became a regular feature in the Ionic style of Greece itself. In the East Greek region the frieze was not admitted till the middle of the 4th century. A few East Greek buildings, including the largely Doric temple at Assos (FIG. 84) of the late 6th century, had an undivided archi-

Assos, Temple of Athena, reconstruction: (*a*) Façade; (*b*) plan (*from R. Koldewey, Investigations at Assos, London, Cambridge, Leipzig, 1902–21*).

trave carved in relief (PL. 35); but the normal place for sculpture was on the sima that ran round the edge of the roof. A marble relief in the British Museum is probably from such a sima, and from as far afield as Amisos there are several smaller archaic slabs of terra cotta that crowned buildings of Ionic or less definite style. The origin of the decorated sima is said to be in the non-Greek architecture of Asia Minor.

The Ionic style always used moldings more lavishly than the Doric, and in its early phase sometimes to excess. The favorite motif was the ovolo carved with egg-and-dart, which began as a half-round and after some experiment attained the standard forms. The eggs themselves were at first much squarer and may have had the same origin as the ornament of the leaf capital. In Chios some unusual moldings have been found, as well as classic anta bases in the shape of giant claws. Also in Chios a local red limestone was sometimes used instead of the normal whitish stones.

Though they were addicted to the showy and grandiose and in the 6th century completed some of the largest of Greek temples, the eastern Greeks found little place for sculpture in their architecture until they borrowed the frieze from European Greece. Till then the only regular position for sculpture was the sima edging the roof, and there sculpture is too remote and excrescent. The designers of the archaic temples at Ephesos and Didyma experimented with carved pedestals, or podia, for their columns, and the 4th-century rebuilders of the Ephesian temple piously repeated the device. Modern students cannot be blamed for failing to agree on the architectural placing of the relief sculpture of the Mausoleion of Halikarnassos, though it was built when Greek architecture was mature.

In general planning, the Ionic and Doric styles are similar. Some very large East Greek temples double the side and treble the end colonnades. There is a liking for a deep pronaos containing columns, with some grander temples having the columns in front of the door very widely spaced to create a more imposing entrance. In Lycia and perhaps in Caria, where Greek influence was felt, there was a tradition — whether native or imported — of tombs set on a high podium, in which (as in the Mausoleion of Halikarnassos, constructed in the mid-4th century B.C.) the Ionic order was sometimes incorporated.

Ionic of more specifically East Greek character may yet be discovered; but what is now known suggests strongly that the endemic style — though clever and even versatile — lacked the clarity and discipline of the Ionic, let alone the Doric, of Greece itself. The impression East Greek Ionic gives is strange and wayward, and not merely because modern taste is used to European Ionic; it is not surprising to see the style transmuted, presumably by East Greek craftsmen, to suit the more barbaric tastes of the Achaemenid kings of Persia.

On some minor structures also there are features that may usefully be considered architectural. A group of archaic grave steles from Samos is the most compact and illuminating set of examples. Their standard form is a tall, narrow slab, inscribed with the name of the dead person; above is a finial, or anthemion, composed of volutes and a palmette. One of the finest of these finials appears on a stele in Samos not much after the middle of the 6th century; the lower space between the volutes should be completed with a lotus flower. The palmette, imaginatively unnatural, has its leaves alternately convex and concave. The supporting volutes are of a regular type: gently hollowed and encircling a neat rosette, they are used as independent units of ornament, which can be built up in tiers. There are other and later finials with the outer ends of their volutes cut short, so that the effect resembles that of an Aeolic capital. The decorative forms of early Ionic were very adaptable.

R. M. Cook

Samos, Heraion, reconstruction of the plan in successive periods. *Key*: (1) Before Rhoikos; (2) at the time of Rhoikos (first half of 6th cent. B.C.); (3) 6th–5th cent. B.C.; (4) period of Polykrates (535–523 B.C.); (5) Roman period (*from AM, LXXII, 1957, with additions*).

Artists and bibliog. (*Architects*). *Chios*. Boupalos (see above under *Sculptors*). – *Samos*. Rhoikos and Theodoros (see *Sculptors*). – Mandroklees (Μανδροκλέης) of Samos, architect and perhaps painter: bridge across the Bosporus, built by order of Darius during expedition against Scythians in 514 B.C.; painted or dedicated a picture of Persians crossing the Bosporus on the bridge he constructed, in Heraion of Samos; accompanying epigram has come down to us, with the name corrupted to Mandokreon (Pfuhl, I, p. 498; E. Fabricius, RE, s.v., no. 1). – Eupalinos (Εὐπάλινος) of Megara: aqueduct at Samos, with long tunnel, built for Polykrates (535–523 B.C.; M. Schede, ThB, s.v.; G. A. Mansuelli, EAA, s.v., no. 1). – *Ephesos*. Chersiphron (Χερσίφρων) of Knossos, also active in theory of construction engineering: Artemision in Ephesos, built on remains of an older temple and of another temple, perhaps by Theodoros of Samos (see *Sculptors*); collaborated on Artemision with his son Metagenes, 560–546 B.C.; some believe he also built the temple preceding that from the time of Croesus (E. Fabricius, RE, s.v.; L. Guerrini, EAA, s.v.). – Metagenes (Μεταγένης), son of Chersiphron, with whom he worked and whom he succeeded in construction of the Artemision in Ephesos; also wrote on construction technique (C. Weickert, ThB, s.v., no. 1; E. Fabricius, RE, s.v., no. 5). – *Magnesia-on-the-Maeander*. Bathykles, also a sculptor (see *Sculptors*). – *Miletos*. Hippodamos (q.v.).

Conclusions. By comparison with the art of Greece proper, East Greek art is surprisingly uniform and mediocre. In pottery its Geometric style had some modest peculiarities, but when it became ambitious, it merely aped Attic models. Its principal Orientalizing style, the wild-goat style, which persisted for about two hundred years, never achieved or aimed at more than decorative neatness. The later archaic styles, reserving or black-figure, showed an erratic and delusive promise. Indeed, the most satisfactory lines were placidly conservative — the

Bird bowls of the 7th century B.C. and the Vroulian cups of the 6th. While it might be argued that in East Greek lands vase painting was always a minor art, local customers evidently appreciated the superior products of Corinth and Athens.

Sculpture was hardly more impressive. Very little is known of the school of the 7th century B.C., if there was one. In the 6th century an ideal developed that differed greatly from that of European Greece. The round, fleshy forms and superficial cleverness may perhaps express a less athletic view of life, but such excuses do not justify the sculptors' neglect of anatomical structure and even of elegance. With the 5th century the Panhellenic style became dominant, and if in some classic works East Greek traits can still be recognized, they are provincial relics rather than active components. The same is presumably true of monumental painting. There is no reason to believe that Polygnotos (q.v.) of Thasos, for example, painted with a northern — let alone Ionian — accent.

It was only in architecture that the East Greek school had a lasting effect on Greek art. Wherever the Ionic order germinated, its early development was in Ionia; even so, refinement and regulation of the style seem to have been left to the Athenians of the late 5th century B.C. In general, it may be said that the essential character of East Greek art was decorative; its styles, which paid more attention to surface than to substance and to detail than to the whole, are one of the byways of Greek culture.

**GREEK ART, NORTHERN.** Mainland Greece to the north of the Gulf of Corinth (Korinthos), except for its eastern arm (which contains Boeotia and Attica), may not be considered in the same category of artistic achievement as other Greek territories that produced more original creations and evidenced more intense development (see ATTIC AND BOEOTIAN ART; GREEK ART, AEGEAN; PELOPONNESIAN ART); rather, it is an area in which, apart from the concentration of monuments at the sanctuary of Delphi, cultural and artistic manifestations are infrequent and of secondary quality. With that area it is convenient to treat also the art of those Balkan countries which were partly Hellenized and other areas of the north to which Greek influences spread, as well as the art of the Greek settlements in Epirus and Illyria and along the northern coasts of the Aegean and the Propontis. As a general rule, it may be assumed that the Heptanesos (Ionian Islands), Aetolia, and Epirus were directly under the influence of Corinth. Corinthian influences were similarly evident in the interior regions of Illyria and Thrace, extending as far as isolated discoveries that have been made at Trebeniště. To the east, however, at least from the southern coasts of Thrace, from Kavalla and Komotini, as far as the Propontis and the Black Sea (Pontos Euxeinos), the artistic idiom was prevalently Ionian, with noticeable Cycladic influence in the zone most directly in contact with Thasos.

SUMMARY. Locris and Phocis; Delphi (col. 88). Aetolia and Acarnania (col. 98). Epirus and Illyria (col. 100). Ionian Islands (col. 102): *Ithaca; Kerkyra*. Euboea (col. 105). Thessaly and Macedonia (col. 106). Thrace and the Propontic littoral (col. 109).

LOCRIS AND PHOCIS; DELPHI. Phocis, like Locris, between whose eastern and western divisions it lies, is a poor and mountainous region that cannot be said to have made any truly distinctive contribution to artistic endeavor. It appears to have been dominated by Corinth and by neighboring Boeotia, at least in the production of votive terra cottas. The most ancient and authentic sculpture from the region would seem to be a stele fragment of Daedalic type, found on the Boeotian border at Malessina (PL. 38): there remains only the head of a woman, stiffly frontal and held almost as if weighed down by her expansive coiffure. This head was modeled by a clumsy hand that seems unskilled even when compared with the very crude contemporaneous Boeotian sculpture, such as the torso of Tanagra and similar works. The kouros head from Galaxidi (PL. 38), like so much contemporaneous Boeotian sculpture, shows the influence of insular art centers; and the same influence is seen in the stele of Agasinos from Korseia, which dates from the beginning of the 5th century. The somewhat later relief from Larymna showing the sacrifice of a ram (Phrixos?), which dates from the pure classic period, displays a simple arrangement in its fluttering drapery. The great terra-cotta offerings from Elateia and Kirrha seem to belong entirely within the general development of Boeotian art. A more markedly individual character may be discerned in the antefix with a gorgoneion found subsequently in the Temple of Athena at Antikyra (PL. 38).

It seems quite futile to attempt to retrace and group such scant threads of evidence. What is known of the activity of Kalamis in Phocis, where he left a statue of Iphitos, or of Praxiteles (qq.v.), who carved the cult statue of Artemis for her temple at Antikyra, cannot be related to any survivals of the sparse local production and thus remains without illustration. In the same way, Menaichmos and Soidas, Locrians from Naupaktos (Lepanto) who were the sculptors of a chryselephantine statue for the worship of the Artemis Laphria of Kalydon (Calydon), are extremely nebulous personalities. An attempt to trace the character of this sculpture in a coinage type which may be derived from the archaic Artemis of Pompeii–Castiglione della Pescaia has not been generally accepted by critics.

Very different from the modest provincial role of Phocis as a whole during the vital centuries of creative activity in the Hellenic world was the part played by its sacred city of Delphi (PL. 37; III, PL. 340). In fact, Delphi as a religious center belonged to the whole of Greece and partook of the varied artistic forms of the most diverse and remote localities. Although Delphi evidenced no indigenous, truly original creative vitality, for more than a thousand years the great sanctuary provided one of the most solemn and official backdrops for significant artistic achievements of the whole Hellenic world.

Its remote and mountainous site did not protect Delphi from almost total destruction. Plundering must have begun early, for Pausanias records that on Nero's orders alone more

Chief sites of northern Greece and the Propontic littoral. *Key*: (1) Regional boundaries. The upper inset shows Greece and Anatolia with the cities of the south coast of the Pontos Euxeinos.

than five hundred bronze statues were sent to Italy from the sanctuary. Study of the temple foundations and the great pedestals despoiled of their statues, as well as the minute descriptions left by the much-traveled Pausanias, affords but a fragmentary estimate of the immense artistic wealth accumulated during so many centuries at Delphi. The names are so famous, the records so infused with glorious and poetic associations, that their evocative power seems to have triumphed over the devastation. From the records and monumental ruins of Delphi, there emerge vivid ghosts from the world of myth and picturesque characters from history: Neoptolemos (Pyrrhos), slain in the sanctuary by Orestes, had a heroön at Delphi; Alyattes and Croesus, kings of Lydia, sent elaborately worked metal craters to Delphi; the wise tyrant Kypselos dedicated a treasury there; and Alexander was glorified in rich votive offerings made by his general Krateros. Within the sanctuary itself, the statue of Homer was not far from the golden image of Phryne carved by Praxiteles; along with the tripod of Plataia and the monument of the Roman general L. Aemilius Paulus (PL. 260) were images of Antinoos.

While the sanctuary at Olympia was from the beginning of history the meeting place of the Hellenic peoples in quest of a spiritual center, the sanctuary at Delphi was the focus of an even wider field of influence, extending beyond the frontiers of the Hellenic world; the fame of the Delphic oracle and its surpassing wisdom spread through the semi-Hellenized Anatolian states and great Asiatic states much farther away. If the works of art dedicated in Olympia were generally votive

offerings that had some athletic or competitive significance, the monumental offerings of Delphi were commonly of a civic or political character. Delphi came to wield an occult directive power in the political life of Greece and in relations between the Greek peoples and their barbarian neighbors. The influence of the oracle was increasingly decisive in military and political undertakings, especially in the establishment of colonies; hence, to secure a dominant position at Delphi and be able secretly to influence the pronouncements of the oracle became a constant political objective, especially for Sparta, and in a lesser degree for Thessaly. The prudent and reactionary attitude of the oracle with regard to Persia, and toward the generally aggressive policy of Athens when confronted with Asiatic expansionism, was a notable example of such maneuvering.

The Delphic sanctuary must have offered an incomparably vivid and varied panorama of historical events among the Hellenic peoples. Within the sacred precinct, the cities and peoples of Greece delighted to celebrate through offerings of elaborate and symbolic monuments the actual or officially proclaimed successes of their history: famous battles, alliances, and victories. Thus, Arcadia glorified the Battle of Leuktra in a series of statues of gods and local heroes; Sparta exalted her sea captains in an exedra with 37 statues; Thessaly recalled the Battle of Potideaia in a group representing the struggle for the tripod. Argos drew attention to her ancient origins with a row of 20 statues of Argive kings, celebrating the foundation of Messene; near at hand, in a series of votive offerings related in character to these, Argos presented replicas of the Seven against Thebes, the chariot of Amphiaraos, and the Epigoni. In addition to these preeminent monuments, there must also have been votive offerings of a more conventional character: chariots for ceremonial games; tripods and statues of athletes, heroes, and gods, among which the most numerous were statues of Apollo. The names of Delphic artists which have survived include some of the most famous that are known. Phidias (q.v.) was responsible for at least some of the statues that constituted the Athenian offering for Marathon; Hageladas carved the long series of Tarentine votive monuments celebrating the victory over the Messapians; Onatas of Aegina and Kalynthos carved those for the defeat of the Peucetians. Amphion of Knossos is remembered as the sculptor of the quadriga of Cyrene, Kalamis for having carved a famous statue of Hermione, and Myron (q.v.) and Pythagoras for statues of athletes.

The lesche of the Knidians held two great paintings by Polygnotos (q.v.) that not only were two of the masterpieces of ancient painting but may also have represented a decisive turning point in the ancient world's conception of form. To judge from surviving descriptions, these paintings must have been among the first examples of the elevation of human drama from a purely physical plane to an intensely spiritual treatment. These great Nekyia (Descent of Odysseus into Hades) and Ilioupersis (Sack of Troy) scenes, both in their vastness of subject and in their noble spirituality, must have constituted one of the loftiest expressions of ancient art, for the fervent admiration they aroused has echoed down to modern times.

This was Delphi as known to the citizens of the Roman Imperial epoch, and as Pausanias described it in the 2d century — quite different from the image the modern scholar may be familiar with, after a century of study and research into the deepest strata of the sanctuary. Very little of what Pausanias admired has come down to modern times; but in compensation for this loss, much that the Greeks of Roman Imperial times never knew or perhaps never even suspected has fortunately come to light again. Earthquakes, landslides, and other natural disturbances have indirectly preserved incomparable remains already apparently lost by the classical age.

Among other features, Pausanias describes the great temple of the 4th century B.C., with its pediments filled with sculpture by Praxias, and gives a short account of its earlier stages, as far back as the very ancient building of beehive form recognized as a Mycenaean tholos (corbel-vaulted) tomb. In modern times the importance of the Mycenaean site of Delphi can be appreciated, for it has yielded rich deposits of pottery, a superb rhyton in the form of a lioness head, and even idols of the mother goddess, which appear to be eloquent proof that Apollo was a latecomer at Delphi long preceded by Ge (Gaia; Earth) and the serpent Python. While it is true that the sculpture Praxias created for the most recent temple has not survived, exploration of the lowest depths of the sanctuary has restored precious remains of the pediment decoration of the archaic temple dedicated by the Alkmaionidai. According to tradition, the most ancient wooden statue of Apollo was an offering from the Cretans (Pindar, *Pythian Odes*, 5, 40). As a matter of fact, among the findings from the sanctuary is the best-preserved Cretan bronze statuette known, the small Apollo with a girdle. This find has been supplemented by fragments of a shield and a magnificent helmet adorned with a goddess riding a bull, which are also Cretan (mid-7th cent. B.C.).

The sumptuous offerings from the East may be visualized by studying a fragment of a sacrificial chariot in bronze, of a rare, apparently Cypriote type; many *Assurattaschen*; and a large gryphon head in beaten metal, which must have come from one of the colossal craters generally found in eastern regions and in Etruria. Particularly abundant are the archaic and Geometric bronzes: tripods, statues, and plates from Argive-Corinthian shields. The imported ceramics, though found less frequently than these bronzes, are of fine quality. Corinth, naturally the most illustrious source, is represented by a superb Geometric crater and choice pieces from every phase, up to the extraordinary late Corinthian fragments with the Athena Promachos (possibly from an Ilioupersis, as H. Payne presumes) and with the Hermes leading the three goddesses to the judgment of Paris. There are other remarkable fragments of refined Cycladic plates. The Attic production, noteworthy for its black-figured wares — especially for the fragment of a large crater decorated with animal motifs — provides few examples from the red-figured phase. The discovery of a refined alabastron in a tomb, a work signed by Pasiades, furnished one such example.

But the most sensational find at Delphi is the outcome of the excavation of the Sacred Way that revealed numerous fragments of ivory (I, PL. 341) and of gold laminae (I, PL. 375), which comprise our first contact with the famous chryselephantine statues of antiquity. The most ancient statue found here, a lion-taming Potnios (VIII, PL. 238) of Asiatic type, shows a facial resemblance to the ivories of Ephesos and Sardis. The most recent studies of the mysterious traditions of ivory carving (so far as known, the Greeks, at least before the time of Alexander, had no precise knowledge of this material which, because of its resemblance to living tissue and its unearthly beauty, the gods themselves had used to restore the missing shoulder of Pelops after the monstrous banquet of Tantalos) have confirmed the curious aggregate of instructions and traditions that formed the fund of technical and formal lore common to workers in ivory, regardless of nationality. Therefore odd interdependencies and mixtures of style in this medium may be expected; and this Potnios, of such discrete and inorganic structure, may yet be attributed to the Greek world. Moreover, it is a strange fact that in Samos, much farther to the east, such a wonderful example of lucid Hellenic structure as a small kneeling kouros of about the mid-7th century B.C. may be found beside nonorganic figures of Oriental type. The remaining ivory carvings, eight more or less fragmentary heads, and parts of robes and tresses in gold sheet found at the sanctuary may be more definitely ascribed purely Hellenic origins and apparently do not date from earlier than the mid-6th century. Other heads show a timid but refined manner of modeling, while certain robes decorated with fabulous beasts may with some certainty be assigned to an eastern school. Attribution of openwork friezes to the same source seems less convincing, for the intense vitality of the minute figures and the fondness for detailed and excited narrative are more reminiscent of Corinthian examples. Also significant are the common features of certain schemes, such as that of the departure of Amphiaraos.

Of the larger sculpture from Delphi, the most noteworthy examples that may be assigned to the beginning of the 6th century B.C. are the twin statues of Kleobis and Biton signed by Polymedes (?) of Argos (I, PL. 342, lower right). These two works fix a starting point of indisputable authority for study of the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Argive school, for which there are so few monumental examples to substantiate the copious literary references. The possibility, hazarded by Guido von Kaschnitz-Weinberg, that one of these brothers was carved not by the Argive Polymedes but by a pupil of Ionian origin has not been convincingly proved. Certainly, the profound sense of virility emanating from the pair marks it as one of the clearest possible characterizations of the anonymous and abstract type of the kouros.

Insular Greece is represented at Delphi with consummate authority by an even more monumental and ambitious work, the great Sphinx of the Naxians (PL. 13). The fabulous animal is set in profile on a capital and flexes a long, slender, almost consumptive body, similar to those of the Naxian lions of Delos. The visage and the subtle design of the varied plumage betray somewhat chastened and softened lines, as if the hand of the sculptor was guided by his material, the translucent coarse-grained marble of the islands. There could be no more telling contrast than that between this almost schematic profile from the Cyclades and the frontal presentation and aggressive, vibrant realism of the Peloponnesian statues by Polymedes.

The metopes of the Treasury of the Sikyonians demonstrate the Corinthian style, with the fondness for diffuse and varied narrative that is sometimes difficult to fix within the confines of a metope. Thus, along with beautiful carved images that are compact and well-balanced (Europa on the bull, Phrixos on the ram), there are other representations incomparable for the daring and originality of their composition, scenes that were ingeniously handled within such a limited space — the ship Argo with the Dioskouroi, or the sons of Aphareus bearing away the heifers (I, PL. 343).

During the second half of the 6th century B.C., Ionian and insular art once again came to predominate at Delphi. Some torsos of kouroi are ascribed to the island of Paros. The Ionic treasuries of Knidos, Massilia (mod. Marseilles), and Siphnos have yielded figural friezes and exquisite architectural adornments. Sumptuous and delicate female figures support the façade architraves of the treasuries of Knidos and Siphnos (I, PL. 334) and of another, nameless treasury. The Treasury of the Siphnians, the most complete of all, may be dated with uncommon precision about the year 525 B.C.; accordingly, it constitutes an extremely important piece of evidence for the chronological arrangement of Greek sculpture. With regard to individual segments of the Siphnian sculpture, important problems remain to be solved, and no agreement has yet been reached on a more detailed classification. It is undoubtedly true that the collaboration of two or more masters of very different styles may be discerned in the frieze, and it is agreed that a Naxian character may be attributed to the one who shows a more dilute plastic sense and a tendency toward calligraphic outlines; but the question remains open as to which should be considered the more original master (or masters) — the artist who is em nently successful in developing the large and complex theme of the Battle of the Gods and Giants, with its complicated encounters and subtle superimposition of planes, or the artist who contents himself with concentrating in vigorous and compact form themes of epic struggles clearly and ceremoniously presented (PL. 11; I, PL. 358). An extremely fragmentary metrical inscription has been taken by some to represent the signature of an Argive artist. No less surprising is Andreas Rumpf's attempt to ascribe these problematical sculptures to Endoios, an Attic artist of Ionian tendency.

Infinitely more convincing is the attribution to the Attic world of the pediment sculpture of the great Temple of Apollo. The reconstruction effected approximately between 520 and 510 B.C. was intended, it is known, to testify to the magnificence and moral preeminence of the exiled Attic noble family of the Alkmaionidai. Both the furious strength of the charging Athena in limestone and the severity, reserve, and authority of the solemn figures of the marble front (depicting Apollo in his chariot, accompanied by Leto, Artemis, and the Muses) are completely in accord with the traditional qualities of the Attic figural idiom.

If the great Athena Promachos in the Marmaria is Ionian or from the islands, the Treasury of the Athenians, on the other hand, presents data of extreme importance affirming the vigor and the power of renewal of Attic sculpture. The treasury is variously dated — in general, sometime between the late 6th century and the Battle of Marathon (490 B.C.). In any case, there is an unbridgeable gap between it and the harmonious and self-contained world of mature archaism apparent in the sculpture of the temple of the Alkmaionidai. Beneath an external conformity with the most characteristic features of the archaic period, the dynamism and force of the new artistic spirit are already eloquently proposed. What is left of the pediment is too fragmentary to permit tracing the lines of composition, but the metopes, in the imagination and skill with which the twisted and strained figures of the struggling heroes are drawn, represent the most perfect expression of the unceasing Attic search for appropriate rendering of bodies contorted and articulated in their every fiber. In this conveying of heroic exaltation and concentrated energy through the awesome mechanics of the tense human body, the sculptures of the Treasury of the Athenians represent the closest Attic parallel to the pediment sculpture of Aegina. The tension of certain figures, curved like taut bows, might even be compared to the roundness of the Attic cup: that is, a confining shape which determines and contains the maximum force of the human figure, yet allows full play for the imaginative artist.

Another problem — one of the most crucial in the study of ancient sculpture — is presented by the *Charioteer* (III, PL. 346), part of a Delphic votive group and perhaps the most famous and most beautiful bronze that has come down to us. Not even the great *Zeus* (or, according to some scholars, *Poseidon*; III, PL. 356) sometimes even preferred to it, can be judged on the same level. In truth, the *Zeus* is expansive by nature; remote from the viewer, he reveals himself in the great traditional gesture of condemnation and menace. Whereas nothing disturbs the inner concentration, the pensive reserve of the *Charioteer*, a mood captured in outlines of miraculous clarity. Beneath this surface calm there seethes an enigmatic vitality, and the *Charioteer* confronts the spectator with a compelling presence of magical power. This figure is a work of incomparable originality, without visible affinity or even distant relationship to the various recognizable groups of sculpture dating from the late archaic period. Several of the varied conjectures that have been made — such as the attempts to relate the work to the memorial monuments of Cyrene or to those of the Deinomenids recorded by Pausanias — become most unlikely when it is borne in mind that the *Charioteer* must have been part of a votive offering subsequently buried by a landslide and therefore lost to sight by Roman times. Also to be dismissed as unacceptable is the suggestion that it was an Attic work, for since the Attic is the area of Greek culture best known to modern times, such an amazing work of art would surely have elicited appreciable comment. F. Hampe's attempt to determine the origins of the *Charioteer* by recovering the name of a sculptor otherwise without artistic identity, that is, Sotadas of Thespiai, has not met with universal assent. His hypothesis has no merit beyond that of linking two facts which are, so far as is known, completely independent of each other.

One of the islands may be the source of a little statue of the peplos wearer (*peplophoros*), a remnant from the Marmaria, and possibly an acroterium (*akroterion*) of almost classic character. A Cycladic origin has been assigned to two monumental steles of Delphi: a very mutilated draped figure of a man, and an athlete refolding his chlamys, the latter a work of supreme rhythmical fluidity that displays a refined plastic sense in the subtly graduated planes of its relief.

Although the height of the classic period at Delphi is not sufficiently represented in what has come down to modern times, examples from the end of the 5th century are nevertheless remarkable. Thus in the tholos — an elaborate and sophisticated construction based upon the detailed mathematical calculations of Theodoros of Phokaia — there has survived part of the figural decoration (metopes with acroteria showing the war against the Amazons), with fluid and graceful figures in the Attic style. In the same tradition, a few decades later, was carved the acanthus-sheaf column, with the group of three dancing girls hold-

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

ing *kalathiskoi*, in which Ionian and Attic influences have been traced. Finally, G. Lippold has in this connection recalled the suspended figure motifs occurring in the work of Leochares.

It was Thessaly's traditional aim, many times attempted through the centuries, to dominate the sacred city of Delphi. This policy is attested by the most conspicuous of the votive offerings of the 4th century, of which sizable fragments remain: the exedra of Daochos, a Thessalian dynast who held the position of hieromnemon (sacred recorder) of Delphi. From this monument have survived a remarkable group of statues representing illustrious ancestors of the dedicant, apparently contemporaneous copies of a group erected in his own country at Pharsalos. The group is by tradition associated with the name of Lysippos (q.v.), and undoubtedly some of the statues preserved, such as the *Agias* (IX, PL. 219), reveal at least the immediate influence of the great master. Though some of the figures seem to indicate varied and unequal achievement, the *Agias* itself is in every way an original creation in the skillfulness of its design, the flowing lines of its contours, and its intense spiritual quality.

The latest impression obtainable from the remains of Delphi, near the end of the Hellenistic age, is of a resurgent classicism, evident in the reliefs of the monument of Aemilius Paulus and in the round altar depicting maidens hanging wreaths.

ARTISTS AND BIBLIOG. Locris. *Sculptors*. Menaichmos and Soidas (see below under *Aetolia*). – Phocis (for Delphi, see below). *Sculptors*. Epeios (Ἐπειός), son of Panopeus, identified also as an architect; the legendary creator of the Trojan Horse: xoanon of Hermes at Arbos — one also at Ainos? (W. Amelung, ThB, s.v., no. 1; G. Cressedi, EAA, s.v.). – Kalamis (q.v.). – Telephanes (see below under *Thessaly*). – Praxiteles (q.v.). – *Painters*. Aristeides (Ἀριστείδης) of Thebes (Aristeides the Younger), son of Nikomachos and perhaps nephew of Aristeides the Elder: Battle of the Persians, for Mnason, tyrant of Elateia, not earlier than 333 B.C. (for other works see ATTIC AND BOEOTIAN ART; Rumpf, MZ, pp. 126, 151; F. Magi, EAA, s.v., no. 2). – Theomnestos (Θεόμνηστος), recorded as a contemporary of Protogenes: heroes for Mnason of Elateia, ca. 330 B.C. (G. Lippold, RE, s.v.; ThB, s.v.). – Asklepiodoros (Ἀσκληπιόδωρος), Athenian (perhaps to be identified with bronzeworker of the same name), very skillful in rendering perspective, possibly a writer on this subject: 12 gods for Mnason of Elateia (B. Sauer, ThB, s.v., no. 2; Rumpf, MZ, p. 147; L. Forti, EAA, s.v., no. 1).

Delphi. *Architects*. Agamedes (Ἀγαμήδης) and Trophonios (Τροφώνιος), legendary characters from Boeotia (see ATTIC AND BOEOTIAN ART) or Arcadia (see PELOPONNESIAN ART): the earliest Temple of Apollo in stone (H. Thiersch, ThB, s.v. Agamedes; M. T. Marabini Moeus, EAA, s.v. Agamedes). – Pteras (Πτερᾶς), legendary artist (hero who gave his name to Aptera?): second Temple of Apollo, made solely of beeswax and birds' feathers (*pterinos*), hence perhaps the builder's name (C. Weickert, ThB, s.v.). – Theodoros (Θεόδωρος) of Phokaia, end of 5th cent. to beginning of 4th cent. B.C.: tholos in sanctuary of Athena Pronaia, and wrote a treatise on same (W. Züchner, ThB, no. 4; Lippold, GP, p. 231). – Xenodoros (Ξενόδωρος): between 353 and 343 B.C. supervised reconstruction of Temple of Apollo, which was destroyed in 373 B.C. (W. B. Dinsmoor, The Architecture of Ancient Greece, London, 1950, p. 217 ff.). – Spintharos (Σπίνθαρος) of Corinth: toward middle of 4th cent. B.C. directed reconstruction of Temple of Apollo (C. Weickert, ThB, s.v.). – Kallinos (Καλλῖνος): collaborated as head architect (*hyperarchitekton*) in reconstruction of Temple of Apollo, between 343 and 340 B.C., as revealed in the expense accounts (C. Weickert, ThB, s.v.). – Agathon (Ἀγάθων), son of Neoteles, perhaps a native of Thourioi, second half of 4th cent.: completed restoration of Temple of Apollo (342–330 B.C.), of which he was considered the architect (H. Thiersch, ThB, s.v.; G. A. Mansuelli, EAA, s.v., no. 2). – Philon (Φίλων), son of Exekestides, from Eleusis; architectural theoretician and orator, lived in the second half of 4th cent. B.C.: restorations of a silver crater and of a golden vessel for lustral water (*perirrhanterion*), an offering from Croesus; uncertain attribution of armory (*hoplotheke*) and of stoa of the gymnasium (for other works see ATTIC AND BOEOTIAN ART; E. Fabricius, RE, s.v., no. 56). – Euphorbos (Εὔφορβος), according to expense accounts of 341–340 B.C., worked on the synedrion, Temple of Demeter, and the artificial baths (M. Schede, ThB, s.v.; G. A. Mansuelli, EAA, s.v.).

*Sculptors active at Delphi 7th and 6th centuries* B.C. [Poly]medes ([Πολυ]μέδης), or [Aga]medes?, of Argos, lived ca. 600 B.C.: *Kleobis* and *Biton*, found near Treasury of the Athenians (Lippold, GP, p. 25; J. Marcadé, Recueil des signatures de sculptures grecs, I, Paris, 1953, no. 115). – Charopinos (Χαροπῖνος) of Paros, second half of 6th cent.: may have produced two works on which his name is preserved in inscriptions, an Ionic votive column and a pedestal with the feet of a kouros (what seems a disproportionate torso has sometimes been associated with the latter work). Other attributions: southern and western friezes of Treasury of the Siphnians (Lippold, GP, p. 68; J. Marcadé, ibid., no. 21; L. Guerrini, EAA, s.v). – Domis (Δόμις), of unknown origin, hypothetically identified with Somis, lived in the second half of 6th cent.: signature relating to votive offering of Theugenes of Poteidaia (Lippold, GP, p. 87, note 13; J. Marcadé, ibid., no. 29; L. Guerrini, EAA, s.v.).

*Sculptors active at Delphi 5th cent.* B.C.: Hageladas (Ἀγελάδας), Ageladas (Ἀγελάδας), Hagelaidas (Ἀγελᾴδας), of Argos, lived between 520 and 480; according to sources was master of Polykleitos, Myron, and Phidias, but is also dated ca. 432 B.C.: bronze offering from the Tarentines after victory over Messapians, remains of the base of which are preserved together with the inscription (for other works see PELOPONNESIAN ART; Lippold, GP, p. 88 ff.; P. Orlandini, EAA, s.v.). – Chionis (Χίονις), or Chion (Χίων), of Corinth, lived at beginning of 5th cent.: *Artemis* and *Athena*, from group depicting the struggle of Apollo and Herakles for the tripod, offered by the Phocians after victory (ca. 485 B.C.) over the Thessalians (W. Amelung, ThB, s.v. Chion; Lippold, GP, p. 87; G. Carettoni, EAA, s.v. Chionis). – On this Phocian offering, two other Corinthian artists who worked in bronze collaborated: Amyklaios (Ἀμυκλαῖος; W. Amelung, ThB, s.v.; P. Orlandini, EAA, s.v.) and Diyllos (Δίυλλος) worked on the *Leto*, *Apollo*, and *Herakles* (W. Amelung, ThB, s.v., no. 1; L. Guerrini, EAA, s.v.). – Theopropos (Θεοπρόπος) of Aegina, active at beginning of 5th cent.: bronze bull, dedicated by the inhabitants of Kerkyra (Corfu) at entrance of sacred precinct, from whose base fragments have been preserved (see PELOPONNESIAN ART; Lippold, GP, p. 98; J. Marcadé, ibid., no. 106). – Aristomedon (Ἀριστομέδων) of Argos, lived at beginning of 5th cent.: group offered by the Phocians after victory over the Thessalians, included Apollo, the seer Tellias, Phokos, Phocian chiefs and heroes, to which a fragmentary base remaining (with inscription remade in 4th cent. B.C.) may be referred (Lippold, GP, p. 89, note 6; P. Orlandini, EAA, s.v.). – [D]iop[eith]es ([Δ]ιοπ-[εἰθ]ης), Attic sculptor working before 480: signed base belonging to a figure of Apollo with doe (for other signatures see ATTIC AND BOEOTIAN ART; Lippold, GP, p. 108; J. Marcadé, ibid., nos. 26–28; L. Guerrini, EAA, s.v., no. 1). – Onatas (Ὀνάτας) of Aegina, son and probably pupil of Mikon; active from before 480 until at least 467: warriors surrounding fallen King Opis, group offered by the Tarentines after victory over the Peucetians; doubtful fragmentary inscription preserved (for other works see PELOPONNESIAN ART; P. Amandry, BCH, LXXIII, 1949, p. 447 ff.; Lippold, GP, pp. 98, 102 ff.). – Kalynthos (Κάλυνθος), a name also erroneously interpreted as Kallisteles, Kalamis, or Kallon; possibly from Aegina and active ca. 470; collaborated with Onatas on the Tarentine group (ThB, s.v.; C. Picard, II, p. 220; Lippold, GP, p. 98). – Bion (Βίων), son of Diodoros of Miletos: a statue base with his signature has been associated with the *Nike and Golden Tripod*, a work of Bion offered by Gelon of Syracuse after victory of Himera in 480 (Lippold, GP, p. 122; J. Marcadé, ibid., no. 9; M. T. Amorelli, EAA, s.v., no. 3). – Pythagoras (Πυθαγόρας) of Samos, or of Rhegion, active between 480 and 448: statue of wrestlers, or *pankratiastes* (see GREEK ART, WESTERN; Lippold, GP, p. 124 ff.). – Kalamis (q.v.). – Sotadas (Σόταδας) of Thespiai, first half of 5th cent.: signed base from supporting wall of northern terrace of Temple of Apollo, therefore considered to belong to the offering of Polyzalos (M. Bieber, ThB, s.v.; Lippold, GP, p. 113; J. Marcadé, ibid., no. 102). – Hypatodoros (Ὑπατόδωρος), or Hekatodoros(?) (Ἑκατόδωρος), of Thebes, active probably ca. mid-5th cent.: *Seven against Thebes*, in collaboration with Aristogeiton, offering of the Argives after victory of Oinoe (460 or 456 B.C.), from which fragments of the base are preserved; fragmentary base, signed together with Aristogeiton, which supported the offering of an inhabitant of Orchomenos, dated ca. 445 B.C. (see also ATTIC AND BOEOTIAN ART; Lippold, GP, p. 112; J. Marcadé, ibid., no. 38). – Aristogeiton (Ἀριστογείτων) of Thebes, second quarter of 5th cent.: *Seven against Thebes*, described above, and fragmentary signed base, subsequently lost; both works executed in collaboration with Hypatodoros (Lippold, GP, p. 112; J. Marcadé, ibid., no. 8; P. Orlandini, EAA, s.v.). – Myron (q.v.). – Phidias (q.v.). – Amphion (Ἀμφίων) of Knossos, son of Akestor and pupil of Ptolichos, active ca. mid-5th cent.: offering of Cyrene, showing the founders (*oikistes*) Battos and Libye in a quadriga (Lippold, GP, p. 176; M. T. Amorelli, EAA, s.v.). – Kresilas (Κρησίλας) of Kydonia, active in the second half of 5th cent.: signature in Ionic dialect and characters, dating from 430–420 B.C. (for other works see GREEK ART, AEGEAN; Lippold, GP, p. 172 ff.; P. Orlandini, Kresilas, MemLinc, ser. VIII, vol. IV, 1952, p. 275 ff.; J. Marcadé, ibid., nos. 62–64). – Phradmon (Φράδμων) of Argos, probably lived in the second half of 5th cent.: the athlete Pythodeles

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

(or Pithodoros), of which the base with part of signature remains. Attributed work: Sisyphos I of the Daochos group (see also PELOPONNESIAN ART; Lippold, GP, p. 169 ff.; J. Marcadé, ibid., nos. 87–88). – Dorotheos (Δωρόθεος) of Argos, second half of 5th cent.: inscription with doubtful restoration of the name (see PELOPONNESIAN ART; Lippold, GP, p. 170; J. Marcadé, ibid., nos. 30–31). – Patrokles (Πατροκλῆς) of Sikyon, perhaps the son of Naukydes (brother of Polykleitos), father of Daidalos and Naukydes the Younger, or of Polykleitos the Architect: ten statues of sea captains (*nauarchoi*), part of Spartan offering dedicated by Lysandros (Lysander) after victory of Aigospotamoi (405 B.C.), of which a fragment of the base remains (G. Lippold, RE, s.v., no. 8; Lippold, GP, p. 217). – Kanachos (Κάναχος) of Sikyon, pupil of Polykleitos: also collaborated on Spartan offering of Lysandros (see PELOPONNESIAN ART; ThB, s.v., no. 2; Lippold, GP, p. 216). – Other collaborators for the same offering: Alypos (Ἄλυπος) of Sikyon, pupil of Naukydes: seven statues of nauarchoi, of which only a base in two blocks remains, with a signature (for other works see PELOPONNESIAN ART; J. Marcadé, ibid., no. 3; P. Orlandini, EAA, s.v.). Pison (Πίσων) of Kalaureia, disciple of Amphion (of Knossos?) and master of Damokritos of Sikyon: statue of the soothsayer Agias (G. Lippold, ThB, s.v.; G. Lippold, RE, s.v.). Tisandros (Τίσανδρος), or Teisandros (Τείσανδρος): group of eleven nauarchoi, of which a signed base remains (M. Bieber, ThB, s.v. Tisandros; J. Marcadé, ibid., no. 104). Dameas (Δαμέας) of Kleitor, school of Polykleitos: statues of Artemis, Poseidon, and Lysandros, with fragments of the base of the last-named remaining but without signature (W. Amelung, ThB, s.v., no. 2; L. Guerrini, EA, s.v., no. 2). Athanodoros (Ἀθανόδωρος) of Kleitor, school of Polykleitos: statues of Zeus and Apollo (W. Amelung, ThB, s.v., no. 2; M. T. Amorelli, EAA, s.v., no. 2). Theokosmos (Θεόκοσμος) of Megara, probably father or grandfather of Kallikles: votive offering of a Hermon (see PELOPONNESIAN ART; M. Bieber, ThB, s.v.). Antiphanes (Ἀντιφάνης) of Argos, pupil of Perikleitos (or Periklytos) and master (or disciple?) of Kleon of Sikyon: statues of the Dioskouroi; also executed a bronze horse (Trojan Horse?) for Argive donation after victory over the Spartans in Thyrea (414 B.C.?), from which the base remains with a dedication; also collaborated on Argive offering in memory of alliance with Thebes for founding of Messene (370–369 B.C.), contributing statues of Danae, princess of Argos, and her son Perseus, of which the signed base remains, as well as on the offering given by the Tegeans (or by all the Arcadians?) for victory over the Spartans (369 B.C.), with statues of Elatos, Apheidas, and Erasos (or Arkas?), of which two signed bases remain (Lippold, GP, p. 216 ff., p. 247; J. Marcadé, ibid., nos. 5–6; D. Mustilli, EAA, s.v.). Akron (Ἄκρων), probably of Selinous, son of Praton, active toward end of 5th cent.: signed base that supported two statues, perhaps Asklepios and Hygieia (Lippold, GP, p. 211; J. Marcadé, ibid., no. 2; L. Guerrini, EAA, s.v.). – Nikodamos (Νικόδαμος) of Mainalos, active ca. 400 B.C.: offering of Hetairichos, of which the inscription on the base remains (for other works see PELOPONNESIAN ART; Lippold, GP, p. 218; J. Marcadé, ibid., no. 84). – Trito[. . .] (Τριτο[. . .]), perhaps a sculptor of the 5th cent.: name in fragmentary inscription on a block that may have supported a Boeotian offering (J. Marcadé, ibid., no. 108). – [. . .]nio ([. . .]νιο) of Thebes, probably of the 5th cent.: fragmentary signature on a base showing traces of statues it once supported (J. Marcadé, ibid., no. 116).

*Sculptors active at Delphi 4th cent.* B.C. A[g]athon ('A[γ]άθων), probably a sculptor of the end of 5th or the first half of 4th cent.: fragmentary signature on a base bearing the impression of a group in bronze, perhaps Artemis and Kallisto (J. Marcadé, ibid., no. 1; L. Guerrini, EAA, s.v. no. 3). – [Andr?]on ([Ἄνδρ?]ον) of Thebes, active perhaps in the first decade of 4th cent.: fragmentary signature on base (J. Marcadé, ibid., no. 117). – Daidalos (Δαίδαλος) of Sikyon, son of Patrokles, active first half of 4th cent.: base signed and presumed part of statue of a boxer (Glaukon, son of Taureas?), ca. 400 B.C.; statues of Nike (recognized in a bronze at Lyons) and Arkas for anathema (votive offering) of the Tegeans, which stood before the portico of Lysandros, the base remaining (for other works see PELOPONNESIAN ART; Lippold, GP, p. 217; J. Marcadé, ibid., nos. 22–24; G. Cressedi, EAA, s.v. no. 1). – Pausanias (Παυσανίας) of Apollonia (Illyria): huge statues of Apollo and Kallisto for Tegean offering, of which the common inscription remains (Lippold, GP, p. 247; J. Marcadé, ibid., no. 86). – Samolas (Σαμόλας), an Arcadian: images of Triphylos and Azan, also for the Tegean anathema, of which the inscribed bases remain (J. Marcadé, ibid., no. 92). – Kleon (Κλέων) of Sikyon, pupil of Antiphanes of Argos, active first half of 4th cent.: signed base that belonged to statue dedicated by Spartan ruler Pausanias to his son Agesipolis, who died in 380 B.C., with dedicatory epigram restored ca. 150 B.C. (for other works see PELOPONNESIAN ART; Lippold, GP, p. 217; J. Marcadé, ibid., nos. 60–61). – Praxias (Πραξίας), son of Lysimachos, Athenian: pediments of Temple of Apollo (ca. 366 B.C.), with Apollo, Leto, and the Muses on the east; Dionysos, the Thyiades, and the setting of Helios on the west; sculpture groups completed by Androsthenes (for other works see ATTIC AND BOEOTIAN ART; Lippold, GP, p. 243; J. Marcadé, op. cit., II, 1957, nos. 110–11). – Praxiteles (q.v.). – Herakleidas (Ἡρακλείδας) of Atrax: offering from the people of Pharsalos, with Achilles on horseback and Patroklos, to which an inscribed base dated 344 (or 363) has been assigned (Lippold, GP, p. 248; J. Marcadé, op. cit., I, 1953, no. 35; M. B. Marzani, EAA, s.v., no. 2). – Hippokrates (Ἱπποκράτης) of Atrax, collaborated on Pharsalian donation (J. Marcadé, ibid., no. 37). – Satyros (Σάτυρος), son of Isotimos (or of Apollodoros?) and father of Lykos; architect and sculptor of Paros, author of treatise on Mausoleion of Halikarnassos and perhaps of one about stones: bronze statues of Idrieus and Ada, Carian dynasts, dedicated by the Milesians to Apollo (346–344; possibly reproduced on two reliefs from Tegea and Halikarnassos), of which the base remains (for other works see GREEK ART, AEGEAN; Lippold, GP, p. 254; J. Marcadé, ibid., no. 93; C. Picard, IV, p. 70 ff.). – Androsthenes (Ἀνδροσθένης), an Athenian, pupil of Eukadmos, active ca. 335–325: completed pediments of Temple of Apollo and perhaps was the sole artist responsible for western side (Lippold, GP, p 244; M. T. Amorelli, EAA, s.v.). – Lysippos (q.v.). – Leochares (Λεωχάρης) of Athens: *Alexander Attacked by a Lion*, carved for Krateros in collaboration with Lysippos ca. 320–315 (for other works see ATTIC AND BOEOTIAN ART; Lippold, GP, p. 268 ff.; C. Picard, IV, p. 22 ff.).

*Painters active at Delphi*: Polygnotos (q.v.). – Timagoras (Τιμαγόρας), from Chalkis, active ca. mid-5th cent., won a victory over Panainos in painting competition at Pythian games (ThB, s.v.; G. Lippold, RE, s.v., no. 6). – Panainos (Πάναινος) of Athens, lived ca. 450 B.C., took part in painting competition at Pythian games (see ATTIC AND BOEOTIAN ART; F. von Lorentz, ThB, s.v.; Rumpf, MZ, p. 95). – Aristokleidas (Ἀριστοκλείδας; to be identified with Aristokydes?); active ca. mid-4th cent. B.C. in the Temple of Apollo (B. Sauer, ThB, s.v.; L. Forti, EAA, s.v.). – *Metalworkers active at Delphi*: Glaukos (Γλαῦκος) of Chios, active probably between 7th and 6th cent., but sometimes assigned to early 7th cent.; held to be the inventor of iron soldering: silver crater on iron support, offering of Alyattes, King of Lydia (Lippold, GP, p. 64; EAA, s.v.). – Theodoros (Θεόδωρος) of Samos, son of Telekles and brother of Rhoikos, or son of Rhoikos and brother of Telekles; sculptor and possibly an architect, active in the first half of 6th cent.: silver crater, offering of Croesus (for other works see GREEK ART, EASTERN; M. Bieber, ThB, s.v.; Lippold, GP, p. 58 ff.).

AETOLIA AND ACARNANIA. Aetolia is another poor and mountainous region that made no notable contribution to the artistic patrimony of Greece. The period witnessing the most intense political activity in this region, that of the Aetolian League, corresponded in fact to a time of meager creative activity throughout Greece. As is well known, during the Hellenistic age innovations in artistic endeavor occurred mostly in the east, in those large rich countries lately conquered, where all the vital energies of the Greeks appeared to be concentrated.

Some fortified cities such as Pleuron and, particularly, Oiniadai still preserve imposing walls and other structures, with most unusual arched doors; but the only important contribution made by the region consists of the large terra cottas of Thermon and Kalydon (Calydon). The latter city, seat of the ruler Oineus, which is famous for the themes of the great boar hunt and the struggle of Herakles against the river Acheloos, has yielded extensive remains of the Temple of Artemis Laphria (FIG. 99), of which it is possible to detect at least three restorations. The temple decoration includes painted metopes, antefixes with female faces, and terra-cotta acroteria of great beauty in the pure Corinthian tradition; the faces of the antefixes and the acroterial sphinxes (PL. 41) are, indeed, among the most notable examples of terra-cotta modeling from the late 7th century through the first decades of the 6th century. Faint traces remain of a single carved metope: the date suggested by the discoverers — 4th century B.C. — is merely provisional; in any case, this metope was assuredly part of a later restoration, of which no other traces remain. The painted metopes, in an extremely fragmentary state, evidence an alternation of complex mythological schemes (e.g., Herakles and the boar), with great Gorgon faces, an arrangement somewhat similar to that at Thermon. From Kalydon also are remains of an unusual heroön displaying friezes and architectural motifs of Hellenistic type, completed by a series of busts set between shields that seems to

Kalydon, plan of the Laphrion: (*a*) Temple A; (*b*) Temple of Artemis; (*c*) apsidal building; (*d*) exedra; (*e*) propylon; (*f*) great stoa; (*g*) templelike structure; (*h*) Sacred Way; (*i*) city walls; (*j*) gates; (*k*) heroön (Leonteion); (*l*) necropolis; (*m*) heroön (*from E. Dyggve, 1948*).

initiate the classicistic tradition of copying famous originals. Among the mostly anonymous or doubtful faces appears that of Meleager, the central figure of the Calydonian hunt, adopting the type traditionally assigned to Skopas.

Thermon, with its great Temple of Apollo Thermios (FIG. 100), decorated with superb painted metopes (PL. 39; I, PL. 336) and various terra cottas, has been judged by some as less purely Corinthian than the Temple of Artemis at Kalydon. Even if some of the faces of antefixes restored at various times have a crude local character, it is certain that the metopes and the facial types present a true reflection of Corinthian art. At Thermon the antefixes (PL. 42) are even more varied and vigorous than at Kalydon. From faces of Daedalic character, possibly from the end of the 7th century, they evolve into types — already almost classical — of the mid-5th century. Moreover, alongside the usual female faces, there appears in varying versions a noble bearded face that must be Apollo, lord of the temple, as well as the face of a satyr of tremendous vitality. The painted metopes, which may be compared with the figures of archaic Corinthian vases, constitute the most complete and authoritative data yet discovered about ancient painting. As at Kalydon, large winking Gorgon heads alternate in the large square spaces with mythological scenes apparently unrelated to one another: Perseus flying with the magic pouch (*kybisis*), a hunter (perhaps Herakles or Orion), Chelidon, and Philomela bending over little Itys, who is to be sacrificed in vengeance. The large bodies with angular, simplified outlines are most impressive in their limpid clarity, and the color so freely applied confirms the impression of freshness and joyous abandon common to all Corinthian art forms.

Acarnania, another region of peripheral civilization, also manifests vague and scanty artistic traditions. An isolated monument from the area is the stele with a lyre player, from Anaktorion (Athens, Nat. Mus.), a weak sculpture of linear character from the beginning of the 5th century B.C. One of the most important sites in Acarnania is Stratos (Suvovigli), notable for monumental remains of the great walls and of the Temple of Zeus (FIG. 102), a Doric hekatompedon with columns partially fluted, dating from about the mid-4th century, the time of maximum expansion and importance for the Aetolian League. In contrast to the splendor indicated by the temple vestiges is a surprising lack of art objects, for no sculpture, not even minor votive offerings, has been found.

Aktion (Actium), at the mouth of the Gulf of Ambrakia, now best known as the scene of the victory of Augustus over Antony and Cleopatra, had long been famous for its venerable Temple of Apollo, which later generated the imperial devotion to Apollo Palatinus. From the point of view of the art historian, the most important find on this site was that of two large torsos of kouroi (Louvre), evidently works of importance, concerning which the debate continues as to whether they show a Corinthian character or the influence of island centers.

ARTISTS AND BIBLIOG. Aetolia. *Sculptors.* Dipoinos (Δίποινος) and Skyllis (Σκύλλις), Cretan brothers, probably of Gortyna; pupils or sons of Daidalos and teachers of Angelion and Tektaios, Theokles, Klearchos, Medon, and Dorykleidas; worked in Aetolia (7th or 6th cent.); most ancient antefix at Thermon attributed to them (see GREEK ART, AEGEAN; W. Amelung, ThB, s.v. Dipoinos; M. Bieber, ThB, s.v. Skyllis; Lippold, GP, p. 23; G. Cressedi, EAA, s.v. Dipoinos). – Menaichmos (Μέναιχμος) and Soidas (Σοΐδας), both of Naupaktos, active in the first half of 5th cent.: image of Artemis Laphria, executed for Kalydon ca. 460–450 B.C., known through copies and coins (Lippold, GP, p. 113 ff.). – Lysippos (q.v.).

EPIRUS AND ILLYRIA. Farther north the centers of Hellenic culture seem progressively more isolated and distant from one another. According to tradition, Ambrakia possessed a very ancient effigy ascribed to Dipoinos (Pliny the Elder, *Naturalis Historia*, xxxvi, 14, 9). The earliest examples of sculpture that have come down to us, however, are a very primitive small bronze figure (perhaps the handle of a hydria) from Agrinion and the statuette of Zeus the Thunderer from Ambrakia (Athens, Nat. Mus.), a vigorous work of a most unusual character. As more precise and convincing comparisons are lacking, the suggestion may be accepted that these works are vaguely related to the figures of combatants on the pediment of the temple at Corfu (PL. 44), mainly because of the angular forms of the statuette, with its hard and simplified outlines. Recent discoveries have brought to light attractive votive terra cottas of Corinthian origin, among which are some small, seated sphinxes of a type akin to that of the Melian reliefs. Ambrakia must have enjoyed a period of exceptional splendor during the reign of Pyrrhos, at the beginning of the 2d century B.C. It is known that Pyrrhos, in the tradition of the Macedonian kings, attempted to gather in his capital city a number of famous works of art. This period of magnificence was not protracted, however, and subsequently a group of Muses of Ambrakia was transported to Rome by Fulvius Nobilior and there dedicated in the Temple of Hercules. Afterward, Ambrakia was depopulated in favor of the new city Nikopolis, founded by Augustus after his victory at Actium.

Thermon, plan of Temple of Apollo, with underlying megaron B (*from AD, II, pl. 49*).

The region has yielded few examples of archaic sculpture, and these are almost unidentifiable: a very mutilated torso of a kouros from Durrës, Albania, a draped torso from Apollonia, a fragmentary kore in Dodona. From the city of Epidamnos,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

corresponding perhaps to the modern Durrës, there remains a broken fragment of the sculptural decoration of a treasury of Olympia. Nevertheless (and in this respect the area resembles others in which the vital artistic impulse seems to have expired toward the end of the ancient world), precious objects in other media have frequently been found in Epirus, bronze examples being especially noteworthy. An incomparable series has been found at Dodona, as well as a remarkable group at Paramythia. Here also the general characteristics of style consistently conform to the Corinthian mode. One of the most ancient bronzes of Epirus (known only through a sketch), a mirror support in the form of a maiden, is purely Corinthian, as is the greater part of the work found at Dodona. Among the bronzes of Paramythia, most of them of the Hellenistic age, one of the finest must have been the lost *Seilenos the Hammerer*, which — to judge from the sketches — seems to have been of different quality from the other known examples and which, on the basis of its figural scheme and probable date, may be related to the Epimetheos (or Hephaistos) of Dumbarton Oaks (PL. 70). The predominance of Corinthian influence may also be seen in the fact that the most notable of the rare ceramics of the region are the Corinthian fragments of Apollonia. The terra-cotta antefix of Apollonia, its face betraying a lingering Daedalic character, is also Corinthian. It is more difficult, however, to discern the influence of central Greece in the fragment of a frieze with warriors, which has sharp, provincial forms.

One of the most important factors in the development of sculpture on the shores of Epirus, at least during the 5th and 4th centuries B.C., may have been the introduction of the rich and exuberant forms fashionable at Taras. This influence has been recognized in the steles of Durrës and Apollonia, and particularly in an elaborate acroterium with maidens among leafy scrolls (Louvre). With regard to the contacts between this northern extremity of Greece and southern Italy and Sicily, it should be remembered that as early as the 6th century one of the rare artists known from this region, Polystratos of Ambrakia, carved a famous statue of the tyrant Phalaris of Akragas (Agrigento). Offshoots of Hellenic influence are found in the interior as far as the shores of Lychnitis (Lake of Ohrid), where the princely tombs of Trebenište have yielded a wealth of refined Corinthian bronzes, especially tripods and large craters with Gorgons and horsemen of a type associated with Dodona in particular. The bronzes and other precious objects of Duvanli (Duvanly) show a strong infiltration of barbarian art, while importation of Attic vases confirms the artistic aspirations of the region.

The remote sanctuary of Dodona requires separate description. As at other sites in Epirus, the relatively small yield of monumental and sculptural remains from Dodona is compensated by bronzes of great interest, ranging from late Geometric statuettes, tripods, and lebetes to free imaginative creations of the mid-4th century B.C. Certain of the Dodona bronzes, such as the warrior in Berlin, *Zeus the Thunderer*, and the small horseman of Athens, are considered among the most significant examples of this metal sculpture in the entire Hellenic territory. Even when undoubted masterpieces are excluded from consideration, the general artistic level of these statuettes and reliefs is astonishingly high. Once more the influence of Corinth is pronounced; to the sculptural traditions of this city may be ascribed relief plates from shields and mirrors that carry on, until the beginning of the 5th century, traits of the splendid series recovered at Olympia. Corinthian influence is revealed in tender, vibrant statuettes of animals and human beings, rendered with particular limpidity. The stag accompanying Apollo in certain statues turns round, almost as if to suggest a more intense spiritual relationship with the god, who holds the animal with his great hand; also worthy of note is a little horseman, evidently part of the decoration of a crater of the type found at Trebenište. A small figure of Apollo (Louvre, no. 140), as if to confirm the theory of Corinthian influence, preserves the dedications of a Corinthian sculptor, Ethymokleidas. Later mirrors, helmet adornments with relief groups, and late classical statuettes, such as the seated maenad and the furious maenad types, are most likely Corinthian as well. Ernst Langlotz is not alone in assigning to Sparta the strange little figure, generally described as a running maiden, who wears the short tunic of Artemis or Atalante (PL. 45). Certainly in the running maiden, with her compact and firmly outlined body, there seems evident a more concentrated vitality than in the re-

Stratos, reconstruction of Temple of Zeus: (*a*) Façade; (*b*) plan (*from F. Courby and C. Picard, 1924*).

laxed mood conveyed by the serene and graceful Corinthian figures. Although this running maiden from Dodona differs in temperament from the Berlin Artemis (no. 7971) and from the running maiden of the British Museum (even though the latter resembles her so much in formal composition), nevertheless — in her neat proportions, round and clearly outlined face, and expression of moral energy — she is akin to the Maenad of Tetovo, another notable Peloponnesian import found in the Illyrian hinterland.

Recent excavations, continuing to add bronzes of interest and of exceptional quality, have brought to light the fragment of a protoma of a gryphon in beaten metal, from a crater of eastern character like those found at Delphi and Perachora; the quite singular Zeus in combat, with tightly curled locks, almost in imitation of the archaic style; and an unusual banqueter, whose soft and languid structure recalls Ionic style. A superb reclining bearded banqueter lately acquired by the British Museum is now generally believed to have come from Dodona (I, PL. 350; place of origin erroneously given as Ruvo).

ARTISTS AND BIBLIOG. Epirus. *Sculptors*. Dipoinos (Δίποινος) and Skyllis (Σκύλλις): one or more statues at Ambrakia (see above under *Aetolia*). – Polystratos (Πολύστρατος) of Ambrakia, active ca. mid-6th cent. B.C. IONIAN ISLANDS (Heptanesos). The islands of the Heptanesos, although remaining under the general influence of the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

predominant Corinthian style, nevertheless revealed some independent characteristics and a marked individuality of style within historic times. Zakynthos (Zante), the most southerly island of the Ionian group, is also the least thoroughly explored archaeologically. The most representative examples so far are some small Geometric bronzes, including a warrior with a crested helmet, which is of a schematic and unarticulated structure and resembles the Geometric bronzes of Olympia.

Kephallenia has yielded Mycenaean remains, tholos tombs cut into the living rock in the locality of Mazarakata, and abundant finds of pottery. The classical age is sparsely represented, except for imposing circles of walls such as those of Same. There have also been found an archaic capital and fragments of Corinthian pottery (*BCH*, LXXXII, 1958, p. 732). The ancient monuments and other finds at Leukas are insignificant, in spite of determined topographical explorations conducted there by W. Dörpfeld, who wished to rediscover on this site the Ithaca of the Homeric poems.

*Ithaca*. After decades of long and dogged discussion concerning the identification of the island of Odysseus, English explorations have produced data sufficiently convincing for even the most scrupulous consciences. Like the isle described in the Homeric poems, Ithaca, one of the smallest of the Ionian Islands, is rocky and wind-blown but has good landing places. Remains of Mycenaean buildings have allowed scholars to determine the site of the palace of the island rulers. A late terra-cotta pinax with a face carved in relief and the name of Odysseus confirms a continuing cult of the local hero.

Abundant deposits of pottery and bronzes, at least for the period from the 8th to the 6th century B.C., have assured Ithaca, among all the Ionian Islands, a position of exceptional archaeological importance. The two most important sites as yet explored on the island — the shrine of Mt. Aetos and Polis, with its grotto half filled by sea water — have yielded finds of great interest, particularly bronze tripods and large quantities of a very refined type of pottery. No other Ionian center, and possibly no other Greek center (except Perachora), has offered such important data regarding Corinthian ceramics. The sizable deposits of Aetos and Polis support the assumption that Corinthian products arrived on the island in a continual flow from the mid-9th until the early 6th century B.C. Great importance has been attached to a series of large Geometric and sub-Geometric vases rarely found elsewhere. A fragmentary crater from Aetos, of certain Corinthian origin, apparently places within the sphere of the Corinthian industry at least the prototypes of the well-known Syracusan craters that had been provisionally assigned to the island centers or to Argos.

A notable proto-Corinthian artist, the Aetos Painter, has derived his identity from two small kotylai of Ithaca. Other vases and fragments found in the Aetos shrine, particularly the large and exquisite conical oinochoe with a horse's head on the bottom, have come to be regarded as classics of proto-Corinthian painting (E. Buschor, *Griechische Vasen*, Munich, 1940, p. 30). Among the numerous significant examples should be mentioned the Corinthian kotyle displaying one of the oldest certain representations of the Muses.

Corinth, in spite of its decided predominance in the pottery market, was not the exclusive source of imported art objects in Ithaca; in the deposits at Aetos, large Cretan vases, vases from the islands, and even East Greek fragments (Rhodes) have been found. In addition to these imported wares, there arose in Ithaca in the 7th century a local production of remarkable artistic quality that, while evidently inspired by the Corinthian ceramics, showed much independence in the forms and decorative schemes adopted. Some scholars have detected Cycladic influence in the decorative motifs, which are larger and arranged in free and inventive designs, in some respects contrasting with the limpid, restrained, and delicately finished style of the proto-Corinthian production. Apparently, the ceramic artist Kalikleas should be assigned to this workshop; in a non-Corinthian dialect he signed a vase of the so-called "candlestick" type, commonly found in these deposits. The flow of imported and independent local products seems to desist abruptly in the mid-6th century B.C. One small bronze perhaps of later date should be noted, a little goat standing on a bronze supporting rod (from a tripod?); this may belong to the second half of the 6th century but does not bear comparison in artistic quality with the series of small Geometric and sub-Geometric horses.

*Kerkyra* (Corfu). The exploration of Corfu, which has been both intense and sporadic, has revealed monuments of exceptional interest that are, however, extremely isolated and difficult to relate to one another. The island, which may be identified with the legendary Scheria of the Phaeacians, has yielded very sparse Mycenaean remains. On the other hand, fine testimony of Hellenistic Kerkyra is offered by three splendid temples that have been fully explored, the two at Monrepos and the great Temple of Artemis at Kardaki with the famous sculpture of the pediment. These are outstanding examples from a general architectural point of view because of their refinement of forms, the introduction of unusual decorative elements, and the structural anomalies that have often led observers to associate them with the more unconventional buildings of Sicily and southern Italy, in particular with the "Basilica" of Paestum (the Greek Poseidonia; I, PL. 333).

The architectural terra cottas of the most ancient temple of Monrepos date from the beginning of the 6th century B.C., and although they present some points of resemblance with the older examples of Thermon, they also reveal a remarkable individuality. The wide bands, painted and carved in relief, offer singular examples of new and refined decorative schemes. The antefixes show female heads or Gorgon heads between pairs of facing lions. The finest sculpture of the temple is found in the lion heads of the cornice, modeled with a notable combination of vigor and delicacy. Here, as in the large lion couchant of the cenotaph of Menekrates (dated by inscription ca. 600 B.C.; PL. 43), one may recognize the continuance of traditional proto-Corinthian forms rather than the adoption of the new type common to Corinthian painting of the time.

At Kardaki, the pediment sculpture of the great Temple of Artemis represents not only the most important and most complete example of Corinthian sculpture but also one of the most remarkable examples of archaic temple sculpture, illustrating that strange fondness for monumental figures which is attested by the colossal kouroi in late archaic style, for instance, those of Samos and Sounion. In its dimensions alone and in its use of marble, the pediment was an innovation and marked an uncommon advance beyond the normal evolution of this artistic form. Dominating the group at the center is an immense Gorgon in high relief, flanked by panthers couchant (I, PL. 343); at either end are battle scenes — a gigantomachy (PL. 44) and an Ilioupersis, with a seated Priam threatened by the lance of Neoptolemos. In this fragmentary and disjointed figural scheme, some scholars have detected the primitive quality of an age in which it was not yet necessary to present a single sustained narrative. According to this viewpoint, the full Gorgon figure is an outgrowth of the primitive Gorgon head that, set within a medallion, decorates the most ancient pediments. It is hardly necessary to point out that the Gorgon in this monumental representation is goddess of nature and ruler of the animal world and is simply another form of Artemis, who reigned absolute in the religious world of Kerkyra. This plan of disjointed narrative, in which story episodes alternate with static presences of animals or monsters, was commonly adopted in Corinthian vase painting. An extreme example is an aryballos (Paris, Bib. Nat.) on which the Trojan Horse — from which are emerging the Greek warriors in battle array — is placed as a sort of pendant beside an enormous seated panther.

As for the pediment of the Kardaki temple, it is not possible to discount entirely a narrative continuity in the three great scenes represented. Although some scholars consider the central group to be merely a glorification of the Gorgon as goddess of nature, ruling over her children and the animal world, others hold that the young hero to the right is not her son Chrysaor but her slayer Perseus about to attack. Moreover, in accordance with the customary juxtaposition of events that in reality occurred consecutively, Pegasos (who sprang from the blood of

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

the Gorgon) is included in the scene (fragment toward panther at left). This great pediment, with the smooth and well-defined forms of the figures and the austere elegance of the decorative motifs in the borders of robes, the serpents heraldically entwined, and the rosettes placed at regular intervals on the panthers' hides, represents one of the loftiest expressions of Greek sculpture at the beginning of the 6th century B.C. The contrast between the ample curves and round face of the Gorgon, with its soft contours, and the sinewy, virile anatomy of the hero is also worthy of note. In particular, Perseus (or Chrysaor) — with his long, angular limbs; frank, clear-cut face; and wide-open eyes — presents a fitting Corinthian counterpart to the Attic sophistication and restraint manifested in the kouros of the Sounion temple (I, PL. 346) and in the Dipylon head (I, PL. 345).

More recent evidence of the artistic tendencies of Kerkyra may be seen in the rich Karapanos collection of terra cottas (Athens, Nat. Mus.), among which are large figures of Artemis with animals of varied aspect; this form developed between the beginning of the 6th and the middle of the 5th century. While these figures seem reminiscent of certain schemes and methods of the Corinthian tradition, they are at the same time related to motifs found in southern Italy and Sicily, particularly in Taras and Syracuse: for example, the Tarentine Artemis type with a fawn under her arm. The most important small bronze from Kerkyra is undoubtedly the so-called "boxer" (Br. Mus., no. 212), with his powerful and sinewy body, a work that Langlotz includes in his "Sikyonian" group. More timid and languid of mien, despite her great size, is the Karapanos Aphrodite wearing a peplos (Athens, Nat. Mus.). A small bronze lion (Br. Mus., no. 232), in its kinship to a lion from Perachora, confirms the Corinthian influence in even the minor plastic arts of Kerkyra; whereas the small warrior in combat, from Aphiona, is already classical and therefore impresses with a more elusive individuality.

More recent exploration in Corfu has revealed vestiges of a Doric temple near Paleopolis, architectural fragments of capitals, palmettes, and figural acroteria — the last elements apparently of the early 5th century. Great quantities of ceramic fragments, most of them from Corinthian workshops, have also come to light.

ARTISTS AND BIBLIOG. Kerkyra. *Sculptor*. Ptolichos (Πτόλιχος), lived 5th cent. B.C. (second half?), pupil of Kritios and master of Amphion of Knossos (C. Picard, II, p. 637, note 1; Lippold, GP, p. 175).

EUBOEA. The inclusion of Euboea, largest island of the Aegean, in an article on the art of northern Greece may be justified by a degree of affinity with the great northern centers of Greek civilization in certain marginal aspects of culture, even if the bonds of race and culture with the Aegean Islands and with Attica and Boeotia might have suggested its discussion in the articles devoted to these areas (see ATTIC AND BOEOTIAN ART; GREEK ART, AEGEAN). Excavations at Eretria that have revealed a quarter inhabited by ceramic artists, together with a thorough classification of the most ancient discoveries, allow much more precise opinions than were formerly possible concerning the artistic development of the island. It is therefore possible to form, at least for Eretria, a picture of a continual development, from about the 8th century onward. With all this wealth of data, there is not the slightest link with the class of vases usually called "Chalcidian." The study of Euboean or Eretrian pottery reveals an uncertain line of development that wavers noticeably among various artistic tendencies of the vicinity or those predominant in particular periods. Some dependence upon Corinthian models has been discerned, such as in the cylindrical pyxis decorated with running dogs. Nevertheless, the general stylistic direction was determined above all by repeated contacts with Cycladic production, even in the shapes adopted, among which the large amphoras with tall truncated-cone supports predominate. But in the 6th century B.C. the fashion changed, and subservience to Attic influence was complete. Three large craters or funerary amphoras in Athens (Nat. Mus.) might be described as wholly Attic except for a slight provincial flavor about the figures. The customary form also changed from the large Cycladic amphora to the lebes gamikos, a jar for lustral water, which prevailed in Attica in the first half of the 6th century B.C.

Still remaining to be discovered is the vaunted Chalcidian bronzework. The only consistent group that, on the strength of isolated finds, might perhaps be linked with Euboean art is that of the late bronze hydrias, so many of which have been found in northern Greece.

Chalcidian origin of a small statue of a seated goddess, apparently in pure Cretan style (Louvre), is uncertain. In any case, this statue remains an isolated work that cannot be traced to a Chalcidian center or even to Euboea in general. The few works of sculpture found in the island cannot be dated before the second half of the 6th century B.C. To this period should be assigned a little Poseidon in combat from Chalkis, and to about 520 B.C. an exquisite kouros head in the Archaeological Museum of Chalkis, a work clearly imbued with the softened Cycladic plasticity. On the other hand, the pediment of the Temple of Apollo in Eretria reveals an undoubted affinity with contemporaneous Attic sculpture, an affinity evident in the solid, firmly outlined figure of Theseus from the principal group, representing the rape of Antiope (I, PL. 369). The hero, with his elaborately patterned curls and unyielding square jaw, demonstrates Attic origin in the balance maintained between solid structure and delicately modulated and carved surfaces. The same clear-cut outline is seen in a standing figure of Athena (PL. 46), even though greatly mutilated, and in remarkable figures of Amazons, to which examples have lately been added the kneeling statue of the Palazzo dei Conservatori in Rome and another broken figure from Eretria.

A torso of Apollo from Eretria, dating from the initial phase of the severe style, characterized by extreme formal austerity and intense virility, already seems to have surpassed contemporaneous Attic models of the first quarter of the 5th century, almost as if anticipating the reserve and calm authority of the Phidian *Apollo* of Kassel (III, PL. 353). Later examples of sculpture, such as the interesting stele from Karystos (PL. 46), might easily be included, almost without distinction, among the contemporaneous production from Attica, absolute ruler in the general artistic koine of mature classicism. The sparse examples of later work, such as the headless statue of a seated goddess from Chalkis, seem to confirm this orientation; but minor works, such as a votive relief with Aphrodite seated on a rock and an Eros, reveal a deficient plastic sense, as well as the prevalent taste in the decorative arrangement of drapery, and therefore should be related instead to Boeotian or Locrian work; the previously mentioned relief of Larymna showing the sacrifice of a ram is a relevant illustration.

ARTISTS AND BIBLIOG. Euboea. *Architect*. Kleisthenes (Κλεισθένης) of Eretria, father of the philosopher Menedemos, active before mid-4th cent. B.C.; scenographer, hence may have worked as theater architect, perhaps on reconstruction of the theater of Eretria (Pfuhl, II, p. 700; C. Weickert, ThB, s.v.). – *Sculptors*. Megistokles (Μηγιστόκλης), archaic period, probably of Chalkis, where a signed relief representing a sculptor at work has been found (Picard, I, p. 196, note 2; G. Lippold, RE, Sup. VIII, s.v.). – Philesios (Philesias?; Φιλήσιος) of Eretria: bronze bull, offered at Olympia by the Eretrians before 490 B.C., of which some fragments and the signed base remain (G. Lippold, RE, s.v., no. 3; Lippold, GP, p. 73, note 4). – Hierarchos (Ἱέραρχος), 4th cent. B.C.: signature on a block with votive offering of a fountain, from Styra (G. Lippold, RE, Sup. III, s.v.; ThB, s.v.). – Silanion (Σιλανίων) of Athens, active ca. 370–320 B.C.: statue at Oreos, taken to Pergamon by Attalos I (for other works see ATTIC AND BOEOTIAN ART; Lippold, GP, p. 272 ff.). – *Painters*. Timagoras (Τιμαγόρας) of Chalkis, mid-5th cent. B.C.; winner in painting competition at Delphi (G. Lippold, RE, s.v., no. 6; ThB, s.v.). – Kleisthenes (Κλεισθένης) of Eretria, scenographer and architect (see above). – Ismenias (Ἰσμηνίας) of Chalkis, perhaps the father of the sculptor Parthenokles: panel (pinax) offered by Habron, son of the orator Lykourgos, after 324 B.C. in the Erechtheion (see ATTIC AND BOEOTIAN ART; Pfuhl, II, p. 779; J. Marcadé, RA, XXXI–XXXII, 1948, p. 688). – *Gem engraver*. Syries (Συρίης), probably Euboean, archaic period: scarab of steatite, signed (W. Muller, ThB, s.v.).

THESSALY AND MACEDONIA. Thessaly, of such importance in prehistoric times for its many centers of advanced culture

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

and so famous in the epic period as the scene of many ancient legends, seems to have been comparatively inactive during the periods of maximum expansion and great vitality of the Hellenic genius. And modern research has confirmed this contrast between the intense life of the most remote ages and the relative quiescence of the periods coeval with the great centuries of artistic creativity in other parts of Greece. It therefore seems obligatory to recognize a period of attenuated vitality in Thessaly, amounting almost to a gap without any precise historical justification: for instance, at Pharsalos a tumulus tomb of late archaic style is grafted, without transitional forms, onto a Mycenaean tholos.

The most notable Mycenaean remains of Thessaly have been located in fabled Iolkos (mod. Volos), where excavations have yielded remarkable remnants of pottery that shed new light on the store of ancient legends. Examples from the Geometric age are few and of little interest, with the noteworthy exception of a bronze statue of a warrior, fully armed and unusual in its dimensions (Athens, Nat. Mus., no. 12831). Nothing else has been found to compare with the disharmony and disjointed vehemence of this unusual figure. Thessaly has revealed few traces of temples or votive statues. The modest offerings of the Temple of Zeus Thaulios at Pherai (mod. Velestinon) — although this edifice must have been of great importance for the local cult — include bronzes that are of poor quality, with the exception of a magnificent archaic warrior, unanimously judged an importation from a Peloponnesian center. Moreover, the bronzes that have appeared from time to time in this region, often remarkable both for general and individual qualities, cannot be classified according to a continuous and consistent scheme of development. Thus, the vibrant and delicate *Perseus* from Halmyros, with the large kybisis hanging from his shoulder, should perhaps be attributed to a Corinthian source. The warrior of Edessa may be related to the bronze craters of Dodona and Trebenište; however, it is more difficult to ascertain the source of isolated works such as the goddess with the dove (Berlin), also found in Thessaly, and the uncommon nude maiden (Munich) from Verroia, considered one of the most notable female nudes of ancient times prior to the inspired work of Praxiteles. Such works are foreign to the general artistic climate of the region, and their presence in Thessaly seems as fortuitous as the discovery — rare in a land where ceramic importations were, indeed, infrequent — of a superb calyx-crater in the tumulus tomb of Pharsalos, which approaches the work of Exekias (q.v.). The same disjointed and random impression is created by the few finds of marble sculpture in this region, most significant of which is a head of a youth, from Halmyros, probably an example of island art (*AM*, LXV, 1940, p. 63).

The only consistent art form, making up a compact group, is the Thessalian stele, a form developed over a rather limited period, however — apparently less than a century (ca. 480–400 B.C.) — and on a very modest scale. One of the oldest, and perhaps the most refined, is a stele from Pharsalos (PL. 47) with two facing female figures (their interpretation remains debatable), which because of its decidedly Ionic style must in some way be related to the long Thessalian sojourn of the wandering artist Telephanes of Phocis. It is known, furthermore, that Telephanes worked in Persia at the court of the Great King as well. In any case, there is an extremely close similarity between the heads on the Pharsalos stele and a head found at Xanthos in Asia Minor, which is in turn related to reliefs from the Tomb of the Harpies (Br. Mus.). Consequently, although the theory of a northern Ionian school has not found the necessary support in the data available, there remains the fact of a production of reliefs, of limited range and subject matter but often most attractive in their very modesty. They generally exhibit figures austerely draped in heavy and substantial garments: the men often with the chlamys and petasos (wide hat); the women veiled, timid, and withdrawn. Plastic effects are at the same time delicate and vigorous, with decided emphasis on the soft, heavy folds, the simplified and blunted outlines, and the serene, easy attitudes. Within these limits the Athens stele of a man with a petasos, with its heavy modeling of the back of the neck and attenuated planes of relief, and that of the veiled woman of Volos (*AM*, LXV, 1940, p. 78) are artistic expressions of great originality and poetic charm.

The earliest of the Thessalian steles has something in common with a singular relief from Gomphoi, depicting the recognition of Odysseus. The legendary scene seems to have been conveyed in the manner of a votive relief, which has also lent its form to the slab; thus there seems to be a return to some aspect of hero worship, typical of Thessaly. Because so few names of Thessalian artists are known, it is exceptional that those of Herakleidas and Hippokrates, named as the creators of a votive offering at Delphi, have come down to us; the offering included statues of two great heroes of the land, Achilles on horseback and Patroklos running beside him. Thessaly, like neighboring Macedonia, was a land of feudal and heroic traditions, barely touched by the democratic spirit of the rest of Greece and perhaps less completely dependent upon temple and religion as a focus for noteworthy artistic activity. It might almost be said that the enormous importance of heroes and hero worhip, obviously essential in a country of feudal traditions, resulted in a degree of decline for the temples and the cults of the major gods. In fact, among the most famous sanctuaries of the region are that of Achilles, the Thetideion at Pharsalos, and the sanctuaries of Protesilaos at Phylakes and at Elaious in the Chersonesos. Even the worship of Asklepios — at least in its original form — was at Trikka decidedly a hero cult of oracular character. Such tendencies may be linked with the enormous importance attached to tombs, especially in the Hellenistic age, in Thessaly, Macedonia, and Thrace. Attesting this prominence are the magnificent tumulus tomb of Pharsalos and numerous monumental tombs with architectural fronts, decorative sculpture inside and out, painted vaults, and sumptuous funerary beds, really worthy of a heroön, such as may be seen in a semisubterranean building at Kalydon. These artistic forms are present in the monumental tombs of Vergina, Naousa, and Stavroupolis, which constitute valuable elements of knowledge of Hellenistic art. In this connection, isolated monuments such as the painted tomb of Kazanlik (PL. 48) in Thrace are noteworthy.

The tendency toward a more and more civilized and luxurious life, with the merely human and secular elements predominating, is evidenced by the famed achievements of Hellenistic goldsmiths, sumptuous objects found quite frequently in Thessalian and Macedonian territory. Worthy of mention are the very important finds included in the Benaki and Stathatos collections (now respectively in the Benaki Mus. and the Nat. Mus., Athens); the silver patera with an inscription to Athena from Kozani; and the Bulgarian treasures of Duvanli and Panagyurishte (PL. 49). These evidences of a feudal and luxurious life in countries whose coinage alone shows them to have been rich in metals, particularly Macedonia, are proof of the orientation of artistic endeavor more and more toward purely human and secular ends. In Macedonia, especially in the princely palaces of Pella and Palatitsa, are found the first examples of a sumptuous civic architecture quite unimaginable in any other part of Greece. Particularly striking are the mosaic pavements, apparently of the end of the 4th century B.C., which surpass in purity of design and wealth of invention those of Olynthos and Sikyon. The great mosaic of Palatitsa constitutes one of the most elaborate examples of decoration contrived from a basic pattern of scrollwork. Even finer are the mosaics of Pella, with the superb adolescent Dionysos riding on a panther and the monumental lion hunt (PL. 48; X, PL. 175), which recalls the figures on the monument portraying Alexander's hunt offered at Delphi by Krateros. The great stele from Pella (now in Istanbul; III, PL. 357) stands in a class apart, as a most important monument almost without connection to the production of Thessalian steles, which appear modest and simple in comparison. In the figure of the Macedonian warrior the breadth of design, the subtlety of the graduated planes, and the decorative effect of the chlamys indicate Ionian influence, though it is not possible to suggest a precise point of reference. The last artistic descendants of the Thessalian steles are the painted steles of Pagasai (PL. 48), works of the late Hellenistic period that, while often of very inferior quality, nonetheless have the merit of offering a fairly direct reflection of Hellenistic painting.

One of the strangest problems in the identification of crafts in 4th-century Greece is presented by a class of large bronze hydrias, with figured emblems in relief at the base of the vertical handle. The sources hitherto suggested include the Dodecanese, Euboea, or possibly Attica (the last because some of the hydrias depict the rape of Oreithyia, a subject considered to be chiefly an Attic favorite). However, important discoveries in northern Greece (for instance, the very beautiful example found at Pharsalos in the 1950s) have led to reexamination of the question, with the result of suggesting the existence of a productive center — even if not the chief source — in this very region. It is difficult to separate this production of bronze hydrias from that of the mirrors with cases, decorated in high repoussé relief, which are generally found concentrated around Corinth; indeed, in its westerly regions and continental extensions, northern Greece seems to have been dominated substantially by Corinthian artistic traditions.

ARTISTS AND BIBLIOG. Thessaly. *Sculptors.* Telephanes (Τηλεφάνης) of Phocis (or Phokaia?), first half of 5th cent. B.C., worked also for kings of Persia: statues of Larissa (example of the so-called "Penelope type"?); Apollo; Spintharos. Attributions: the *Zeus* (*Poseidon?*) of the Artemision; the Ludovisi *Hermes* (III, PL. 361); reflections of his wor in the funerary reliefs of Larisa (M. Bieber, ThB, s.v.; Lippold, GP, p. 123; E. Langlotz, Museum Helveticum, VIII, 1951, p. 157 ff.). – Pronos (Πρόνος), active in the first half of 5th cent. B.C.; recorded in Thessalian inscription as the artist of votive offering to Apollo Leschaios (Lippold, GP, p. 117, note 2). – Phradmon (Φραδμων) of Argos, probably second half of 5th cent. B.C.: 12 heifers in bronze offered by the Thessalians in Temple of Athena Itonia for victory over the Illyrians and therefore dated by some scholars after 356 B.C. (for other works see PELOPONNESIAN ART; Lippold, GP, p. 169 ff.; J. Marcadé, Recueil des signatures de sculptures grecs, I, nos. 87–88). – Herakleidas (Ἡρακλείδας) and Hippokrates (Ἱπποκρατης) of Atrax, active ca. mid-4th cent. B.C. at Delphi (see above under *Delphi*; Lippold, GP, p. 248; J. Marcadé, ibid., nos. 35,37). – Lysippos (q.v.).

Macedonia. *Architects.* Deinokrates (Δεινοκράτης; or Deinochares? Hermokrates? Timochares?), considered Macedonian or Rhodian, also identified with Cheirokrates; active under Alexander the Great: plan for foundation of Alexandria; project for transformation of Mount Athos (Chalcidian) into a colossal statue of Alexander, in one hand holding a city and in the other a gobiet from which the mountain streams might flow into the sea; funeral pyre for Hephaistion in Babylon (H. Thiersch, ThB, s.v.; P. Romanelli, EAA, s.v.). – Diokles (Διοκλῆς) of Rhegion: project of transforming Mount Athos, mainly assigned to Deinokrates (H. Thiersch, ThB, s.v., no. 1; G. A. Mansuelli, EAA, s.v., no. 2). – *Sculptors.* Leochares (Λεωχάρης), active ca. mid-4th cent. B.C.: portraits of Philip, Olympias, Amyntas, Eurydice, and Alexander, the last possibly reflected in the Rondanini statue (for other works see ATTIC AND BOEOTIAN ART; Lippold, GP, p. 268 ff.; C. Picard, IV, p. 22 ff.). – Chaireas (Χαιρέας), second half of 4th cent. B.C.: portraits of Philip and Alexander the Great (Lippold, GP, p. 288; L. Guerrini, EAA, s.v., no. 1). – Lysippos (q.v.). – *Painters.* Apelles (q.v.). – Nikomachos (Νικόμαχος), Boeotian, second half of 4th cent. B.C.: portrait of Antipatros (Antipater), king or administrator of the Macedonians, perhaps dated 323–319 B.C. (for other works see ATTIC AND BOEOTIAN ART; Rumpf, MZ, p. 146 ff.). – Zeuxis (q.v.). – *Gem engraver.* Pyrgoteles (Πυργοτέλης), because of his fame, the only gem engraver authorized to portray Alexander the Great (W. Müller, ThB, s.v.).

THRACE AND THE PROPONTIC LITTORAL. The southern region of Thrace, which for the ancients was still part of Macedonia, offers a decided contrast with the picture just presented of the artistic activity of the Thessalian and Macedonian lands. Whereas these vast regions of decidedly continental character remained open to Corinthian influences, the cities of Thrace seem to have looked toward the sea and to have been profoundly influenced by the Ionian and other islands. It is not improbable that among the chief transmitting centers of such influence were Thasos, the northern exponent of the Cycladic culture, and the metropolis of Neapolis (mod. Kavalla). The character of ancient Neapolis has begun to emerge more clearly as information on the site has grown. Excavations since World War II have revealed a magnificent temple dedicated to Athena Parthenos, architectural fragments of which have come to light, among them some fine archaic Ionic capitals and a collection of votive offerings lent extreme interest by the variety and refinement of its ceramic importations. In ceramics the dominating influences also were from the Ionian and other islands. The principal finds comprise fragments of Melian and Rhodian work as well as remains of the very unusual Cycladic plates, whose importance has been disclosed by later discoveries at Thasos. The Neapolis finds are completed by some Laconian fragments and copious Attic black-figured fragments, many from cups. (There is a notable absence of red-figured pottery.) The well-known Vulgaridis head of a kore (PL. 50), a highly refined example that rounds out the scant information about female types in the art of Thasos and coastal Thrace, cannot be effectively separated from the sculpture and minor plastic arts of Thasos, though it is from Neapolis. Most unusual is a representation in archaic style of Neapolis itself, in a 4th-century frieze carved in relief.

Thessalonica (mod. Salonika) was a relatively late Macedonian foundation; no definite remains have emerged of the ancient city of Therma, which had preceded it on the same site. A terra-cotta relief of the mid-5th century B.C., with one of the customary heroes astride a dolphin, has been tentatively accepted as an image of Thermaios, mythical founder of the city.

Several of the coastal cities of Thrace are known in modern times only through their superbly designed coinage. The gold deposits of Mount Pangaion cannot wholly explain the magnificent assortment of coins; indeed, cities that boast a solid economy and assured sources of wealth do not generally design countless variations of their coinage. High artistic standards, imagination in decorative motifs, and a peculiar descriptive idiom are among the most vivid and characteristic features of the monetary production of this whole region. The widely varied representations on the coins found in the region around Pangaion, sometimes of unknown provenance, reflect the mannered and languid expressions of the last phase of Ionian archaism in their complicated scenes depicting heroes on horseback, satyrs courting and abducting nymphs, sacred chariots, and oxen. The coinage of Ainos (PL. 52), displaying typically Hellenic concentration and limpidity in its polished forms, constitutes one of the most important sources for the study of ancient numismatics. From this coinage — in which there insistently reappears, with ever-increasing authority and purity, the face of the god Hermes or the image of the goat, an animal sacred to him — has been derived more precise knowledge of the great deity of the city; a votive image of Hermes is also known to have been mounted on a complicated throne or base, like the Apollo of Amyklai. The face of this Hermes of Ainos presents an example of harmonious and resplendent classicism such as has never been found elsewhere in Thrace.

Even more nebulous are certain cities of the area, famous in antiquity, that have become little more than names: for example, Akanthos, a colony of Andros with a treasury at Delphi, in modern times known only for a simple relief (Louvre) showing a lion attacking a bull; the design of this relief recurs on the coins of the city.

Olynthos, despite a long history and the important archaeological fact that it was totally destroyed and apparently abandoned in the mid-4th century B.C., has not substantially rewarded the great excavations undertaken there. The findings have provided a picture of a largely bourgeois city of the late classical age, with extremely limited artistic activity — a city importing an abundance of Attic vases of poor quality. It has proved vain to seek traces of the sculptors Herodotos, Herodoros, and Sthennis, who are known to have been natives of the city. However, it should be borne in mind that even late Hellenistic sculptors, such as a certain Simos who worked in Rhodes, were still called citizens of the already destroyed Olynthos. Nothing remains of the most ancient city on the site; and although it is possible to trace the outlines of the Hellenistic city, including a series of modest houses (FIG. 111), Olynthos does not seem to have had any imposing center for votive monuments set within its own architectural precinct. The examples of sculpture found here are very poor (PL. 50). Even the terra cottas of Olynthos represent an intermediate ground in which old Ionic models (such as the head type of a veiled goddess, perhaps of Rhodian origin) are modified by Boeotian traditions. Certainly the most

significant finds are a few fragments of Attic pottery, among them a cup by the Heidelberg Painter. There is also a curious local production of pottery, of a vaguely Orientalizing type, not unrelated to the so-called "Tyrrhenian" pottery of Lemnos.

Archaeological research has begun at Amphipolis, where a monumental commemorative lion similar to that of Chaironeia has been restored; a necropolis of the 4th century B.C. has also been explored. The most significant finds, however, have occurred in a locality hitherto almost unknown, Komotini; among the objects found here was the missing segment (with the whole body of a figure), of a stele believed to have come from Abdera (Athens, Nat. Mus.). This piece, which must be considered one of the finest examples of northern Ionian sculpture, is a "double-faced" relief, like the stele from Dorylaion and that of Anaxandros (PL. 51). From Komotini also has come a singular torso of a peplophoros entirely new in form, possibly related to the isolated peplophoros from the Piazza Barberini in Rome (Mus. Naz. Rom.). The cultural attainment of Komotini has been verified by the discovery at Strini, also in the vicinity of Komotini, of a remarkable red-figured Attic vase (pelike), perhaps from the group painted by Polygnotos. From another little-known locality, Bisanthe (mod. Tekirdağ or Rodosto), comes a remarkable torso of a kore (Salonika, Mus.) of very late archaic style, judging from the languid treatment of typical formal schemes.

The shores of the Propontis still redound to famous names, sites full of imaginative associations in myth and in the chronicles of great artists. Facing the tumulus of Achilles near Cape Sigeion were the tumulus and sanctuary of Protesilaos at Elaious, with its statue of the hero standing at the prow of his ship as if about to disembark on the shores of Troy. In all probability, this was the work of Deinomenes, an artist of whom little is known, but whom G. Lippold assigns to the end of the 5th century B.C. on the grounds of historical associations deduced from two statues of heroines, the Argive Io and the Arcadian Kallisto, on the Acropolis of Athens. The ancients recorded another statue (also of the Propontis) by this artist, that of Queen Besantis. A famous *Hermes* by Polykleitos was at Lysimacheia and another, more popular *Eros* by Praxiteles at Parion. However, apart from literary references, the two centers that have yielded the most significant material are Perinthos and Kyzikos.

Perinthos, a colony of Samos with a long and glorious history, was the source of a kouros torso in Budapest and an archaic head of a youth, clearly Ionic in character, in Berlin. Even more than for these works, however, Perinthos is famed in archaeological literature for two other masterworks, the Polykleitan athlete's head in Dresden and a bronze head of Berenike type (Athens, Nat. Mus.). This head type, associated with the Lichtenstein head which has been mounted on a body from Ephesos, has been met with again in a bronze Artemis subsequently discovered in the Piraeus. Kalchedon (Chalcedon), a Megarian colony, has yielded a candid and youthful kore, and a notable archaic relief in Istanbul presenting a scene similar to those of Athena issuing from the head of Zeus, attended by the Fileithyiai.

On the Asiatic shore of the Propontis lay the great and unrivaled center of Kyzikos, a Milesian colony of great splendor, famous for the high standard of its coinage. Kyzikos has yielded such remarkable examples of pure Ionic style as the two reliefs with chariots (PL. 50); another relief, with softened outlines, of Herakles shooting an arrow; and the unusual relief depicting two heraldic groups of lions on a stricken bull. The impressive figure known from a statue in the Metropolitan Museum and from the Kyzikos torso in the British Museum — provisionally identified with Protesilaos — in the opinion of L. Curtius represents Kyzikos, the hero who gave his name to the city, in a gesture of attack. A comparable figure recurred on the coins of Kyzikos at the height of the classical period. It should be pointed out that in the great variety of types used on the coins (e.g., animals, winged spirits, monsters, heroes) there are also images borrowed from other cities, such as the two Athenian tyrannicides. The names of some artists of Kyzikos have been recorded, among them the bronzeworker Stratonikos of the Hellenistic period. It is reasonable to suppose that the famous "rococo" group called "Invitation to the Dance," a theme of idyllic charm whose individual statues are scattered in a number of museums, was known at Kyzikos, as attested by the coins.

The shores of the Bosporus have yielded some unusual reliefs with involved calligraphic outlines, assigned to the end of the 5th century B.C., which seem to be the most significant echoes of the ancient Greek Byzantion (Byzantium), later submerged by the Roman Imperial city and then Byzantine Constantinople. On the shores of Asia one of the most promising archaeological localities seems to be Daskyleion, whence comes a relief perhaps of a funerary building, with a representation of veiled

Olynthos, plan of a residential block. (*A*) Plan of a typical house: (*a*) *prothyron*; (*b*) *aule*; (*c*) *prostas*; (*d*) andron; (*e*) storeroom; (*f*) *pastas*; (*g*) kitchen; (*h*) bath; (*i*) *kapnodoke*; (*j*) *diaiterion* (*from D. A. Robinson, 1930–52*).

women riding; in this relief Hellenistic elements are combined with an Asiatic motif, possibly of Achaemenid origin. Dorylaion is famous for its so-called "double-faced" stele bearing an image of the Potnia Theron (PL. 51), a subject unusual in late archaic art and simplified in design, with only a single lion represented. On the Pontos, from the Megarian colony of Mesambria (mod. Mesembria) have come large reliefs, apparently of a funerary character, also dating from the first classical age. One of these shows a household procession with domestics, as well as chariots and men on horseback, widely spaced and modeled in the late Ionic style, a mode also seen in the tomb friezes of Xanthos in Lycia. Another fragment, more obviously Asiatic in character, is important not only for its uncommon sacrificial scene but also because the representation is similar to that on one of the doors or niches typical of the altars of Thasos. The great bronze bear (Istanbul, Archaeol. Mus.) from Adrianopolis, in the interior of Thrace, must also be traced to an Ionian formal tradition because of the tonal brilliance of the long shaggy hide, so different from the formal clarity of the Corinthian and Attic traditions. The objects in bronze and precious metals from Duvanli seem to show more evidence of barbarian intrusions, but the importation of Attic vases is indicative of the artistic aspirations of the region.

Farther north on the Thracian coast was Apollonia, a Milesian colony traditionally regarded as the most illustrious center in the region. However, no trace remains of the city, known to have been the site of the famous Temple of Apollo adorned with a colossal statue of the god by Kalamis. A somewhat vapid head of Apollo from Odessos (mod. Varna) vaguely resembling the *Apollo* from the Omphalos (III, PL. 353) seems to reflect the *Apollo* of Kalamis. This renowned statue from Apollonia, taken to Rome by Lucullus, appears also to have been recorded on coins. The most significant remains from Apollonia consist of notable examples of Ionian pottery, Rhodian Bird bowls, fragments in the Camiran style, and Ionian cups, in addition to Attic fragments. A singular terra-cotta frieze (Louvre) exhibits pointed and incised forms that seem to reflect provincial developments rather than the normal Ionic idiom of the region. On the other hand, purely Ionian origin is manifested by a robed kouros that closely resembles two figures from Samos and a torso in the Archaeological Museum in İzmir. The beautiful stele of Anaxandros (PL. 51) from Apollonia is serenely harmonious in its graceful outlines and refined forms. As has been noted, this is another of the steles decorated both front and back.

Excavations of Istros, a more northerly Pontic site, have proved far more rewarding than those at Apollonia — and this despite the fact that they have been of more limited scope as far as deep excavation, below the level of the Roman city, is concerned. The few deeper trenches have yielded an unusually rich and varied trove of Ionian ceramics. The most notable finds include Rhodian Bird bowls, Milesian eye cups, the common Ionian cups, and some remarkable examples of calyx-craters and amphoras from Fikellura.

Increasing archaeological importance has come to be assigned to the city of Sinope, on the Paphlagonian coast of the Pontos. This old Milesian settlement was in a strategic location that gained it dominance both over sea transport and over the caravan routes of the interior. Its coinage displays a type of archaic Apollo, not unlike the *Apollo Philesios* of Kanachos. Excavations have brought to light fragments of Corinthian aryballoi — proving the ancient origin of the city — and notable examples of ceramics from Chios and Fikellura; Attic penetration as early as the mid-6th century B.C. is indicated by the presence of a Siana cup. However, the most surprising evidence yet uncovered is two steles in the severe style, carved in the northern Ionic manner with notable skill and vigor. Interesting data are also offered by a bronze hydria decorated with a female bust, a late archaic work that shows exceptional refinement and formal originality. Sinope is also famous for the colossal *Hades* by Bryaxis, a statue later transported to Alexandria, where it was to represent Serapis.

ARTISTS AND BIBLIOG. Thrace. *Architect*. Asklepiades (Ἀσκληπιάδης) of Lampsakos, active in Thracian Chersonesos at an uncertain date; known only from an inscription in Madytos (H. Thiersch, ThB, s.v.; G.A. Mansuelli, EAA, s.v., no. 4). – *Sculptors*. Polykleitos (q.v.). – Paionios (Παιώνιος) of Mende, active ca. middle of or second half of 5th cent. B.C. at Olympia (see PELOPONNESIAN ART; G. Lippold, RE, s.v.; Lippold, GP, p. 205). – Dorotheos (Δωρόθεος) of Olynthos, son of Hagesandros (or Hegesandros?), probably lived before 348 B.C.: signed base from Mytilene, re-used in 62 B.C. for statue of Pompey (Lippold, GP, p. 248; L. Guerrini, EAA, s.v., no. 2). – Herodotos (Ἡρόδοτος) of Olynthos, lived 4th cent. B.C.: portraits of the courtesans Phryne and Glykera (the former perhaps identifiable in a later inscription: younger artist of the same name?); the lyre player Argeia (E. Pfuhl, RE, s.v.; Lippold, GP, p. 248). – Herodoros (Ἡρόδωρος) of Olynthos, father of Sthennis, identified by some scholars with Herodotos (ThB, s.v. Herodoros; Lippold, GP, p. 248). – Sthennis (Σθέννις) of Olynthos, emigrated to Athens after the destruction of his city (348 B.C.); (see ATTIC AND BOEOTIAN ART; C. Picard, III, p. 248; Lippold, GP, p. 303). – *Painters*. Pamphilos (Πάμφιλος) of Amphipolis, pupil of Eupompos and master of Apelles, Melanthios, and Pausias; active in the first half of 4th cent. B.C.; established rules of the Sikyonian school (see PELOPONNESIAN ART); wrote on the art of painting and skilled in encaustic technique: *Battle of Phlious* (367–366 B.C.); *Odysseus on the Raft*; a family group (G. Lippold, RE, s.v., no. 30; Rumpf, MZ, p. 132). – Athenion (Ἀθηνίων) of Maroneia, pupil of Glaukion of Corinth, active in the second half of 4th cent. B.C.; works found at Athens and Eleusis (see ATTIC AND BOEOTIAN ART; Pfuhl, II, p. 775 ff.; EAA, s.v., no. 1). – Aristomachos (Ἀριστόμαχος), of the region of the Strymon, also identified with Aristomenes, a painter from Thasos (or Strymon?): scene of three courtesans (painting or relief?) bringing offerings to Aphrodite (L. Guerrini, EAA, s.v., no. 2; B. Sauer, ThB, s.v. Aristomenes, no. 2).

Propontis. *Architects*. Mandroklees (Μανδροκλέης) of Samos, perhaps also a painter: bridge of boats across the Bosporus for expedition of Darius against the Scythians in 514 B.C. (see GREEK ART, EASTERN; E. Fabricius, RE, s.v., no. 1). – Hermokreon (Ἑρμοκρέων), active in the second half of 4th cent. B.C. or during Hellenistic age: great altar at Parion, reproduced on coins (E. Fabricius, RE, s.v.; ThB, s.v.). – Asklepiades (see above, under *Thrace*). – *Sculptors*. Hagesias (Ἁγεσίας), sometimes identified with Hegesias and Hegias; dates uncertain: a *Herakles* at Parion, possibly reflected in a small surviving bronze (Lippold, GP, p. 108). – Deinomenes (Δεινομένης), perhaps an Argive, active in the last quarter of 5th cent. B.C.: statue of Protesilaos, hero of Elaious (copy found at Kyzikos); statue of Queen Besantis (see PELOPONNESIAN ART; Lippold, GP, p. 203). – Praxiteles (q.v.). – Lysippos (q.v.). – Sosigenes (Σωσιγένης), son of Eukrates; dates uncertain: inscription from Kyzikos (M. Bieber, ThB, s.v.). – *Painter*. Androkydes (Ἀμδροκύδης) of Kyzikos: battle of horsemen, commissioned by Thebes in 379 and dedicated in 371 B.C.; Scylla surrounded by fish (Rumpf, MZ, p. 124; L. Guerrini, EAA, s.v., no. 1). – *Metalworker*. Tauriskos (Ταυρίσκος) of Kyzikos, dates uncertain (M. Bieber, ThB, s.v., no. 2).

Pontos Euxeinos. *Sculptors*. Kalamis (q.v.). – Bryaxis (Βρυάξις) of Athens, active ca. mid-4th cent. B.C.: a Hades enthroned, in his sanctuary near Sinope, later brought to Alexandria, or perhaps executed for temple at Alexandria (known from copies, gems, and coins); kore in the same sanctuary at Sinope (for other works see ATTIC AND BOEOTIAN ART; Lippold, GP, p. 257 ff.; L. V. Borrelli, EAA, s.v.). – Sthennis (Σθέννις) of Olynthos (see above, under *Thrace*; Lippold, GP, p. 303). – *Painter*. Zeuxis (q.v.).

**GREEK ART, WESTERN.** The representational art of the West Greeks is known mostly through finds in the Greek colonies established after the 8th century B.C. in southern France and Spain and above all in southern Italy and Sicily. From the 8th century on, the most significant artistic developments of the Hellenic civilizations of the west occurred in the important Greek colonies of Sicily and in the lands collectively termed Magna Graecia (*Μεγαλη Ἑλλας*; Polybius, ii, 39, 1) by the Greeks themselves. The Italic population of the neighboring regions imported and copied Greek works of art in great quantity. The art of these areas, which flourished especially between the 6th and 4th centuries B.C., assumed characteristics that distinguish it from the contemporaneous art of the Greek homeland (see ARCHAIC ART; CLASSIC ART). The advance of the Italic peoples (4th cent.), the Punic Wars (3d cent.), and finally the Roman conquest prevented the autonomous political development of the colonies and limited the possibilities of their economic expansion. The art also declined, but only after it had served, in the regions subjugated and unified by the Roman republic, as the effective leaven in the Hellenization of Italy (see HELLENISTIC-ROMAN ART).

SUMMARY. General considerations (col. 116). Precolonial Aegean traditions and indigenous substrata (col. 118). Architecture (col. 120): *The development of the orders in the west: a. Doric; b. Ionic; c. Corinthian. Architectural terra cottas. Lion-head waterspouts.* Sculpture (col. 130): *Marble sculpture; Pythagoras; Limestone sculpture; Terracotta sculpture; Bronze sculpture.* Metalwork (col. 150). Ceramics (col. 153). Painting (col. 161). Mosaics (col. 162) Coins (col. 163). Art of West Greek colonies outside Italy (col. 166): *Gaul; Spain.* Greco-Punic art (col. 170). Conclusion: Diffusion of Magna Graecian and Sicilian art (col. 171).

GENERAL CONSIDERATIONS. Although the art of Magna Graecia and Sicily was once considered a provincial offshoot of the art of the Greek mother country, recognition of its independence and originality has grown. But even so, it cannot be thought of as a unified and homogeneous entity. The many forms of this art can best be understood as a series of gradations from Greek art proper, arising from complex relationships between the Hellenic artistic tradition and indigenous Italic forms.

There is no doubt that some sculptors of bronze as well as potters reached Italy with the first Greek colonists. Certainly the works these artists created in Italy were no different from the productions of contemporary Greek masters or from their own earlier work done on Greek soil. Later, as the standard of living rose, the colonies were able to attract other artists as well, many of whom remained and adapted themselves to the way of life of the western colonies. Thus, during the 7th and 6th centuries B.C. there was gradually established in Sicily and Magna Graecia a more autonomous artistic tradition: "Italiote art," as the Greeks of the mother country called it (Antiochos of Syracuse, fragments 3–7). But even this art varied from one colony to another, often in a manner difficult to define, primarily because there were no centers influential enough to unify the numerous colonies culturally and artistically. Moreover, there were differences of degree in the integration of local populations with colonists in various areas, which, among other factors, also contributed to cultural differences. The various cultural components and strata are well documented by the burial finds of Lokroi hoi Epizephyrioi (mod. Locri), Megara Hyblaia, and Leontinoi (mod. Lentini). In Sicily, Carthaginian influence, felt as far as Akragas (mod. Agrigento) and Selinous (mod. Selinunte), also played a part; cultural relations with North Africa were particularly strong in the Hellenistic period, especially with Cyrene, where they had an early start, and with the Nile Delta.

The commercial necessity of creating objects to meet the tastes and needs of the neighboring Italic populations must have played a determining role in art production. The composite nature of the artistic forms thus produced was particularly evident in the Sicilian towns around Syracuse (Syrakousai), Grammichele, San Mauro, and Monte Casale, and in the Messapian colonies of the Tarentine. While these mixtures were primarily found in minor provincial centers such as Krimissa (mod. Cirò), they also penetrated to a surprising degree into more cosmopolitan centers such as Lokroi, Leontinoi, Taras (mod. Taranto), and even Syracuse, attesting the vigorous survival of non-Hellenic elements. Enough has been said to indicate why it is difficult to find a single definition capable of embracing the many-sided art of Magna Graecia and Sicily. Such works as the Demeter Kourotrophos from Megara Hyblaia (PL. 64) and certain of the "Treasury" metopes from the Heraion at the mouth of the Sele (PL. 60; I, PL. 343) have so

Diffusion of Greek culture in the western Mediterranean basin.

great a Siculan and Italic component that it may well be asked if they still can be called Hellenic art.

Even in the major cities of Syracuse and Taras, which preserved the strongest ties with the motherland — Syracuse with Corinth, Taras first with Sparta and, from the 5th century on, with northern Greece and the territory on the Black Sea, by way of Kerkyra (Corfu) and the Egnatian Way — consideration of an autonomous Syracusan and Tarentine art is meaningful only until the early 3d century B.C. Of course, ties with Greece were not uniformly strong, whether because of war or for some other reason. There were periods of strong Greek nationalism in the west, especially in Sicily: for example, in the early 5th century, when the Carthaginians were defeated in Sicily. In these periods artistic bonds with Greece were strongest. The influence of the Greek homeland is clearly evident in the colonial architecture of about 500 B.C., the period when the finest works of Attic pottery were being interred in burials in Magna Graecia and Sicily.

Generally, the West Greek world was characterized by greater mobility of types and forms than Greece proper. Terra cottas were in great demand for ritual purposes, and the mass-produced objects as well as original models and casts were transported from place to place. Because local modifications were slight, it is difficult to isolate important art centers and to locate variations of form and decoration. Often various centers are best distinguished by some technical specialty or favored forms rather than by particular motifs and artistic devices — Lokroi by its openwork mirror handles, Kanysion (mod. Canosa) by its white jugs and askoi, and Kentoripa (mod. Centuripe) by stamnoi and bowls.

PRECOLONIAL AEGEAN TRADITIONS AND INDIGENOUS SUBSTRATA. Recent discoveries have established pre-8th-century antecedents for the art of Sicily and Magna Graecia. It has been proved that commercial relations existed between Greece and these regions as early as the 2d millennium B.C., and it even seems likely that migratory currents moved from the Aegean area westward. Systematic excavations of prehistoric strata in Sicily and Lipari by Paolo Orsi and L. Bernabò Brea and in Ischia by Giorgio Buchner have uncovered pottery of a Late Minoan type (perhaps in part locally produced) dating as early as the middle of the 2d millennium.

Mycenaean pottery types and ornamental motifs, which had degenerated and become stagnant in the west by about 1000 B.C., survived in some areas into the 8th and 7th centuries. In Cerveteri (anc. Caere), a Late Minoan crater was found in a burial together with Corinthian vases (Rome, Villa Giulia); some pithoi found in Butera and Gela (Syracuse, Mus. Arch. Naz., nos. 50187,

21205) have the forms and the lily decoration of Late Minoan pottery; and the Siculan "prehistoric" pottery shows obvious derivation from Mycenaean ornamental forms. The prehistoric architecture of Sicily also shows the stimulus of Mycenaean architecture, though no direct contact is evident. The royal Mycenaean burials undoubtedly furnished the model for the domed tombs of Sant'Angelo Muxaro (near Agrigento), in which, moreover, were found gold seals and bowls inspired in form and decoration by Mycenaean art. The date of these gold objects is controversial: the accompanying material is of the 7th century B.C., but the goldwork may be inherited objects made in the 2d millennium. Even in Agrigento, founded by the Greeks in 585 B.C., Mycenaean pottery fragments have been unearthed, in the grottoes of a sanctuary of the chthonian gods. Whether it dates from the 2d or from the beginning of the 1st millennium, this sanctuary (which was covered by false vaulting similar to that of the Tullianum in Rome) existed before the Greeks founded the city, and the cult seems to have been continued by the Greek colonists.

The archaeological evidence of these ancient bonds with Aegean art of the 2d millennium is given what approaches historical corroboration by the myth of Daidalos, the Minoan artist. Fleeing the Cretan king Minos, Daidalos took refuge in Sicily, where he made a golden honeycomb for the sanctuary of Aphrodite on Mount Eryx and built the impregnable fortress of Kamikos near the south coast of the island for King Kokalos. According to the legend, Minos sought to take Daidalos back to Crete forcibly; however, in Kamikos, after he and his army had been given a friendly reception by Kokalos, Minos was killed in his bath and his fleet was burned by the Sicani. A funeral monument with a temple to Aphrodite was built for the assassinated king in Akragas, and this presumably Late Minoan structure survived until about 500 B.C., when it was destroyed by Theron, the tyrant of Akragas. The Cretans, without ships, had to remain in Sicily and finally settled in Makara. It is tempting to identify this settlement, whose Greek name was Minoa, with Herakleia Minoa, west of Akragas, refounded by the Greeks in the 6th century B.C. In any case, the legend bears witness to the strong Cretan influence in Sicily.

In the same way, the Mycenaean finds in Ischia (necropolis of Pithekoussai) and Lipari have been connected with the legendary wanderings of Odysseus on the Tyrrhenian Sea and his encounters with Aeolus, Circe, Scylla, and Charybdis. The fabulous voyage of the Trojans — the places Aeneas visited during his voyage to Latium and the cities he founded, such as Segesta — also casts light on pre-Greek relationships between the Aegean world and the west.

On the Italian peninsula the Mycenaean stratum of the 2d millennium is not so distinct as in Sicily; but Mycenaean pottery fragments found in the area of Taranto (Pulsano, Avetrana, Leporano, Scoglio del Tonno) suggest that here, too, a cultural and artistic bond with the basin of the Aegean existed at that time. It would not, therefore, be surprising to find that Minoan forms continued to be used in this area as well, into the 8th and 7th centuries B.C. Not all Mycenaean vases found in Italy and Sicily date from the 2d millennium — the debased examples might have been made in the 8th and 7th centuries.

In summary, southern Italy and Sicily had artistic contacts with the Aegean world long before their colonization in the 8th and 7th centuries B.C. The bases established by the Mycenaeans may even have facilitated the later Greek colonization (see MEDITERRANEAN PROTOHISTORY).

More important than Mycenaean influence in the formation of the art of Sicily was the survival of one of the oldest indigenous cultural elements, the megalithic, which had emanated from the Balearic Islands, Malta, and Sardinia and thereafter reached Sicily. The tendency to exaggerate dimensions that can be discerned in Temples E and G of Selinous, in the Olympieion of Akragas, and in the altar of Hieron in Syracuse, is probably of megalithic derivation. To this current can be added the influence, difficult to isolate, that the Sicani, Siculi, and Elymi exercised in areas in which Greek art was not strong or was already in decline. More than in Greece itself, the variety of cultural strains had a determinant effect on the art of Sicily and southern Italy, particularly in minor colonies too weak to preserve the cultural and artistic peculiarities of their mother city. This art has a character of its own, which should not be dismissed simply as conservatism occasionally tending toward archaism or as provincial tastelessness. While, at least in some areas, the colonial art did not achieve the formal perfection of the art of the motherland, it is precisely in its deviation from the common Greek forms that it shows independence. Because of this Italic infusion it exerted a stronger influence on the art of central Italy, Etruria, and particularly Rome than did the Greek art of the mother country. (For the phase of Greek colonization and the diffusion of Greek influences in Italy, see ETRUSCO-ITALIC ART; GREEK ART.)

ARCHITECTURE. The essential features of the art of Magna Graecia and Sicily are particularly clear in the architecture, although here too Greek and Siculo-Italic elements were fused in varying degrees. In some monuments there is evidence of the survival of prehistoric forms, as in the so-called "Temple of Diana" in Kephaloidion (mod. Cefalù) and in the great well near Ugento (Salentine Peninsula), and in others Punic influence appears, as in the cornice profile of the Temple of Demeter Malophoros near Selinunte.

Nothing remains of the temples of the 7th century, which were constructed, like Greek temples of the time, of wood and clay. The highly developed execution of surviving terra-cotta sima and cornice revetments suggests, however, that wood was used extensively in western temples over a long period of time. In Etruria and Rome this wooden architecture was preserved in the time of Cato. Local limestones of various qualities became the standard material for temple construction in the 6th century. In Taras and Syracuse the stone used was hard and durable; in Akragas, very soft and easily corroded. White marble was scarce in southern Italy and Sicily and apparently was cut only in small blocks; its transportation must have been very expensive. The only surviving works that are unquestionably of local marble are a number of lion heads from temples in Syracuse and Akragas.

*The development of the orders in the west: a. Doric.* In the large cities (Syracuse; Akragas; Metapontion, mod. Metaponto) the Doric order was used as in the motherland, while in the less Greek localities (Selinous, Krimissa, the Heraion at the mouth of the Sele) deviations were common.

The earliest marble temple that can be described with any exactness is the Temple of Apollo (or Artemis) in Syracuse (FIG. 121), dated to the second quarter of the 6th century on the basis of the proportions of its peripteral colonnade (6 by 17 columns), the structure and proportions of its columns, and especially by its capitals, which closely resemble those of the mid-6th-century Temple of Apollo in Corinth (I, PL. 332). The essential features of this temple are Greek: for example, the megaron-like form of the cella and the common level of peristyle, pronaos, cella, and *adyton*; some details are more specifically Corinthian: the single rather than double peripteral colonnade (*pteron*), the rigorous placement of the cella within the pteron, and the monolithic columns on the entrance side. The pycnostyle colonnade — closely spaced, massive shafts — is an archaic feature. Besides the laxness demonstrated in the unequal intercolumniations, Sicilian characteristics of the temple are the adyton, the six-stepped *krepidoma* with small staircase in front, and the relatively recessed position of the cella.

The temples of Selinunte (PL. 53, FIG. 121), typical of West Greek architecture, diverge even more from the Doric canon of the motherland. The oldest extant, Temple C, could hardly be earlier than the middle of the 6th century, that is, about seventy years after the founding of the city in 625 B.C. The temple rests on a four-stepped krepidoma and has a wide staircase of eight steps in front. The long and narrow cella, placed, as often in the west, toward the far end of the pteron, has an anteroom, *oikos*, and adyton and lacks pronaos and *opisthodomos*. The effect of an inner porch was obtained, however, by duplicating the front row of columns along the axis of the third columns of the side ranks. The adyton was required

Syracuse, Temple of Apollo: (*a*) Plan; (*b*) reconstruction of the front elevation (*from MALinc, XLI, 1951, col. 827 ff.*).

by the cult in most Sicilian temples of the period; in Greece proper it was rare, appearing only as a feature of the worship of pre-Greek chthonic deities, but at Cyrene there is an adyton in the Temple of Apollo. The placing of the altar in the middle of the cella also differs from the Greek norm and suggests that at least this part of the cella was open to the sky. The columns of the east side are monolithic, either for technical reasons or simply out of faithfulness to the Corinthian tradition. The proportions of the building, its dimensions, and the form of the capitals reveal arbitrary variations which were unknown in the mother country. For example, the column drums of the north, south, and west colonnades vary in height; the columns on the sides have no entasis and are more slender than the columns on the end; the intercolumniations range from 12 ft., 8 in. to 14 ft., $5^5/_8$ in. This irregularity is certainly not due to negligence on the part of the architect — it is rather the expression of an architectural ideal seeking greater freedom than the strict canon of the Greek orders allows. Archaic tendencies underline this attitude; for example, the base of the triangular pediment does not extend to the edges of the cornice, and the whole pediment is reduced in size. Archaic Greek forms of the late 7th century are brought to mind by the low, wide-spreading echinos of the Doric capitals, but even the earliest Akragas capitals, of more archaic form than these, could not be that early.

Temple D also has an adyton and a wide area between the cella and pteron, but it differs from Temple C in the megaron-like form of the cella and in the termination of the antae in engaged columns, a characteristically West Greek feature which appeared in Greece only later. The architectural conception embodied is more advanced than that of Temple C — the krepidoma has five steps, and the stairway leading to the pronaos as well as the four columns of the pronaos are visible from the front, between the columns of the façade. This arrangement undoubtedly demonstrates a desire to accentuate the sense of space in the structure.

Temple F, whose metopes indicate a date in the early 5th century, has yet a different plan. The peripteral columns of all sides but the front are joined by a stone curtain wall rising to about half their height. This uncommon feature may have been designed to protect the temple, situated as it was outside the city walls, but it may also have been intended to create an enclosed area almost as wide as the cella between the cella and the pteron. The plan of the colossal Temple G shows even greater independence. The freestanding staircase in front is only as wide as the cella, whose columns have a prostyle arrangement that makes the building appear dipteral from the outside. The cella, moreover, is so wide that it may have been hypaethral. The form of the capitals suggests that the building was begun about the middle of the 6th century and finished — if it ever was finished — in the 5th century.

The Persian Wars and the threat posed by Phoenician power led the tyrants of Akragas, Gela, and Syracuse to strengthen ties with the mother country. Between about 500 and 460 — years in which Pindar and Aeschylus sojourned in Sicily — the colonists dedicated more votive gifts in Greek cities and imported a greater amount of Attic pottery than in any

other period. Greek artists and architects probably moved west at this time, and true Doric structures rose, such as the Temple of Athena in Syracuse (FIG. 121), of Poseidon in Poseidonia (mod. Paestum; PL. 53), and of Concord in Akragas, each almost pure Greek. The new influences from the Greek motherland encouraged close adherence to the canons of the orders, and some of the more divergent schemes, so apparent in the architecture of Selinous, were given up. Temple E at Selinunte reflects this change (FIG. 123). The plan of Temple E is characteristic of 6th-century Sicilian architecture — it has a freestanding staircase in front and steps leading to the cella and adyton. But the pronaos and opisthodomos typical of Greece were restored, so that the cella is *in antis* at both ends; the metopes over the pronaos and the opisthodomos are placed like those of the Temple of Zeus in Olympia; and the cella and pteron comprise an architectural unit, according to the Doric canon. In Temple A the same arrangement was followed, and the Doric canon was further applied in the narrowed proportions of the pteron. On the other hand, a West Greek peculiarity was retained in the two circular staircases leading from the entrance door of the cella to the attic. The Doric canon likewise prevails in the temples of Himera (470) and of Athena in Syracuse (460), and especially in the Temple of Poseidon in Paestum.

As early as the late 6th century, temples in Akragas were more closely bound to the Greek canon than those of Selinous, although they too demonstrated a local building tradition. At first they had no adyton but probably still had the two stairs next to the entrance door, a typically western element. In contrast to the 6th-century Temple of Herakles (shortly before 500), with its elongated ground plan, the Temple of Hera Lacinia (ca. 460) attests the shift toward the classic Doric taste. The Temple of Concord, on the other hand, departs from the strict, typically Greek relation between the cella and the surrounding columns exemplified in the contemporary Hephaisteion of Athens (430). The remains of the Olympieion of Akragas, a building hybrid in its dimensions and in other respects, are very scanty and provide insufficient evidence for an accurate reconstruction. All that can be said with certainty is that the intercolumniations were closed by walls reaching to the entablature. The cella was apparently oikos-shaped, but it extended to the west wall of the temple and therefore lacked an opisthodomos. Thus the building had three aisles, the two outer ones roofed and the central aisle probably hypaethral. The atlantes (telamones; PL. 57) were placed either between the exterior half columns or inside the cella. An innovation in the Olympieion of great significance for later central Italian architecture, particularly of the Imperial age, is the incorporation of the columns into the walls to simulate engaged columns.

Of the unfinished temple of Segesta (PL. 54), probably begun shortly before that city's catastrophic end, only the pteron, its entablature, and the two pediments remain. Its reconstruction is problematic. Since not even a trace of a cella foundation has been found, the hypothesis that the building was not conceived as a temple according to the Greek norm is not wholly improbable. The building may have been an experimental form, resembling a traditional temple on the outside but containing only a tiny cella, as in the temples of Apollo in Pompeii and in Didyma (Turkey).

In general, the Doric temples of Sicily and Magna Graecia were outwardly similar to those of Greece proper, but the internal areas were distinctively organized, since the pteron and cella had to be coordinated with an adyton for cult purposes. The impressiveness of the exterior was heightened by a series of stairs or a freestanding staircase, by a relatively deep vestibule, and sometimes by views through the pteron of the columns in front of the cella. In contrast to the rigorousness of the Doric constructions of the Greek motherland, there was a freer handling of the relationship between the cella and surrounding pteron. The development of the space around the cella reflects an interest in space that is characteristic of other forms of Magna Graecian and Sicilian art. In this connection the greater technical difficulties encountered in spanning widths up to 16 ft. must be emphasized. A constant feature of Italic architecture is the shifted position of the temple cella, which in many cases was placed not in the center of the pteron but toward the farther end, anticipating the temple architecture of Rome and central Italy from the 3d century B.C. to the late Imperial age. It is significant, however, that this characteristic arrangement of the interior space is found only at temple sites such as Selinous and Poseidonia, which were far from the Greek centers, whereas in cities where the influence of the mother country was more alive, in Syracuse, Metapontion (PL. 54), and Taras, the Greek canon was more closely observed. Moreover, it is significant that the cella was set in the rear of the pteron only in temples of the 6th century B.C. In the period after 500, the era of the great tyrants and of the victory over the Carthaginians, the Doric canon of Greece proper was adopted with

a

b

Paestum (Poseidonia). Temple of Athena (Ceres?), reconstruction: (*a*) Plan; (*b*) front elevation (*from F. Krauss, Die Tempel von Paestum: I. Athenatempel. Berlin, 1959*).

but few variations. In the areas less permeated with Greek culture, such as Segesta, Pompeii, and the mouth of the Sele, the loosening of the structural relationship between cella and pteron is even more evident. All the buildings mentioned above are of the 6th and 5th centuries. In the 4th century, even in Greece proper, few religious structures were built, and temples in the Doric order, which was no longer regarded as modern, were especially rare. Some impression of the Doric structures of the 4th and 3d centuries can, however, be formed from architectural fragments from Predio Spagna (Syracuse, Mus. Arch. Naz.).

Probably because they viewed the Doric canon less rigidly, West Greek architects anticipated those of Greece proper in incorporating Ionic with Doric forms. By the late 6th century, in the Temple of Athena (Ceres?) in Poseidonia (FIG. 126), for example, the severity of the Doric order is mitigated by the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

insertion of light, graceful Ionic columns in the vestibule. The absence of a horizontal cornice further emphasized the verticality of these slender columns, thus destroying the balance of horizontal and vertical, which is an essential feature of the Doric temple. Ionic ornamental motifs were also introduced into Doric architecture, perhaps to cover parts considered artistically weak or to enrich the severe Doric forms. The finest extant example of this combination is a group of fragments from a 4th-century temple at Predio Spagna, among which are metopes decorated with elegant crossed palmettes as well as triglyphs bordered at top and bottom by Ionic *kymatia* (cymatia).

The love of ornament may also be considered a characteristic of the architecture of Magna Graecia and Sicily. A metope of the 6th century (Syracuse, Mus. Arch. Naz. no. 12247) already has the rosette, a motif that later became very popular, particularly in the works of Italic Hellenism and Imperial Rome (e.g., the sarcophagus of the Scipios and Sullan architecture). At times the triglyphs are also decorated with vines (Syracuse, Mus. Arch. Naz.). In the areas in which the Italic element outweighed the Greek, as in Krimissa (P. Orsi, *Templum Apollonis Alaei*, Rome, 1933, pl. 8), the mixture of Doric and Ionic forms led to an unsatisfactory compromise. Examples of this mixture of styles are also found in Sicily, as in Temple B of Selinunte and the so-called "Oratory of Phalaris" in Agrigento, and in the buildings represented on the reliefs of Locri.

The form and artistic function of the Doric capital is also illuminating in defining the Doric architectural style of the west. The oldest Doric capital in Sicily, found in Agrigento, has a low and wide-spreading echinos modeled on the capital type of the Temple of Athena Pronaia in Delphi (7th cent.). This form prevailed in the west with few variations throughout the 6th century and did not give way until about 500 to the higher, tighter type which had developed in Greece proper. The new form then remained in use until the 4th century, although in Greece variations such as a flattened echinos appeared as early as the middle of the 5th century. Evidently, in West Greek architecture, unlike that of Greece proper, the capital did not function as an integral member of an organic architectural system, changing in response to changes elsewhere in the order, but was simply a static intermediary member between column shaft and entablature. The weaker sensitivity of the West Greeks to organic unity is further illustrated by their retention of the concave molding at the base of the echinos throughout the 6th century. The richest treatment of this motif is in the "Basilica" of Paestum (I, PL. 333), where two of the columns even have palmettes carved into the concave molding. This early archaic feature was discarded in the more advanced buildings of Greece proper in the late 7th century, and thereafter was used only in the provinces, as in Arcadia.

*b. Ionic.* The Ionic order, which was not so widespread in the west as might have been expected, is best known in West Greek colonies through two temples of Lokroi. The older had the traditional arrangement of oikos with adyton and two aisles, like the 7th-century Greek temples; the antae and a pteron were added later. The second temple, larger and better known, is *in antis*, with pronaos and opisthodomos, no adyton, and the cella placed almost in the center of the pteron. Although the capitals have convex fluting, in the 6th-century manner, the temple unquestionably belongs to the height of the 5th century, as is shown by the strong articulation of the lotus bands on the necking of the column. This decoration, also present in the Erechtheion in Athens (ca. 420), was apparently widespread in southern Italy, as on the 4th- or 3d-century columns of Manduria and in the Cathedral of Otranto.

Typical of the Hellenic west are the capitals on the terra-cotta sarcophagi of Gela, which bear high crowns of leaves between the volutes, comparable to that on the Column of the Naxians (PL. 13), although the Gela sarcophagi are later by almost half a century. Other examples are the Ionic capital of the Temple of Athena in Paestum and a splendid fragment with Lesbian kymation and egg-and-dart frieze, from a marble temple in Catania (anc. Katana) preserved in the Museo di Castello Ursino, coming, to judge by the form, from a building of the mid-5th century. The terra-cotta facing from a temple in Adrano is later, the ornamentation recalling that of a late-6th-century Ionian treasury in Delphi. Engaged Ionic columns must have been much used, but the only examples known are in the Oratory of Phalaris, the Tomb of Theron in Agrigento, and the Plinian spring in Manduria. This type of wall articulation spread during the Hellenistic period, especially in central Italy. Two Ionic capitals with antae in the courtyard of the Museo Nazionale in Naples may belong to the archaic style of late Hellenism.

In the 3d century the Ionic order took the lead in Italy as in Greece. Only the capitals of sacred buildings have been preserved, principally from Syracuse, Kamarina, Akrai, and Soloeis (mod. Solunto; PL. 57). These are generally characterized by a slanted position of the volutes, shrinkage of the shallow channel connecting the volutes (*canalis*), and by the elaborate curling of the palmettes next to the volutes, which by covering the canalis vitiate the sense of elasticity the palmettes were meant to give. Apparently the form of the Ionic capital, like its 6th-century Doric predecessor, was so conventionalized that it too became merely a standard connecting element between column shaft and entablature. When the decisive influence of the artistic forms of Magna Graecia and Sicily on central and northern Italy is considered, it becomes historically important that just this type of Ionic capital should more than the others have influenced Campanian, Latian, and Etruscan architecture, beginning with the 3d century. Not till the classicism of the Augustan age was it replaced by the purer 5th-century Ionic form.

*c. Corinthian.* The Corinthian order was used in Magna Graecia and Sicily from the early 3d century, but no traces have survived. The "Corinthian-Doric" Temple of Paestum, although it contains decidedly Hellenistic forms and ornamentation, must be attributed to Etruscan art rather than to that of Magna Graecia. Of extreme importance for the study of western Corinthian is the capital represented on a golden scepter found in Taranto (Br. Mus.; F. H. Marshall, *Catalogue of the Jewellery . . .*, London, 1911, no. 2070, fig. 65). It must date from the period before the Punic Wars, that is, the 4th or early 3d century. The popularity of the Corinthian order in Taras is demonstrated by the many capitals and the limestone friezes surviving from sepulchral structures (L. Bernabò Brea, *RIASA*, N.S., I, 1952, p. 224 ff.). In burials of Rhegion (mod. Reggio Calabria; *NSc*, 1942, XX, vol. 3, 2, p. 225; S. Ferri, *Divinità ignote*, Florence, 1929; Reggio, Mus. Naz., nos. 1566, 9951) many small late-Hellenistic terra-cotta capitals have been found. Their use is not completely clear, but perhaps they were placed on the graves to serve as funnels into which libations were poured. In the late Hellenistic age a special form of Corinthian capital, distinguished by curled acanthus leaves worked in high relief, developed in Syracusan monumental architecture. Similar forms have been found in Alexandria, and although it is impossible to determine whether they originated there or in Syracuse, they nonetheless document the close artistic bonds uniting the Greek west with Alexandria. The Syracusan capitals, used also in Taras, strongly influenced the architecture of Campania and Rome in the 2d and 1st centuries B.C. An unusual form of Corinthian capital, decorated with heads, busts, or figures, is found in a house at Ptolemaïs (North Africa) probably dating from Imperial times; although perhaps of Alexandrian origin, it is representative of the decorative taste and ostentation of Magna Graecian and Sicilian art.

*Architectural terra cottas.* The most distinctive element of the western temples, especially the Sicilian, was the rich, almost excessive decoration of the roof with terra-cotta revetments and figures. The colonies did not limit themselves to the current Greek systems of tile roofing but in most cases combined the Laconian with the Corinthian system (Pace, II, 1938, p. 264 ff.). The oldest simae have gutter moldings with gaily painted kymatia. Sumptuous polychrome facings were used in later buildings, mainly in Gela and the Treasury of Gela in Olympia, the old temple of Athena in Syracuse, and Temple C in Se-

linous, where terra-cotta boxes, solidly nailed to wooden simae, were topped by upright plaques that served to direct the water toward the drainage canals (PL. 56). Beginning at the end of the 6th century, lion-head spouts developed from this system of simae with drainage canals; the spouts were of terra cotta in modest temples, of limestone (PL. 57) or marble in the more important. In a third, rarer type of sima, the water flowed from palmettes and lotus flowers made in an openwork technique. These simae supported a row of antefixes, upright ornaments that were decorated with heads and often elaborated imaginatively, as at Taras (PL. 56). The chronological relationship of these antefixes to the oldest ones of Thermon (PL. 42) has not yet been clarified, but evidently it can be established that the type emigrated from Taras to Etruria, where a flourishing terra-cotta sculpture then arose (see ETRUSCO-ITALIC ART).

Another characteristic feature of the temples of Magna Graecia and Sicily is the decoration of the ridgepole. The *kalypteres*, which covered the ridgepole, were at times gigantic and bore great palmettes or, as at Megara Hyblaia, almost life-size figures of horsemen. It is not known whether these horsemen, sometimes found on the oblique pediment simae as well, were only an imaginative form of decoration or whether they had some iconographic significance relating to the temple worship, perhaps representing the Dioskouroi. Such ridgepole decoration, foreign to Greek taste, may have been invented in Sicily, perhaps by Gorgasos and Damophilos, the famous clay sculptors of the late 6th century. The tradition that they also worked in central Italy is supported by similar terra-cotta figures found at Veii (I, PL. 359) and elsewhere. Numismatic evidence indicates that such sculptural decoration of the roof was still fashionable in the Imperial age.

Human busts may have appeared on other parts of the entablature in Magna Graecian and Sicilian architecture, but figural friezes, the most important examples of which are from Velletri and the Esquiline, were not employed. Like many Etruscan motifs, the human bust may derive from Anatolian architecture. The frieze from Labocetta (Reggio Calabria; PL. 62) and the splendid fragments with a depiction of Herakles and the Hydra in Taormina were probably votive gifts rather than structural elements of the architecture.

Gorgoneia, at times very large, are also part of the elaborate decorations of Sicilian temples. The best-known examples are from Syracuse (PL. 61), Gela, and Selinunte. Fragments of pedimental terra-cotta figures have been found in Gela; they seem, however, to be rare in Sicily and southern Italy.

*Lion-head waterspouts.* From the late 6th century on, lion protomas apparently of East Greek origin were used as waterspouts for gutters and fountains in Sicily. It is not known whether they had a religious or mythological meaning, perhaps Near Eastern, in addition to their decorative and practical function. It seems logical that those worked in Greek marble, such as a protoma from Selinunte (*MALinc*, XXV, 1933–35, pls. XXXI, 1; L, 1, 2), were imported as finished products. In any case an East Greek provenance or prototype seems certain. Two types of lion protomas are found in Sicily: the first, massive and almost cubical, widened and flattened, with muzzle and throat projecting but slightly, is a variety particularly common in Anatolia and may be related to the lions of Hittite art; the second is slenderer and has a more wolflike muzzle, an almost oval head, and prominent nose and throat. It might be assumed that the types originated in two different art centers, with their own marble quarries, where protomas were mass-produced and exported to western Mediterranean lands. Analysis of the marble might supply an answer. The models themselves may have been exported — one small but very fine example, whose significance has not yet been determined, was found in the favissa of the Temple of the Dioskouroi in Agrigento. This cubic, more leonine type is also found on the northern side of the temple at Himera and in Paestum (*AAnz*, LXXI, 1956, col. 422, fig. 140), while the earliest appearances of the slender wolf's-head variety are on the Temple of Athena in Syracuse (ca. 470 B.C.), the south side of the temple at Himera, and on a waterspout in the Palazzo dei Conservatori in Rome (no. 1575).

It is only natural that in the hands of the stonecutters the two types became mixed, leading to variant forms such as those of the spouts of the temple at Himera, which clearly express the unique character of the art of Magna Graecia and Sicily. If their prototype could be identified and its successive modifications by different artists traced, it would surely be found that the development leads toward increasing ornamentality and greater accentuation of the grimace of the lion. This is particularly well illustrated by the spout heads on the south side of the temple at Himera (PL. 57), whose ferociousness is increased by ornamental devices such as furrows on the muzzle and the broad, almost square nose; the inner corners of the eyes are formed by right angles. The heads are also differentiated by the degree of agitation of the mane and by the sometimes linear and planar, sometimes curved and three-dimensional treatment of the forms. Closely related to the Himera heads are those of the Temple of Demeter in Agrigento (*Die Antike*, VI, 1930, p. 187, fig. 2).

The protomas of the Temple of Athena in Syracuse, worked in south Italian marble, follow the wolf's-head type and look more archaic than those of Himera, even though they are probably contemporaneous. By comparison, the protomas attributed to the Temple of Herakles in Agrigento are more mature in style, fuller and more sculptural, but they may have been placed on the building during a later restoration. The late-5th-century lion head found by itself in Agrigento (Palermo, Mus. Naz. Arch.) was greatly altered by restoration (*Die Antike*, VI, 1930, p. 186, fig. 1). It is of a somewhat provincial and simplified type, which reappears in Paestum in the "Basilica" and in the Temple of Athena (Krauss, 1938, figs. 19, 37). The menacing grimace and pathetic expression of 4th-century heads are especially well illustrated by the excellent terra-cotta head found in Gela (*Die Antike*, VI, 1930, p. 199, fig. 9), belonging to the period of Timoleon (late 4th cent.).

The inferiority of terra-cotta lion heads to marble ones is evident in the clay examples from Kaulonia and Kroton. These lion-head waterspouts were especially popular in Hellenistic art, and those with unpierced throats must have served solely a decorative function (Syracuse, Tempietto of Herakles). The final phase can best be followed in the numerous limestone lion heads in Syracuse. The most important and one of the largest, from the Kyane spring, is probably of the early 3d century. The skillful accentuation of the pathos and ferocity of the animal, qualities often exaggerated to an unpleasant degree in other Syracusan examples, lends this work an almost baroque quality. In many other lion heads, the plastic form approaches an abstraction wholly free of resemblance to nature. Another head from the Kyane spring (Syracuse, Mus. Arch. Naz., no. 6341; *Die Antike*, VI, 1930, pl. 23) demonstrates the persistent preference for abstract form in Italiote art, which is fully revealed when the purely Italic tendencies emerge and dominate.

ARTISTS AND BIBLIOG. (*Architects*). Daidalos (see GREEK ART, AEGEAN). – Hippodamos (q.v.). – Demokopos (Δημόκοπος), or Damokopos, of Syracuse, active 5th cent. B.C.: according to Eustathius (Commentarii ad Homeri Odysseam, III, 68, p. 1467), constructed the theater of Syracuse (G. E. Rizzo, Il teatro greco di Siracusa, Milan, 1923; H. Thiersch, ThB, s.v.; P. Romanelli, EAA, s.v. Damokopos). – Phaiax (Φαίαξ), active in Akragas, first half of 5th cent. B.C.: great system of subterranean hydraulic canals (E. Fabricius, RE, s.v., no. 5; W. Deecke, Z. der Deutschen Geologischen Gesellschaft, LXXXV, 1933, p. 83 ff.). – Epikrates (Ἐπικράτης), son of Hageas, known from an inscription near the Olympieion of Syracuse, according to which he constructed a palaestra dedicated to the city (G. A. Mansuelli, EAA, s.v., n. 3). – Diokles (Διοκλῆς) of Rhegion, age of Alexander the Great, thought to be author of a project for transforming Mount Athos into a statue of Alexander (G. A. Mansuelli, EAA, s.v., no. 2).

SCULPTURE. Except for Pythagoras — and he probably went to Rhegion when he was already a mature artist (see below, *Pythagoras*) — we are unable to reconstruct the artistic personality of any of the sculptors of Magna Graecia and Sicily, despite numerous references to them in the written tradition. The very number of artists' names known from tradition bears witness to the importance of the West Greek sculpture, though

for the most part it is not even known in what material the works were carried out. Mention has been made above of Damophilos and Gorgasos, who about 480 B.C. decorated the Temple of Ceres in Rome with terra-cotta statues and painted the cella; an idea of their artistic style can be gained through other great figures found in Sicily, the terra cottas of Gela and Megara. Perillos (Perilaos?), presumably a native of Akragas, designed the bronze bull in which the Akragantine tyrant Phalaris roasted his victims — a work that evokes Minoan echoes, along with the cow of Pasiphae and the Trojan Horse. The statue of Dionysos Morychos, by Simmias, son of Eupalamos of Athens, which was said to be of "cork stone" (φελλάτας), was perhaps of porous limestone. Dameas of Kroton executed his statue of the victorious athlete Milon (after 532) in bronze. A statue of Apollo in boxwood, the head gilded, stood in Olympia, a votive offering from the citizens of Lokroi hoi Epizephyrioi. Akron, son of Praton, was born in Selinous. Klearchos of Rhegion, reputed to be the master of Pythagoras, created the bronze *Zeus Hypatos* in Sparta, assembled from separate pieces, hence probably worked in the *sphyrelaton* technique. Mikon, son of Nikeratos, executed the portrait of Hieron II of Syracuse in Olympia (3d cent. B.C.). It must be remembered that artists of Greece proper had also worked for the west: Onatas of Aegina and Hagelaidas of Argos worked for Taras, and Kalamis of Phocis made the race horses of Hieron I in Olympia. The activity of these Greek artists is reflected in the similarities to works of the mother country seen in western Greek terra cottas and small bronzes.

Whether the marble sculptures found in Sicily and southern Italy are the work of Greek or of Italic artists has for some time been disputed, but the argument is really a matter of terminology rather than of fact. There is no question that southern Italy imported both forms and works of art. It is also true that in the Greek colonies the inhabitants were mostly Greeks, and this must hold for the artists, too. Naturally, from the 7th century on, indigenous imitations of the art of Greece proper, both in sculpture and in pottery, were being made. In the course of time this folk art increased in quantity and quality. It is difficult to separate the Greek stylistic contribution from the local one in a given work: the very essence of the art of Magna Graecia and Sicily is this mixture of stylistic elements. The more a work is Greek in its forms, the more likely it is to have been made by a Greek artist, whether one who had lived for generations in the west or one who had come there to execute it. The more a work tends toward the nonnaturalistic and abstract — as in Siculan and Calabrian sculpture in particular — the more plausibly it can be placed in the Italic artistic milieu. In limestone and in terra-cotta sculpture the Italiote style did not begin to develop until the 5th century; it can be recognized at least in work of that period from Taras, Syracuse, and Selinous.

Sculpture worked in Greek insular marble presents a different problem. The keen business sense of the Greeks would hardly have permitted them to export blocks of marble double the weight of the ultimate statues, risking the presence of internal flaws — cracks, bands, or dark spots — as well. Add to this consideration the fact that there was a steady demand among Greeks in Magna Graecia and Sicily, as in Egypt and southern Russia, for certain predetermined types of marble sculpture for funerary and other religious purposes: kouroi and korai, sphinxes and sirens, funerary steles, votive reliefs, lamps for temples, and, in the Greco-Phoenician border territories, anthropoid sarcophagi. It seems much more logical to assume that these were mass-produced in the quarries of Paros and Naxos and then exported than that the marble was exported to the western colonies to be worked there. If this hypothesis is correct, the kouroi in Metaponto, Megara Hyblaia, Lentini, Grammichele, and Locri, the korai from Taras, Garaguso, and Syracuse, the funerary steles in Syracuse, and the sphinxes from Megara, as well as the marble lamps from Selinous, must be considered — in so far as they conform with objects found in Greece — not as products of Greeks working in the west but as exports from Parian, Naxian, and other Greek workshops.

The problem takes on yet another aspect in the case of significant single works such as the enthroned goddess from Taras (PL. 65), the so-called "Ludovisi Throne" (PL. 63; III, PL. 350), and the torso in Agrigento (probably once part of a group). Here too it is less credible that a heavy block twice the weight of the relief or statue was imported and worked in Sicily than that the work was executed (as is still done in Carrara) in the area in which the marble was quarried. For these works there is no choice but to analyze them stylistically and attempt to relate them to kindred works from Greece or Italy. Since marble sculptures were probably in great demand, the possibility must be entertained that they were executed by itinerant sculptors who went in search of commissions, much as in later times the medieval masters traveled from one cathedral town to another.

*Marble sculpture.* The earliest piece of marble sculpture found in the west is the late Daedalic head in Agrigento. The granular marble, unquestionably from Naxos, as well as the style, which is somewhat old-fashioned for the period (ca. 595), points to its being an imported product rather than the work of a Siculan artist. Similarly, the verdict on the Selinuntine lamps must be that they were mass-produced in the Cyclades and exported as finished products.

The problem of the marble sculpture of Magna Graecia and Sicily presents itself most clearly in the sculpture from Selinous (PLS. 58, 59). It can hardly escape the observant viewer that the limestone metopes of Temple E (Palermo, Mus. Naz. Arch.) show, both in composition and in form, a typically West Greek character. This becomes still more apparent when they are compared with contemporaneous Greek sculpture: the movements in the Selinous works are rather awkward, sometimes peculiarly violent (Athena), and the drapery, notably in the metope of Athena and the Giant but also in the sculpture of Hera is rendered in a slightly archaizing style typical of the west. On the other hand, some of the marble heads — only the female ones are carved in this stone — are modeled in a pure Greek, indeed Parian, idiom. The marble female heads, particularly of Hera (PL. 59), of Artemis, and of the so-called "Graces," patently conflict in style with the limestone metopes. In these heads the formal differences between the Greek and Italic currents are especially evident. While the heads of Artemis, of Hera, of one of the "Graces," and of the two strongly agitated figures have a clearly Greek cast, there is in the head of the Amazon a certain realism, a tendency to characterization in formal terms. This is apparent in the pained lines around the mouth as well as the unusual motif of the clenched teeth, visible between half-open lips, and in the slightly contracted facial muscles. None of these occurs so forcefully or clearly in the art of the mother country at such an early date. It can be assumed that the atelier which produced this head, certainly the work of an artist who had assimilated the formal language of the Hellenic west and given it an Italic accent, also produced the Athena from Palestrina in New York (PL. 68; G. M. A. Richter, *Catalogue of Greek Sculptures*, Oxford, 1954, no. 79, pl. 28) and the larger than life-size head of a sphinx in the castle of Adolphseck, in Germany. Still more markedly Italic in character is the fragment of a face from Selinous (Palermo, Mus. Naz. Arch.) that in its unsure proportions and sterile execution, especially in the carving of the eyes, betrays the hand of a sculptor in whom the Italic temperament, despite efforts to assimilate Greek stylistic elements (the connection with Aeginetan sculpture is apparent), prevails even more noticeably than in the Amazon master. That several artists should collaborate in the creation of one metope may seem improbable, but we know from ancient tradition that frequently two, and sometimes even more, artists worked together in the execution of a single group.

The implications of the gradation toward the Greek so evident in the metope heads from Selinous — and of the fact that some of them are pure Greek — have been unexpectedly confirmed by some similar heads from Cyrene (some still in Cyrene, some in Br. Mus.), certain of which could even have been sculptured by the same hand. They too are made of a granular insular marble. The atelier in question, which was probably Cycladic, also worked for the island of Thera. In

regions poor in marble the production of such heads, in which insular marble was used only for the hairless parts of the face, can be followed from the 6th century to the Roman Imperial age. In the Hellenistic and Imperial periods Alexandria and Cyrene particularly seem to have favored this practice. When heads of this type are carved of Italic marble, as are some of those from Selinous, it is not always easy to establish if, or to what degree, the Italic concept of forms permeates the work; for in the development of the art of Magna Graecia the essential point is that artists coming to the west from Greece adjusted their artistic idiom to the new homeland with especial felicity when the polis, the urban community in which they found themselves, had achieved cultural and artistic individuality. This is particularly evident in 5th-century Taras, Kroton, Syracuse, and Akragas, which politically and culturally had acquired a physiognomy of their own and therefore could no longer be considered merely offshoots of the mother country.

There have come down to us a great many works in marble by sculptors who no longer had any close contact with the art of the Cyclades, and who had probably been living in the west for generations. The late archaic Nike of Sicilian marble in Syracuse (Mus. Arch. Naz.) is related to the korai of Paros but differs from them considerably. In like fashion, the figures on a marble pediment from Syracuse and the head of a youth from Leontinoi (PL. 67), which is related to the work of the Eretria master, may be considered typical West Greek works, and the same is true of two small marble heads from Paestum, by the same hand as the Leontinoi head, and the *Athena* (?) in the Museo Barracco (PL. 66). The head of Athena in Taranto (Mus. Naz.) is probably from the Niobid master's workshop, which seems to have executed many pediments with Niobids for buildings in Magna Graecia. In the early years of the Empire the most important of these was brought to the Temple of Apollo Sosianus in Rome, and later moved, in part to the Horti Sallustiani. Study of this master can throw light on the problem of Magna Graecian marble sculpture. For the figures in Copenhagen (Ny Carlsberg Glyptotek) and in the Palazzo dei Conservatori in Rome, presumably executed by his pupils in Magna Graecia, clearly demonstrate the transformation that was taking place in local sculpture: perhaps the most striking example is the *Apollo* (Rome, Conserv.), which, in accordance with late-5th-century Tarentine taste, had been complemented by flowing hair in bronze. The Niobid master seems to have been connected with the workshop of Theodoros of Phokaia, who executed the sculpture of the tholos in Delphi and worked in Skillous. The results of the same process can be seen in the horse's head from Taranto in Zurich (Arch. Samml. der Univ.), the pediment figures executed in Lokroi about 430, the "Humphry Ward head" in the Louvre, a head from Cumae (*MPiot*, XXXIV, 1934, pl. 2), a head from Monte Porzio Catone (E. Paribeni, *Museo Nazionale Romano, Sculture greche del V secolo*, Rome, 1953, no. 81), and several other pieces. The special charm of these lies in the less tectonic working of the head, the somewhat uncertain relation of the expressive parts of the face (mouth, nose, eyes), and some out-of-date stylistic elements — for example, the ringlets on a head in Como (Mus. Civ.) — which are slightly mannered.

The Italic component in West Greek art comes through much more strongly in some works undoubtedly of Magna Graecian authorship whose artistic vocabulary differs profoundly from that of the Greek motherland. This group is most strikingly represented by the head of Apollo from Cirò (P. Orsi, *Templum Apollonis Alaei*, Rome, 1933, pl. 19; the feet and one hand have also been recovered). In its general appearance and technique, the work is related to the heads found in great number in Sicily, but it differs in the far more summary handling of structure and in the soft fullness of the face (PL. 69). The taste for full, indeed too soft, faces is also encountered on Tarentine vases and Siculan coins of the late 5th century. No less evident is the taste for too realistic, overly florid, even ugly forms, such as the pudgy feet of this statue.

Nevertheless, on account of its great stylistic similarity to Tarentine terra cottas and limestone figures, the head of Apollo from Cirò must be classified as Tarentine, with the reservation that its style shows considerable Italic influence. Various sculptures found in the vicinity of Selinunte were probably also executed in western Sicily. The tendencies that mark all these works are seen even more clearly, at times together with a certain provincial charm, in the colossal head of the Ludovisi *Juno* (Rome, Mus. Naz. Rom.), in the head in Syracuse (Mus. Arch. Naz., no. 16968) whose hairdress follows Greek formulas, not altogether successfully, in the *Zeus Meilichios* from Selinunte (Palermo, Mus. Naz. Arch.), and in the Cassandra relief in the Galleria Borghese, Rome. Against the background of these numerous works of middling quality, the magnificence of the best of Magna Graecian sculpture stands out sharply. One thinks of such works as the unique mid-4th-century head of a goddess from Taranto in Kansas City (Nelson Gall. of Art and Atkins Mus.) and the relief with maenads in Rome (Mus. Naz. Rom., no. 52059), with its bold back view of one of the maenads, the foreshortening of the head of the other (whose flowing hair is reminiscent of Tarentine vase scenes), and the slightly mannered drapery.

What distinguishes these sculptures from those of the mother country, in particular from the Ionian world, which had the strongest influence on western Greek art, is a difference not in quality, as is sometimes held, but in modeling and texture. The artist did not take the organic structure of a body or a head as his starting point: he strove to express in stone the softness of surfaces. This individuality is seen, particularly around the eyes, in the splendid head of a goddess in Kansas City, which also has the soft, full cheeks and the "collar of Venus" creases in the neck.

The art of Sicily and Magna Graecia also produced some kouros and kore types of its own; but we have a clear idea only of the latter. The earliest surviving kore is a bronze from Lokroi (*NSc*, 1913, suppl., p. 51, fig. 65). The type, in terra cotta, spread as far as central Italy, an example having been found in the Roman Forum; differing from the usual Ionian examples, this seems to be related to East Greek works such as a kore in the Berlin Museum (*Antike Denkmäler*, III, 1909–26, p. 52, fig. 9). The running Nike of Syracuse (Mus. Arch. Naz.), which may have been an acroterium for the Temple of the Deinomenids, is later, about 500 B.C. The goddess wears her oblique cloak differently from the Greek korai: the edge that crosses the breasts is smooth and has broad folds falling from it on the diagonal. In the hair streaming across the chest a Parian influence can perhaps be glimpsed. The uncompleted marble kore in Taranto found near Saturo seems — so far as it is possible to judge — to be related to this type. Whether the kore was roughed out from a block of marble (possibly Italic) that had been imported to Taras or whether the preliminary carving was done in Paros and then transported to Taras in its unfinished state cannot be established. In any case it is of interest that this figure has the same arrangement of drapery over the breast as the Nike of Syracuse. The shortness of the chiton, a feature found neither in Greece nor in the east, is typically Italic. It may be that this kore is an archaistic work from the age of Pasiteles, a sculptor of Magna Graecia in the 1st century B.C. The Guicciardini kore in Florence (Pal. Guicciardini) and the kore from Castel Porziano near Rome (Mus. Naz. Rom., no. 30067; E. Paribeni, op. cit., no. 76) have the same characteristics, even to the detail of the small *kolpos* (loose fold) under the left armpit. The Sicilian terra cottas from Grammichele (Pace, II, 1938, fig. 73), the bronze supports from Locri (*NSc*, 1913, suppl., p. 3 ff.), and the terra-cotta *arula* (small altar) in Naples with scene of Iris running afford evidence that this style of diagonal mantle was characteristic of Magna Graecia and Sicily. The arm support at the side of the figure does not necessarily exclude the possibility of a date of about 500. All these problems would vanish, however, if the hypothesis were accepted that these are works of the school of Pasiteles.

The continuity of development that marks the art of Greece proper is missing in the marble sculpture of Magna Graecia and Sicily. It seems more as if we were dealing with workshops that traveled from city to city, executing marble statues for the sanctuaries as they went along. Obviously this could

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

have been the case only if continuous contact was maintained with sculpture workshops of the Cyclades, and if the marble ordered by western Greek artists was prepared and blocked out there.

For an idea of the sculptural achievement of the western Greeks, we need only consider the "Ludovisi Throne" in Rome (PL. 63; III, PL. 350) and its counterpart in Boston (Mus. of Fine Arts). The Rome relief, three-sided, representing on the front a goddess (Aphrodite?) emerging from the sea or from a ritual bath, is the work of a master of the northern Greek school. The Boston throne is so similar in its unusual structural form, its ornamentation, and also its style that it could only have been executed under the influence of this same master. Of particular relevance to our discussion is the fact that the front of the Boston relief is entirely different in composition from that of the Rome relief. Instead of figures unfolding shallowly against the background in large sweeping contours of low relief, the three figures on the front of the Boston work are carried out in accordance with the completely different concept of spatiality of the western Greek marble sculptors. This is evident not only in the figure of Eros, which, sculptured almost in the round, stands out in high relief, but also in the two goddesses, sketched not merely in outline but in terms of the spatial realities of bodily dimensions, with foreshortening and sharp intersection of forms. But, above all, the movement of the arms of the goddesses transcends the boundaries of the relief, belying the existence of the background and creating the effect of figures that seem to emerge like flowers from the volutes and palmettes. Thus the background of the relief, probably once painted blue, remains isolated, and the three figures must have created the illusion of freestanding forms, invisibly supported by the surface of the relief. Not only in the composition as a whole but also in the forms, most of all the faces, there is a delicate, slightly mannered echo of the late archaic style, especially in the head of Eros and the animated countenance of the smiling goddess. The extraordinary grace of these heads, allowing for certain differences in quality, recalls several terra-cotta heads from Medma (near mod. Rosarno) and Locri (Reggio Calabria, Mus. Naz.). The sides of the Boston throne, quite otherwise, are pure Greek — in concept and in the modeling of the heads. Particularly in the treatment of hair they are artistically inseparable from the Cycladic funerary steles as well as the fragments in Frankfort on the Main (Liebighaus). A reasonable explanation of the discrepancy between the front and the sides of the Boston throne is that the Eros relief was executed by an artist who, though having many connections with the Aphrodite master, was drawn in a different direction by the West Greek temper and the western sculptural tendencies; the two sides could have been the work of a hand very close to, if not actually identical with, that of the Aphrodite master.

No satisfactory interpretation of these magnificent sculptures of Magna Graecia has yet been found: the difficulty arises from the fact that both reliefs obviously represent typical West Greek cult legends or myths. It seems to this writer that the interpretation of the "Ludovisi Throne" as showing the ritual bath of a goddess, be it Aphrodite, Hera, or Demeter, is preferable to the interpretation of the scene as Aphrodite rising from the sea. The two female figures on the sides should be interpreted not, in a modern abstract sense, as representations of earthly and heavenly love but as familiar mythological personages, handmaidens of the goddess — one bearing a sacrifice of incense, the other playing the flute — attending her as she emerges, reborn, from the fountain of youth. In the subject of the central Boston relief, Eros weighing the love fates of two goddesses, there is an interesting iconographical difference from the art of the Greek motherland, in that the heavy scale signifies a happy outcome and the light scale is a cause for dejection. Each of the figures on the sides is related in significance to the near goddess: the handsome lyre player must have a mythological connection with the mournful figure, while the old nurse near the fortunate one may have been holding the figure of a child, perhaps lost or removed during the transfer of the relief from the sanctuary in Magna Graecia to Rome. To the workshop of the Ludovisi master, whose later work it is possible to follow to some extent, can perhaps be attributed the head of Artemis in the Aktaion metope from Selinunte (Palermo, Mus. Naz. Arch.). Stylistically related to the "Ludovisi Throne" is another relief in Rome, the so-called "Leukothea Relief" in the Villa Albani; this could have come from the same workshop, were it not that the gradation in depth of the three figures in front of the goddess indicates an attempt at perspective not met with in Greece proper. The influence of this master is also traceable in the votive reliefs of Lokroi, and it is probably not mere chance that their period of production is limited to the years in which he was active in Magna Graecia (460–450).

The master of the Eros relief also seems to have left traces in Magna Graecia: the three women — probably taking part in a mule race, a familiar activity in Sicily — on a relief fragment in Copenhagen (Ny Carlsberg Glyptotek, no. 31) have a marked similarity to the goddesses of the Boston work. A type of head frequently copied in Roman times, and often coupled with Dionysos on a herm, can perhaps be traced to the same workshop (F. Cumont, *Catalogues des sculptures et inscriptions antiques des Musées Royaux du Cinquantenaire*, Brussels, 1913, no. 1).

[NOTE. It should be stated that questions have been raised regarding the authenticity of the Boston throne. See bibliog. of Möbius (1958); see also FALSIFICATION AND FORGERY.**]

*Pythagoras.* The art of Pythagoras is a story in itself. Born in Samos, he must have been forced by the disturbances in eastern Ionia in the years around 500 to emigrate to Rhegion. In an inscription that survives he declares himself to be a Samian, but ancient historians called him a native of Rhegion and related him to Klearchos of Rhegion, who has himself been connected with 6th-century sculptors of the northern Peloponnesos (Dipoinos and Skyllis). In the written tradition, Pythagoras appears as an innovator in the field of Greek sculpture: he was considered a precursor of Lysippos (q.v.). and hence placed at the end of the 5th century. But such a dating is not possible if he was a pupil of Klearchos. Like many other Greek sculptors, Pythagoras can be dated on the basis of the victories of the young athletes whose statues he made for the sanctuaries to which they brought their trophies; the earliest of these took place about 480, the latest about 448. A dating in the first half of the 5th century is supported by the fact that by tradition he is coupled with Myron: both sculptors were interested in the portrayal of violent movement. We can get an idea of Pythagoras' art from the ancient references which state that he was the first to distinguish himself primarily by the rhythm and symmetry of his sculpture. But the words conveyed a slightly different meaning: "rhythm" to the ancients denoted suddenness and regularity, as in the motion of a ship rising and falling on the waves, and "symmetry" was applied not to the equality of two halves but rather to the correspondence of the parts (ἁρμονία τῶν διαφερόντων). Ancient writers, moreover, credit Pythagoras with being the first to represent the sinews and veins and assert that he sculptured hair more faithfully than Myron. It can therefore perhaps be deduced that Pythagoras did not altogether adhere in his sculpture to the Greek ideal of the greatest possible harmony but put a higher value on the realistic representation of the figure.

There are suggestions from other quarters that may perhaps help us to visualize the art of Pythagoras. One such source is the late-5th-century coinage from Kroton. On some coins, a kneeling figure of Apollo killing the serpent Python is shown beside a tripod of a type in use since the 6th century. These coins are, of course, too small to give us an idea of the individuality of the style, but the vehemence of the movement, the sharp twist of the torso, and the crossing of the arms do give us an inkling of the liveliness of Pythagoras' figures, so praised by the ancients. A *claudicans* (limping figure) by him — which Lessing rather convincingly identified as the lame Philoktetes — was famous. There are a number of Roman gems representing a limping man, in a style that can hardly be earlier than 4th-century. A wall painting in Pompeii with Philoktetes leaning on a stick seems to be closer to the 5th-century style, but it is in too poor a state of preservation to serve as a reproduction in any real

sense. Of more help, perhaps, is a statuette of an athlete from Adrano (PL. 70). Compared with the Greek figures of young champions, this excellent bronze is distinguished for its proportions — the length of the body, the smallness of the head, in other words, all that the ancients saw in the work of Pythagoras. Yet this statue falls short of a certain nobility of aspect. It differs from all the Greek examples, chiefly in the more sweeping arm movement and the alert pose of the whole figure, especially the head, which is closely related to the original head of an acrolith of Athena in Rome (Vat. Mus.). It cannot be asserted that these two works, the statuette from Adrano and the head of Athena, were creations of Pythagoras or his workshop; but they certainly originated in an artistic circle that differed not only from the Greek but also from what we know of the West Greek, and, in the striking features just pointed out, they stir remembrance of the traditional description of Pythagoras' art. The bronze figure of a young *adorans* in New York (Met. Mus.), probably acquired in Smyrna, a city opposite Pythagoras' native island, is, like the Adrano statuette, outstanding for its accentuated rhythm; it is probably some twenty to thirty years earlier. The two works are related to the figure of a man — Epimetheos or Hephaistos — brandishing an ax, in Washington, D.C. (PL. 70), a bearded head in the British Museum unquestionably from the same workshop, a lost bronze of the same size (*ÖJh*, XXXIX, 1952, p. 59), and a statue of Perseus (E. Langlotz, "Ein verkannter Perseus?" Ἀρχαιολογικὴ Ἐφημερίς, 1953–54, part 2, pp. 20–23).

Among the representations of Perseus in Greek 5th-century art, two types — which continued in the illumination of medieval astronomy manuscripts — can be distinguished. One type, the Perseus triumphantly raising on high the head of the Gorgon, is represented on many Italic vases of the late 5th and early 4th centuries and on Etruscan bronzes and mirrors. It is no accident that Benvenuto Cellini's *Perseus* in the Loggia della Signoria, Florence, follows this Italic type, and from Roman copies we can form a fairly clear idea of it. As has long been noted, the *Huntsman* in the Capitoline Museum in Rome, which is a Roman portrait statue of the freedman Polytimos, is a good copy of an Ionian Greek work of the middle of the 5th century B.C., except for the head, which dates from the period of Gallienus. The hare that the hunter is holding up and the tree trunk are undoubtedly additions by the Roman copyist, but the raised right arm must have been in the Greek original. The fame of the prototype is indicated by the existence of two other copies, one in Naples (Mus. Naz.) and one in Florence (Mus. Arch.). The head of this Perseus type can be recognized again in the head erroneously placed on the *Athena* in the Villa Albani, Rome, in the 18th century, since the winged dogskin helmet and the short curly hair are attributes not of Athena but of Perseus. The reconstruction of the head and body, though in plaster, seems to fit into the stylistic picture that has been sketched of Pythagoras' art, but hardly any trace of his artistic idiom remains, for both fragments have been thoroughly reworked by an 18th-century classicistic restorer. The Ludovisi herm of a discus thrower (PL. 70), which is perhaps the clearest expression of the antinomy of movement and the general bearing of a professional athlete, could also be placed in the circle of this master. The Valentini torso (Rome, Mus. Naz. Rom.), which has not yet been adequately interpreted, is from a later period. Also of later date is the statue of a bearded man, preserved in two Roman bronze copies, whose prototype goes back to the late 5th century B.C., but whose form belongs to the artistic sphere of Pythagoras; this may have been a work by a student of his, perhaps Sostratos.

Some confirmation of these attributions may be afforded by Tarentine terra-cotta molds, which reproduce not only the triumphant Perseus (though without head and arms), but also the Valentini torso. It was evidently common in the Hellenistic period for Tarentine sculptors in clay to reproduce famous works of art for their city.

*Limestone sculpture.* With fine marble both rare and costly, it was only natural that sculptors in Magna Graecia and Sicily should have used limestone for their works more frequently than sculptors in the mother country; they may even have preferred it to marble, since the softer material made it possible to obtain great expressive force and a freer treatment of plastic volumes in the figures and favored the painterly enrichment of surfaces. Because of the relative softness of the limestone, the statues made of this material required the application, as in architecture, of a coat of stucco to prepare them for polychrome. Cult statues were also executed in limestone. In Taras, limestone funerary statues in small aediculae were common: those intended for the richer graves had marble heads. The use of limestone for decorative friezes and small reliefs was especially frequent.

The oldest surviving limestone head is one with the polos, from Laianello (Syracuse, Mus. Arch. Naz.); presumably part of a cult statue, it may have been produced by a Syracusan sculptor working in the Corinthian tradition. The developed modeling of the ears and the refined gradation of the beaded curls on the neck point to a date in the neighborhood of 600 B.C., the period of the late Daedalic bronze in Boston (II, PL. 33). The relief with two sphinxes from Caltagirone (Syracuse, Mus. Arch. Naz.) also seems to be Corinthian-Syracusan: in the frieze above the sphinxes are dancers recalling those on Middle Corinthian vases. To the same period belong the badly damaged torsos of female divinities, such as the Meter with a lion in her lap, from Akrai (Syracuse, Mus. Arch. Naz., no. 14366), and similar statues from Grammichele. While these works follow the best Corinthian tradition, the xoanon from Megara Hyblaia, in Syracuse, seems, like all the sculptures from Megara Hyblaia and Gela in fact, distinctly provincial — generally inferior in quality to those from Syracuse. A kore in high relief from Monte Casale (Syracuse, Mus. Arch. Naz., no. 47061), which is sculptured almost in the round, follows Ionian kore types; it is strongly Siculan in character (PL. 66). The head of a kore from Megara Hyblaia (Syracuse, Mus. Arch. Naz., no. 7734), is Greek and, to judge from the polos, may have belonged to a cult image. The bearded head from Grammichele (Syracuse, Mus. Arch. Naz., no. 23160) more closely approaches the Siculan manner; this is the work of a sculptor with a linear style, but it lacks the vigor of the master of the Selinous metopes.

Better known than the freestanding sculpture in limestone is the architectural sculpture. What remains of the temples of Selinous is chiefly the metopes. The metope with Apollo, Artemis, and Leto (Palermo, Mus. Naz. Arch.) seems to be of an early period and, like the metope with a sphinx and the metope with the rape of Europa (PL. 58), could have been executed shortly before the middle of the 6th century. Selinous lay in the westernmost zone of the Greek world, and while economic development was rapid, owing to its closeness to the Punic trading area, culturally it lagged behind Syracuse and Akragas. The sculptural forms of these metopes show no refinement of detail, probably because they were meant to be seen from a distance and also because, it must be assumed, the finished effect was supplied by the painting. The same is true of a metope with the Gorgon, from Gela, in Copenhagen (Ny Carlsberg Glyptotek, no. 6*a*). More important, even if not so early as has often been maintained, are the metopes of Temple C in Selinunte. Their sculptor was still working in the Daedalic tradition of the years around 600 in his handling of body structure and gestures. The types, above all, Apollo's (?) quadriga, represented frontally (Palermo, Mus. Naz. Arch.), Athena and Perseus and the Gorgon (PL. 58), and Herakles with the Kerkopes (Cercopes), are unthinkable before the middle of the century, despite the fact that the heads of the Kerkopes in the last-mentioned are still completely Daedalic (I, PL. 343). Other formal details — particularly the stylization of the short chiton, the exaggerated rendering of the inner corner of the eye, and the type of the head of Pegasos — preclude the possibility of a date earlier than 530 for the metopes. It is precisely the mingling of differing artistic and stylistic levels in these metopes that makes their appearance in this farthest outpost of the Greek world significant. They are the outstanding relief works of Greek art of the 6th century in Sicily. In comparison with metopes of the mother country, they show an accentuation of the spatial depth of the relief: the quadriga, for example, seems almost to be enclosed in a boxlike space, so deep do the figures reach.

In the architectural sculpture of Magna Graecia the metopes of the two Doric buildings of the Heraion on the Sele near Paestum have a place of the greatest importance. They can be dated only approximately — about the middle of the 6th century. They are interesting in that they show a blending of Greek and West Greek elements different from that found in the metopes originating farther west, in Selinous. Illustrative of this blending is the architecture of the "Treasury," with its already outmoded hipped roof and admixture of Ionic elements; its close ties to the Temple of Athena (Ceres?) in Paestum are clear, although the latter is of a higher order. What has been said applies also to the rich decoration of the metopes. The meaning of the representations, which are taken from the myths of Herakles (I, PL. 343), of the Trojans, and of the gods, has not been established but must be related to the founding of the sanctuary. Probably because of interruptions caused by war, the metopes were not all completed; perhaps those in lower relief were finished with paint at a time when there were no longer the resources or the interest to continue the carving to completion. Decidedly Magna Graecian is the imaginative wealth of the representations and their exceptional graphicness. In Greece the scene of a hero fleeing from his pursuer would hardly include, on a metope, the detail of a column of the temple in which the fugitive seeks refuge (PL. 60). The thickset proportions of all the figures recall those of the Attic "little masters," without showing any relation in style. The running girls bring to mind Spartan-Tarentine figure types, particularly in the rendering of the drapery; the fragment of a centaur (PL. 60) shows the type of centaur and of Seilenos head known to us through Chalcidian vases. Thus several West Greek stylistic currents meet in the pages of this veritable picture book of Magna Graecian myths. Since Sybaris was the parent city of Poseidonia (Paestum), it can be supposed that the artists working at the sanctuary on the Sele went there from Sybaris to execute the metopes.

The metopes of the major temple of the sanctuary, probably late-6th-century, are more minutely executed, more elegant in the treatment of movement, especially that of the recurrent running maidens (PL. 60). The energy of their motion exceeds that usually seen in Greece proper, and the rather full forms, especially the breasts, and the shape of the heads, put one in mind of East Greek works such as the frieze with chariots of the Treasury of the Siphnians in Delphi.

Unfortunately, only two metopes of the other buildings have been found. These show yet another nuance of the style of Magna Graecia. Particularly interesting is the representation of a footsoldier in Chalcidian style, which resembles forms on a clay *arula* in Reggio Calabria. The chiseled metope of Herakles may date from the early 5th century.

A fragmentary bearded head from Sybaris (mod. Sibari; PL. 66; *NSc*, 1932, p. 132) perhaps also came from an architectural relief, either a metope or a small pediment. It is important as the only sculpture surviving from that city, which was destroyed in the year 510. Its vigorous execution, suggestive of woodcarving, is strongly reminiscent of the pediment of the Treasury of Megara in Olympia, but it could have been made by a sculptor of Magna Graecia trained in the Doric tradition. On the other hand, the small metope with Europa from Paestum (Naples, Mus. Naz.), in a limestone resembling sandstone, is obviously related to Ionian forms and is essentially more refined in workmanship.

Probably from the turn of the century are the metopes from Selinunte with two running figures. Part of a cycle, they seem to represent the rape of a woman, perhaps Persephone. A certain awkwardness of movement, the parallelism of the parts, and the late archaic grace of the features give this work its special character. The fragments that remain of the early-5th-century metopes of Temple F show not so much the grace as the sculptural vigor of the West Greek severe style, particularly in the expressive motif of the giant in defeat (PL. 59).

As in architecture, so in sculpture the Greek influence made itself felt more strongly in the decades of the Persian Wars. Thus a small metope from Selinunte (PL. 59) representing a goddess animatedly turning toward Hermes(?) epitomizes in the late archaic linearity of the drapery and the grace of the faces, the charm of Selinuntine sculpture of the early 5th century. This comes to its fullest expression in the large metopes from Temple E, the most magnificent representatives of the art of the western Greeks in Sicily (Palermo, Mus. Naz. Arch.). The hand of the West Greek master is apparent in the characterization of the two divinities in the metope of Zeus and Hera — the dignity of the goddess as she stands before the amorous Zeus seated on his rock — and in the remarkable skill with which the Aktaion scene is depicted, with Artemis looking down at the leaping hounds. An almost brutal note is struck in the Amazon metope, with Herakles preventing the escape of the doomed Amazon — her face contracted in pain — by stamping on her foot. In the metope of Athena, conceived and executed by a less gifted artist, West Greek characteristics appear in their negative aspect: the schematism of the composition, which has led to a parallelism of parts, and the awkwardness of the collapsing giant cause us to wonder once more at the extraordinary unevenness of West Greek art. With these works the story of Selinuntine sculpture comes to a close.

Neither in Sicily nor in Magna Graecia have any important limestone sculptures dating after the middle of the 5th century been brought to light, except for a head in Sorrento (private coll.). It is not known whom this fascinating work represents. The fillets round the head suggest Dionysos; at any rate the features recall the Seilenos heads from Naxos, which would confirm the Dionysian connection. Presumably executed in the early 4th century, perhaps in an artistic circle originating in Naxos, this is the outstanding representation of the head of a divinity in Magna Graecian sculpture: in the pain-filled and despairing features, the typical West Greek transformation of the Greek concept of divinity through the religion and ethos of the western Greeks is seen at its clearest.

Nothing has been preserved of Syracusan 4th-century sculpture except a female torso (Syracuse, Mus. Arch. Naz.) based on Attic models. But from the age of Hieron II there are some important remains of sculpture, among them the caryatids from the large theater and some small tomb reliefs (Syracuse, Mus. Arch. Naz.). In addition, there are copies of an important group of Graces or Fates, now lost, in the votive reliefs from Camaro and Syracuse (Syracuse, Mus. Arch. Naz.); from these it can be deduced that the original work, which must have been well known, since it was still being reproduced in very late Hellenistic times, was made in the 3d century B.C. To this later period (presumably the years around 100 B.C., in which the city began to flourish again under Roman rule) belongs the relief of Artemis and Apollo from Akrai (Syracuse, Mus. Arch. Naz.), a most instructive work. Here the inherent tendency of West Greek art toward, as it were, baroque, overstated forms is particularly conspicuous. Apollo, his body strongly arched, is leaning on the omphalos; equally forceful is the stately stride of Artemis, her body crossed by intersecting groups of folds. The work is no longer a relief, strictly speaking, for these figures break away from the relief wall. The same period must have produced the Zeus from Solunto (Palermo, Mus. Naz. Arch.), in which the forms are loosening up in a "rococo" manner. An important head from Megara Hyblaia (Syracuse, Mus. Arch. Naz., no. 19049) illustrates the dissolution of late Hellenistic forms in Syracuse: the excessive slenderness, the strong development in depth, and the lack of coherence in the rendering of face and hair demonstrate the decline in the representation of form that took place in the 1st century B.C. As a portrait, this work shows the strained tenor of the time of Mithradates more strikingly than works produced in the mother country.

The Tarentine stone is much harder than the Sicilian and therefore particularly suitable for sculpture. From the fragments scattered in museums throughout the world we get an impressive picture of this highly individual art. Of temple sculpture there remains only one metope, with a warrior violently engaging the enemy (Brea, 1953, fig. 79), a masterly figure in which a magnified Scopasian influence is evident: the baroque strain in Skopas — the pathos — made him the favored artist in 4th-century Taras rather than the more restrained Praxiteles. The bulk of the Tarentine limestone figures come from the reliefs

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

of funerary monuments. Many capitals and architraves from these have been preserved, but attempts at reconstruction have not yet been undertaken, and for information we must turn to the representations on Apulian amphoras. There seem to have been three main types of funerary structures: the first, a cube decorated on all four sides with reliefs and supporting a statue or a tropaion; the second (not earlier than the 2d century), a high, four-sided, pillar-shaped monument; the third, much more frequent, the aedicula, a type often represented in south Italian vase painting. These *naiskoi* in rare cases enclosed a figure in the round (none earlier than the 2d century have been preserved), and sometimes they seem to have borne a large relief, of the type of 4th-century Attic gravestones. One of the earliest of the reliefs, a work of modest size representing two female figures (Brea, 1953, fig. 14), is related to late-5th-century Attic votive reliefs; the figures are perhaps Demeter and Kore. The simple, artless, still classic treatment of the garments demonstrates how closely bound to Attic art were the forms of Tarentine art of this period. In a relief fragment from Taranto in New York (Met. Mus.; Brea, 1953, fig. 12), which, it has been suggested, shows Electra and Orestes at the tomb of Agamemnon, the Magna Graecian idea of form is particularly well exemplified by the separation of the figures from the ground of the relief and the extreme flexibility that makes possible the S-shaped forms in which they are composed. Typically Tarentine as well are the effect of spatial depth in the relief, obtained in this case by the foreshortening of the altar and the strong contrasts of light and shade, and the emotion in the faces. The treatment of space is similar in one of the most beautiful Tarentine sepulchral reliefs (Brea, 1953, figs., 44, 45), a frieze with Herakles in Hades (Munich, Glyptothek, no 494) and Herakles and the Amazons (Taranto, Mus. Naz.). Marking this art as Tarentine is the framing — below, flowering springs; above, Ionic and Doric kymatia — as well as the delicate refinement and looser treatment of the figures. But the weakness of this sculpture is already apparent in the growing love for small, almost dancing, rococo-like figures. While the influence of Skopas' art is strong, especially in the representations of combatants (Brea, 1953, fig. 79), the influence of Lysippos, who worked in Taras, is also mirrored, in the later limestone reliefs; as in the Hellenistic art of Asia Minor, it led to the creation of more and more sentimental, baroque figures. The bold and exuberant imagination of these artists found magnificent expression in their battle scenes (Brea, 1953, figs. 90–98): it appears that, notwithstanding the severity of the Punic Wars, Tarentine art was in full flower up to the end of the 3d century; its decline, after the city lost its freedom in 208 B.C., is evident in the reliefs, with their slender figures clad in swirling masses of draperies. However, the flagging imagination still sometimes found expression, as in the reliefs with the motif of two figures rushing past each other toward the opposite side (Brea, 1953, figs. 116–18). Not until the 2d century did this art quite vanish, drying up as the artists monotonously repeated fleeing youths and women, with the figures becoming ever more brittle (Brea, 1953, fig. 120).

Limestone statues with marble heads must have been more common than is generally thought; for the most part, only the marble heads have survived the elements. It is the marble head and not the limestone body of the colossal Ludovisi *Juno* that remains, and there are numerous marble heads from Taranto that belonged to limestone statues. This is shown both by the unusual widening at the base of the neck, providing a larger surface for setting the head into the torso, and by the markedly erect stance, which probably lent security, since the heads were not mortised but merely glued in place. Only two female figures of this type have survived entire (Wuilleumier, 1939, pl. VIII), and these are late-2d-century, probably from funerary aediculae.

Works of a very different type, showing a masterly skill in the perfecting of form, are the vine friezes from Taranto, notably the fragment in Boston with the figure of a youth (Brea, 1953, fig. 58) and the relief in Paestum, in which the artist has foreshortened the twisting vines. Both these superlative decorative works embody the strong pictorial tendencies of the western Greek artists.

In Lecce, limestone reliefs were also used to decorate burial hypogea. The one frieze that has been preserved, in the hypogeum of the Palmieri, shows warriors engaged in violent combat; this work could date from the 2d century, as does the fragment in Budapest (Brea, 1953, figs. 53, 86), in which the turning of the heads of the horses toward the interior of the scene provides a startling demonstration of the West Greek interest in pictorial effect. In the 2d century Tarentine artists seem to have emigrated to central and northern Italy. A late Hellenistic stele in Padua (*Boll. del Museo Civico di Padova*, N.S., IV, 1928, p. 119) and a vine frieze with heads in the Vatican Museums, executed in Etruria after a Tarentine model, are both related to these Tarentine works. The relation between the Cyrenaic limestone reliefs and the Tarentine ones has not yet been clarified. There seems to have existed an artistic association of sorts, which naturally had ties with Asia Minor.

*Terra-cotta sculpture.* The terra-cotta sculpture of the western Greeks may be called, along with the limestone sculpture, the purest and most characteristic expression of their art. The terra cottas from southern Italy and Sicily not only outnumber those of the homeland but surpass them in beauty of workmanship and variety of type. Some of the terra cottas, precisely defined with putty knife and modeling pencil, are of an exquisite exactitude of execution that places them alongside the best toreutic works. Further, the western artists, much more than those of the motherland, made use of clay for large figures, both for the ornamentation of pediments and metopes of temples and for setting up in sanctuaries (images of gods and votive offerings). It must have been not so much the lack of marble that impelled the western Greeks to work more frequently in clay, nor the fact that the divine service and the cult and ritual of the dead required a greater number of terra cottas than in the Greek motherland; rather it appears that the demand for terra-cotta sculpture provided a welcome opportunity for them to carry out their artistic intentions, as did limestone sculpture, in a much freer manner — with imagination and yet with technical security — than is possible in marble and bronze. In particular, violent movement is easier to represent in clay than in marble, whose static laws can never be transgressed. Moreover, clay makes possible a painterly relaxation of surface — a deep-going modeling that gives a pictorial effect — and, especially, a heightening of expressiveness in the heads. Terra-cotta heads of the late 5th century from Taranto (PL. 74), Locri, Medma, and Naxos have a strength of facial expression not encountered in Greece until the Hellenistic era.

The point of departure for this rich terra-cotta sculpture was again Greek art. Naturally, the colonists of the 7th and 6th centuries at first imported from the mother country the ex-votos and images required for the worship of their gods and for their funeral rites, to say nothing of the terra-cotta statuettes that served as unguentaria. All these were of course imitated, and consequently the same types are found repeated in different clays — particularly in the 7th century, when almost all votive images were in the form of the xoanon. But by the end of the century the major art centers of the west began to modify the traditional types, adapting them to their needs. It is interesting to note how the imitation of imported types such as the East Greek unguentaria in the shape of korai and the peplos figures of the 7th and 6th centuries contributed to the development of the artistic idiom. At the same time, the imitations reflect the local religious ideas and tastes of the makers, and they bear the imprint, to a greater or lesser degree, of the specific desires of the Siculan and Italic natives living near the Greek cities for whom the votive images were destined. Because of their portability, the terra-cotta figures spread throughout Italy, to the southern coast of France, and to Spain as well. Campania seems to have been one of the main centers of production. Undoubtedly these terra cottas contributed greatly to the Hellenization of central and northern Italy.

The oldest terra cottas that have been preserved are probably those found in Syracuse and Metaponto. The head of a warrior in Syracuse, which may have been made in the city immediately after its founding (ca. 733?) corresponds to the late Geometric phase. Of a higher quality are the terra cottas from Metaponto,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

whose execution, far surpassing that of contemporaneous Greek terra cottas, strikingly reflects the development of the Daedalic style. The models seem to have been mainly Corinthian; above all, the early Daedalic figures recall works from Perachora, while later ones, with curled wigs, recall those found in Rhodes. However, the finds are insufficient to establish a definite connection between the types from Metaponto and any of the centers of the so-called Daedalic sculpture of the 7th century. The 7th-century terra cottas from Locri and Selinunte are, on the other hand, surprisingly primitive. The Daedalic forms of the kore seem to have survived in the west much longer than in the motherland: in the 6th century they still inspired the important wooden figures from Palma di Montechiaro (near Agrigento).

The oldest Tarentine 6th-century sculpture is understandably related to Sparta, as is especially apparent in the Oxford kouros (Ashmolean Mus.). But it was in Taras itself that the tendency to realistic expression that was to be typical of late West Greek art seems to have appeared at an early date, as witness the Gorgon head in New York (Met. Mus.), whose grimace has an intensity lacking in the more restrained representations from Greece.

As might be expected, Syracuse, which, together with Taras, was already in the 7th century one of the most important artistic centers of the west, closely followed Corinth in forms and types. But the greater liveliness and the intensification of fantasy as compared with the Greek prototypes are unmistakable. Especially fine examples are the reclining lion and the female centaur with the head of a Gorgon (both, Syracuse, Mus. Arch. Naz.), the latter unquestionably a typical western variation, scarcely to be seen in the mother country, of the hybrid creature.

Toward the middle of the 6th century a strong Ionian influence is everywhere discernible. This is, no doubt, due to the influx of the eastern Greek colonists who, harassed by the Persians, were abandoning Anatolia. The eastern component is evident in the large number and variety of unguentaria modeled in the shape of korai. The possibilities for duplication inherent in the terra-cotta technique doubtless contributed to the rapid diffusion of fashionable types. The wide distribution, particularly in Sicily, of the terra-cotta busts that in Greece proper were found in any quantity only in Boeotia and the Dodecanese may be due to a connection with funeral rites. Outstanding in workmanship are the busts from Grammichele (Syracuse, Mus. Arch. Naz.) in which an unbroken series from the late archaic period to the middle of the 5th century B.C. can be traced. In these the Doric, or perhaps the Corinthian, influence is stronger — in the structural clarity of the face and the accentuation of the eyebrows by means of a ridge and in the use of color. But side by side with these busts occur others that have a strongly Ionian cast. A head of Athena in Agrigento (PL. 66) is an especially lovely example. This is most probably not one of the mass-produced pieces cast from a mold; it is a work modeled by hand to the last detail and probably belonged to a larger group of works, unfortunately lost. Its terse, precise style is strongly reminiscent of the sculpture of Aegina, whose influence was felt throughout the Greek west. Likewise out of the ordinary, indeed worthy of comparison with the best archaic korai from the Acropolis of Athens, is another head from Agrigento. The delicate beauty of the slender face, the mouth curving in a half-smile and the pointed chin, is characteristic of the West Greek masters. There are, however, cruder works as well, such as the head of a kouros in Agrigento, which is obviously related to the Greek kouroi of about 520, for example, in its imitation of the large ringlets over the forehead. More masklike, and in this comparable to the earliest Selinuntine metopes, is a head from Selinunte (Palermo, Mus. Naz. Arch.). On the whole, it seems as if the large terra-cotta figures and heads, for which there were evidently no imported Greek prototypes, represent the indigenous western Greek style most forcefully. This native impulse finds expression above all in the heads from Selinunte, Agrigento, Megara, and Locri.

The kore type naturally played an important role in the terra-cotta sculpture of Magna Graecia and Sicily. The East Greek type of unguentarium underwent in Gela an interesting change owing to a style of drapery — a gathering up of the garment — that became fashionable about 550, and owing also to the circumstance that the korai bore on their heads a round container, probably for the oil that was to be poured on the grave. About 520 the East Greek type of kore was supplanted by another, basically related to the type common in Chios. The kore was particularly susceptible of variation, and it was modified in the individual cities in accordance with the predominance of Ionians or Dorians. In Syracuse and its environs more linear, pillar-shaped types appeared. In Gela and Akragas the figures were fuller, modeled with greater softness; there was an interesting tendency to render the folds of the skirt as an ornamental pattern. The terra cottas of Lokroi, Kaulonia, and Medma took a direction of their own, seen in the vigorous linearity of their forms and the preservation, well into the 5th century, of these archaic types. In the period of the severe style, the Ionian element seems everywhere to dominate terra-cotta sculpture. This is shown not only by the mass importation into Gela and areas under her influence of peplos figures, such as those made chiefly in Rhodes, but also by the appearance in the neighborhood of Syracuse (Grammichele) of peplos figures that follow the eastern type, with the peplos softly billowing around the body.

Among the most important of the West Greek reliefs is the one from Gela with the bust of a youth, the oval edge of which indicates that it rested on a funerary stele; this relief, in Syracuse, represents a West Greek type nonexistent in Greece, which reappears in the late Hellenistic clay steles from Calvi (A. Levi, *Le terracotte figurate del Museo Nazionale di Napoli*, Florence, 1926, pl. 8). The features have a certain affinity with the heads in the "Ludovisi Throne" but, as is often the case in Italiote faces, the lips are more accentuated. The stylization of the curling locks of hair, spread fanwise on the nape, conforms fully to the stylistic taste of the Hellenic west.

After the middle of the 5th century, terra-cotta sculpture undoubtedly made the greatest contribution to the formation of a western Greek style. It even seems as if in this sculpture, which was manufactured in such large quantity, local styles can be distinguished, particularly for the large centers such as Taras, Lokroi, Syracuse, Gela-Akragas, and Selinous. While the statuettes of enthroned goddesses (PL. 74), like the religious images, adhered to a tectonic-hieratic style, the heads of heroes and heroines, especially the bearded and beardless heroes from Taras, show a full measure of the West Greek interest in movement and change. The finest of these heads seem to have been modeled by hand. In any case the curls of the beard and hair were loosely applied in clay, and the modeling marks in hair and eyes reveal the meticulousness of the carving of the faces. These splendid heads from Taras, with the curve of the neck suggesting the forceful motion of the body, are further differentiated from contemporary Greek works by the realism of the features — the forehead furrowed with lines and the eyes thoughtful. A still more definite imprint is in the faces of terra cottas from Medma and Naxos (Reggio Calabria, Mus. Naz.), some of which are suffused with melancholy; these heads display the tendency, peculiar to West Greek art, toward individual characterization and the expression of a particular mood. In another large group of heads in the same museum, chiefly of goddesses, the artist's efforts were directed toward endowing the subject with a supernatural beauty. Two heads in Taranto, unquestionably images of goddesses, indicate the intensity of movement that must have animated the bodies. The careful rendering of the diadems, which are similar to one found in Cipriano, leads us to think that we are dealing here with terra-cotta copies of a famous Tarentine cult image. Presumably the votive busts of goddesses wearing the polos (PL. 74) are related to these heads of divinities; they, too, probably reproduce some famous cult image representing the great earth and fertility goddess Persephone. The bloom of the features and the wavy hair make these heads comparable to the most beautiful Syracusan coins of the last decades before the fall of Akragas. Here, too, Greek and Siculan elements are present in varying degrees.

The lavishness of the way in which funerary ritual was developing, known to us mainly through the finds in Taranto,

led to the formation of completely new types, mostly works executed in relief and without a background, the sharp outlines giving the illusion of three dimensions. The basis for these was the fertile imagination of the western Greeks, which, making full use of the wealth of eschatological concepts, arrived at fantastic motifs and combinations. Thus we see the deceased riding to the next world mounted on a sea horse, on a centaur, on a hybrid monster, or on some fabulous beast. In addition to the type showing the journey to the next world, there is a type incorporating the Ionian idea of the funeral banquet; this had an especially wide circulation in Taras, beginning late in the 6th century but not reaching its peak till the end of the 5th century. The heroized dead rests on a couch (*kline*), before him a table bearing food and drink; sometimes a female figure playing a harp sits at the foot of the couch. It is not yet clear whether these reliefs were votive offerings to heroes or to the dead. Many of them, made from molds, were carefully retouched, and all were once brightly polychromed. What is characteristically West Greek is the overrefinement of the forms, particularly the profiles, and the rather abrupt twist of the torsos of the youths. But it is precisely in this conscious deviation from anatomical accuracy that the delicate charm of these images lies. After these almost budlike creations of the late 5th century, the forms of the later reliefs grow more sumptuous: they are, so to speak, in full bloom. But all are characterized — at least so far as the artistic intention is concerned — by a heightening of the "beauty" of the human face.

The votive pinakes from Locri (PL. 75) illustrate myths that, although clearly woven round the great goddesses Demeter and Kore, remain obscure as to their details, in the absence of a written tradition. But here again it is the poetic invention that makes many of these reliefs unique, for example, the scene of Persephone's companions gathering pomegranates (Reggio Calabria, Mus. Naz.). Like all the works executed in the Locri area, these are remarkable for the linearity of the forms. For some unknown reason the custom of dedicating such pinakes was limited to the period 470–450. Whether the relief pinakes were a passing fashion or were produced by specific workshops that then went out of existence, or whether it is simply that finds from later per ods have not yet been made, has not been established.

As in Greece proper, there was a change in the funeral rites near the middle of the 4th century, in southern Italy as well as in Sicily. Instead of the usual terra-cotta images of the great goddesses, graceful figures of maidens were placed beside the deceased. It does not explain this to say that the magnificent tectonic austerity of the earlier figures of enthroned goddesses — known chiefly through examples from Locri, Taranto, and Agrigento — was supplanted by a somewhat too exuberant fashion of modeling, with an occasional appearance of the pathetic, for the later goddesses are marked by the expression of the pathetic and show the full-blown forms of the 4th century. One is reminded of tomb figurines of the Muses accompanying the dead to the afterworld. Sometimes these figures carry a kidskin or a tympanon, in which case it seems more likely that they represent maenads of the Dionysian thiasos; at other times, when they are veiled and dance the *baukismos*, they may be related to the cult of Adonis and Aphrodite. The significance of these beautiful, if overelegant, female figurines was probably no longer known by the end of the 3d century; the earliest are clearly related to the Tanagra figurines. The type spread to Alexandria and northern Greece and, especially in the west, was eagerly taken up and widely circulated. The figurines were continually recast and adapted to local taste through slight variations in pose, attributes, and hair style; the most graceful belong to the 3d century (PL. 78). The vogue reached a peak with the figures in truly rococo attitudes, holding high the *lampadion*, of the period about 200 — as is shown chiefly by the examples from Taranto. With the Roman occupation (209 B.C.), the imagination and refinement of this terra-cotta sculpture seem gradually to have died out; as in the Greek east, in the early 2d century the size of the figures increased, and the poverty of imagination was compensated for by a wealth of movement, of gesture, and of pathos. Comparison with the 3d-century terra cottas shows an unmistakable falling off. At the beginning of the 2d century, more and more figures of winged youths, presumably Erotes, appear. There also appear small gladiators and grotesque figures with wreaths of flowers round their necks, plainly meant to amuse the deceased in the afterworld. This profanation of the afterworld bears testimony to the rapid cultural decline of Taras in the 2d century. Along with these developments there was a clear classicistic trend, a return to earlier types, and an attempt to give terra cottas once more a greater coherence of expression.

The types created in Taras were widely distributed, to some extent in Sicily but mainly in Apulia; indeed, it seems that after the Roman occupation there was a marked Hellenization of Apulia. The influx of Tarentine terra cottas is shown by the finds in Egnazia (anc. Gnathia), Lecce, Canosa, and even in the provincial Campanian cities. If the simple fact of exportation does not account for the appearance of these types resembling the Tanagra figurines, a northward emigration of Tarentine artists is conceivable. It must be remembered that, especially in Etruria, the terra-cotta figures of earlier periods, particularly the heads, in many cases recall the terra cottas of Magna Graecia — most of all, of Taras. Without the influence of Tarentine terra cottas, the early-5th- and 3d-century statuettes from Falerii (mod. Civita Castellana) are unthinkable. The intensification of trade in southern Italy and Sicily as a result of the Roman occupation could also have accelerated an artistic and cultural exchange, whether through traveling artists or through the exportation of matrices and copies of terra cottas. The antefixes found at Fratte, near Salerno, are interesting in this connection; they bear the Tarentine stamp, if in a slightly Italic reworking.

The Tarentine female figurines in clay appear in an entirely new application as decoration on the large terra-cotta askoi that were produced chiefly in Canosa (PL. 78) and Ruvo. The expressiveness of the Canosan terra-cotta sculpture is heightened by the lengthening of the figures, the pathos of the features, and, above all, by the red and blue coloring of individual parts, following the late-2d-century fashion in Sicily, Italy, and Greece.

The terra-cotta busts found in large numbers in Lucera (PL. 78) probably also originated in Taras. Some of these probably belonged to statues. The beginning of this local production can be placed in the early 4th century, but not until the 2d, perhaps even the 1st, did this art develop its own individuality. In some of these busts, there is a blending of the late Hellenistic character of Tarentine models with elements associated with republican Rome. In others occurs a loosening, almost a dissolution, of forms that recalls the Celtic-Italic terra cottas of the Po Valley.

Unfortunately, it is not so easy to form a picture of the no less important terra-cotta sculpture of Sicily. Most of the terra cottas seem to have been destroyed in antiquity as the large cities, particularly Syracuse and Katana, grew up. It is also possible that the burial rites in Sicily in this epoch did not require so great a number of terra-cotta figures. The few brought to light in Syracuse and Agrigento are related to the types already known from Taranto, although with less of the baroque. Only in Centuripe (anc. Kentoripa) have any considerable number been preserved. During the late Hellenistic period the development of this city was marked by an unexpected upswing, but it declined just as rapidly; hence its burials have been preserved till the 20th century. The earliest of the terra cottas that they have yielded are related to the 4th-century busts from Agrigento; most of them, however, can be no earlier than the 2d or 1st century. Generally they are late Tanagraean types. As in Taras, so in Kentoripa the figures increased in size during the 2d century. Particularly favored was the Seilenos with hide kilts, not found, it seems, in contemporary Tarentine sculpture. Soloeis (mod. Solunto) was also an important center of production; this city seems to have had its first period of prosperity in the second half of the 2d century B.C. Most of the terra cottas found here show elongated figures in violent motion, but not outright baroque forms; the impression of powerful movement is obtained chiefly through the stance, in which the free leg of the *contrapposto* is far to the side. Many

charming figures have survived from the period at the end of the 2d century during which the western Greek cities developed rapidly under Roman rule. In their classicism, however, they go back to types of the 4th and the early 3d centuries.

Highly characteristic of West Greek art are the clay altars that have been found in graves, mainly of Lokroi, Kaulonia, Taras, Kentoripa, and Selinous. Most of them seem to date from the second half of the 6th century. They should probably be understood as connected with ritual practices peculiar to the western Greeks: the type did not exist in the motherland in the 6th century, though it will be recalled that in the 4th and 3d centuries in central Greece, especially Boeotia, Locris, and Thessaly, small and modest altars were put into the graves with the deceased. This custom was very widespread in Magna Graecia and Sicily. Some of the West Greek altars were as much as $15\,^3/_4$ in. wide. It is not known whether they were always put into the grave or whether in some cases they were placed on top of the grave.

For the most part from $3\,^7/_8$ to $7\,^7/_8$ in. wide, the clay altars are virtually always decorated, on the front only, with relief figures. The earliest one that has been preserved has a frontal representation of a quadriga comparable in some respects to those on the Selinuntine metopes. They are decorated primarily with the fighting animals that were part of the symbolism for the great divinities of the underworld, and sometimes with heraldic sphinxes alongside double volutes. One of the most beautiful of the altars, found in Centuripe, has fighting animals in the mature style of the late 6th century. Mythical scenes, such as Herakles fighting with the Old Man of the Sea, are also numerous, as are bacchic scenes with maenads and Seilenoi.

While clay altars seem generally to have gone out of use in the early 5th century, they continued to be popular in the Taras of the early 4th century. Among the most frequently represented themes is a bride sitting on a bed, probably to be understood not as a bride in life but as a bride of death. Other subjects include Aphrodite in a little skiff pulled over the waves by Eros and Psyche. The number of clay altars increased again in the late 3d and the 2d century, but the decorative motifs were limited to playing Erotes and heads of gods emerging from vines.

The Tarentine terra cottas with openwork reliefs that were once brightly gilded constitute a special group (Wuilleumier, 1939, pl. LX, 5, 6). Like the Melian reliefs, they probably served to decorate wooden sarcophagi. These too were in vogue for only a short time. It is indicative of the influence of Tarentine art, however, that related types, though in gesso and of poorer quality, were found as far away as the Crimea. Again, these south Russian reliefs seem to have been in use only in the short period from 320 to 280. Since it is to chance or to grave robbing that we owe most of the Tarentine gold reliefs, no remains of the wood of the sarcophagi have ever been discovered. But there can be no doubt that the friezes on the sarcophagi were composed of these reliefs. Nereids on dolphins are favorite themes. Other mythological subjects are represented that probably had an eschatological significance which is not yet understood. A greater number of these reliefs will have to be accumulated before the many problems concerning them can be solved.

*Bronze sculpture.* Not much has been preserved of the bronze sculpture of Magna Graecia and Sicily which figures so largely in the written tradition. For this reason, and because the trade in bronzes must have been as intense as that in terra cottas, it is difficult to identify the various schools and workshops. Bronzes may have been imported in very early times. Late Geometric bronze horses have been found in Taranto and Syracuse, in tombs dated about 700. Without question the late Daedalic kore in Boston (Mus. of Fine Arts), which is closely related to the head from Laianello in Syracuse and, like it, probably from the late 7th century, is a Syracusan work. There are a greater number of 6th-century works; in fact, many of the really ancient-looking images are actually not so early as they seem. Definitely from the middle of the 6th century is the running winged figure in the British Museum (Jantzen, 1937, pl. 12, no. 46), the head of which is strongly linked to Spartan works; this must be a Tarentine product. The horseman from Grumentum (Br. Mus., 1904, 7–3.1), whose head is reminiscent of Chalcidian vase figures, may also belong to the middle of the century. The sphinxes and Gorgons (Jantzen, 1937, pls. 32, 33), found chiefly in the Syracusan trading area, are later and are related to Corinthian figures. They were probably part of a larger complex, perhaps a tripod similar to those found in Metaponto. The important bronze mask from Taranto probably belongs to the same period (Wuilleumier, 1939, pl. xv, 4); the features unfortunately have been too much "beautified" by a restorer. The fine solid-cast figure found in Locri, and evidently made there, is related to Ionian bronzes, perhaps from Samos; special interest attaches to it because a similar terra-cotta figure has been found in the Forum in Rome. This type continued to exist in Etruria as well.

The most significant of the early 5th-century Sicilian bronzes is the *Ephebus* of Selinunte (PL. 71; stolen, 1962), certainly a locally worked piece. Whether this represents a god or is a votive statue of a youth is still to be resolved; the outstretched right hand may have held a bowl, the left a branch or bow. The figure is of a rather high artistic level and thus exemplifies the West Greek style with particular clarity. The bearing differs from that of Greek figures of the mother country, in that it shows more of a turn toward the right and a less organic realization of the body. The asymmetry of the head is so pronounced that its beauty is fully revealed only if it is seen from the proper point of view; its proportions, with the powerful chin and short nose, mark this as a creation of the severe style. The eye inlay, still in place, lends an intensity to the expression that was further enhanced by the eyebrows, once inlaid with copper. The forehead is accentuated by the strands of hair curled round a bronze headband.

A specialty of the bronze workshops of the western Greeks were the figures of youths that served to support circular mirrors; in Greece proper the figures of maidens were generally used for this purpose. It is surely not by chance that these stands are in the form of male figures: the mirrors may not have been destined for daily use by beautiful women but may have had, as has already been conjectured, an eschatalogical significance. Here, as frequently in West Greek art, we may be dealing with a survival of primordial custom. The nude youth in New York (Met. Mus.) with two horses rearing from his shoulders and a female torso emerging from his head is certainly not just a play of fancy: the goddess emerging from the head of a youth is a type known from a related bronze, probably also from south Italy, in Vienna (Kunsthist. Mus.), and from the Cycladic idols of the 2d millennium B.C. Whether this particular bronze was also a mirror stand has not yet been established; several other figures apparently stemming from various workshops definitely were. The youth in Boston (Mus. of Fine Arts) with his hand on his hip bears a strong resemblance in facial features to certain small heads from Medma. The boxers in the British Museum and in Vibo Valentia (Coll. Capialbi) show the influence of the workshop of Pythagoras. Chronologically the last of this kind is the somewhat soft youth with elaborate hair style and an Ionic capital on his head, also in Vibo. One could interpret him as Adonis and thus supply a presumptive explanation of all these mirror stands in the form of male figures. Female figures serving this function are far less numerous: the one in the British Museum, wearing an Ionic chiton, can, because of its linearity, be considered Locrian, as can also the young woman with the ball in Reggio Calabria (PL. 73) and another in Copenhagen (Nationalmuseet). The one in the Kaufmann Collection (Copenhagen, Nationalmuseet), which is very close to Argive figures, is perhaps Tarentine. Both the form of the head and the flower blossoming out of the skull to support the mirror are characteristic of Magna Graecia; an additional indication is the triangular base, a feature not usual in the mother country.

Mirrors with a round handle of wood or ivory in place of the human-figure stand were often developed into works of great beauty in Lokroi; related to early-5th-century Ionic examples, these did not appear until the middle of the century.

The earliest, with a heraldic siren, shows the Locrian stamp with especial distinctness in the calligraphic treatment of the volutes and palmettes unfolding from the haft and in the heraldic aspect of the great wings of the sphinx. Openwork mirrors are common, at times flanked by Ionic columns, representing Aphrodite and Eros (PL. 79) or other divinities.

A type particularly widespread in south Italy is the figure of a youth holding in his hands a shallow bowl, probably for libations. The figure was designed not to stand but to be held horizontally: the offerer grasped the youth's body and poured out the libation. The particular ritual for which these were used, unknown to us, was also widely practiced in Greece proper. This type, whose earliest examples may go back to the last years of the 6th century, very soon assumed rigidly hieratic forms, apparently for ritual reasons. Still, the pose both of the human figures and of the animals held in their arms leads one to conclude that the greater part of them belong to the severe style and that they did not succumb to this rigidity until the late 5th century. Likewise a creation of the south Italian imagination are the figures of youths placed symmetrically at either side of a bronze bowl, bending forward to support the large handles with their hands. The type, which could be Tarentine, includes some of the most perfect examples of nude figures of youths surviving from mid-5th-century Magna Graecia. To this group belong the nude figures, such as the early-4th-century Herakles in London (Br. Mus.), which served as handles for large vases. From Magna Graecia this type no doubt passed to the Etruscans.

The number of votive figures that survived to modern times is not large. One of the most important is the bronze of a youth (whereabouts unknown) whose head reminds one of the kithara player of Pompeii. Two peplos figures, a warlike *Athena* in Naples (Mus. Naz.) and a standing one in London (Br. Mus.), could be Tarentine works in the severe style, as is the magnificent *Orpheus* in The Hermitage, Leningrad. In the last work, the West Greek artist's sense of space is apparent in the way in which Orpheus, playing his lyre, sits on the rock with one knee drawn up high, as well as in the movement of the deep and soft-falling folds of his garment. The same stylistic tendencies, somewhat coarsened, are met with in the weary *Odysseus* in Minorca, unquestionably West Greek, even if executed in Iberian territory. The reclining youth of Este (Mus. Naz. Atestino), which is related to the best of the early Tarentine limestone reliefs, marks the passing of this fine sculpture. Mention has already been made of the workshop that produced the athlete from Adrano (PL. 70), which suggests the influence of Pythagoras, as does the ax-brandishing figure in Washington, D.C. (PL. 70). The transition to the bronze sculpture of central Italy is represented by the bow-stretching *Apollo* from Bari, which is probably early-5th-century (*Iapigia*, I, 1930, p. 366, pl. 1). The *Dioskouroi* in Naples (Mus. Naz.), Lysippian in style, could belong to the artistic circle of Taras; a West Greek origin is suggested by the massiveness of the torsos. The *Hermes* from Lucania (formerly called Basilicata) in the British Museum (*RM*, XLVI, 1931, p. 130 ff.) could also have belonged to the Taras circle. The last important bronze work of which we have even a vague idea is a Nike of Taras, transported to Rome in 209 and reproduced there in terra cottas and in numerous coins of the Imperial age.

ARTISTS AND BIBLIOG. (*Sculptors*). Daidalos (Δαίδαλος; see GREEK ART, AEGEAN). – Klearchos (Κλέαρχος) of Rhegion, by some said to be a follower of Dipoinos and Skyllis or of Daidalos, by others mentioned as a pupil of Eucheiros of Corinth and as master of Pythagoras, unless merely a similarity of names is involved: bronze statue of Zeus Hypatos in Temple of Athena Chalkioikos in Sparta (M. Bieber, ThB, s.v.; Lippold, GP, pp. 33, 92). – Perillos (Πέριλλος), or Perilaos (Περίλαος), bronzeworker, perhaps from Akragas: bronze bull for the tyrant Phalaris (570–555 B.C.), an instrument of torture (ThB, s.v.; Lippold, GP, p. 49). – Simmias (Σιμμίας), son of Eupalamos of Athens, archaic period: statue of Dionysos Morychos in Athens or Sicily (Lippold, GP, p. 91). – Krates (Κράτης), 6th cent., named in a boustrophedon inscription from the tomb of a certain Pasiades, near Terranova in Sicily (M. Bieber, ThB, s.v.). – Polystratos (Πολύστρατος) of Ambrakia, active ca. mid-6th cent.: perhaps statue of Phalaris in Akragas (lost; G. Lippold, RE, s.v.). – Patrokles (Πατροκλῆς), son of Katillos of Kroton, perhaps archaic period: statue of Apollo in Olympia (where it still existed at the time of Pausanias), in wood with gilded head, gift of the inhabitants of Lokroi hoi Epizephyrioi (G. Lippold, RE, s.v.; Lippold, GP, p. 92). – Damemeas (Δαμέας), bronzeworker of Kroton, second half of 6th cent.: statue of the wrestler Milon in Olympia, after 532 (L. Guerrini, EAA, s.v., I). – Damophilos (Δαμόφιλος) and Gorgasos (Τοργασος), terra-cotta sculptors and painters, Sicilian or from Magna Graecia, active in Rome: terra-cotta statues and paintings in Temple of Ceres in Rome, consecrated 490 B.C. (Lippold, GP, p. 91; B. Pace, L. Guerrini, EAA, s.v.). – Pythagoras (Πυθαγόρας), bronzeworker of Rhegion or (according to an inscription) of Samos, considered the follower of Klearchos of Rhegion, active 480–448 B.C.: (1) in Olympia: Astylos of Kroton; Euthymos of Lokroi, Mnaseas of Cyrene; Leontiskos of Messana; Kratisthenes, son of Mnaseas; runner; boxer; statue of a "nude with apples"; (2) in Syracuse: *Claudicans*, perhaps Philoktetes; (3) probably in Kroton: Apollo transfixing the serpent with his arrows, reproduced on coins of the city; (4) in Thebes: Eteokles and Polyneikes slaying each other; statue of the lyre player Cleone; seven nude statues and an old man (defenders of Thebes, Tiresias); (5) in Taras: Europa on the Bull; (6) in Delphi: pancratian Perseus (E. Langlotz, Die Antike, VI, 1930, p. 1 ff.; Picard, II, 2, pp. 111–24, 663–64; M. Bieber, ThB, s.v.; Lippold, GP, p. 124 ff.; S. Stucchi, BCom, LXXV, 1956, pp. 3–47; A. de Franciscis, Klearchos, 5–6, 1960, pp. 5–56). – Sostratos (Σώστρατος) of Rhegion, nephew and assistant of Pythagoras (M. Bieber, ThB, s.v., II; Lippold, GP, p. 176). – Akron (Ἄκρων) of Selinous, son of Praton, active at end of 5th cent.: in Delphi, signed base with mutilated inscription for two statues (lost), perhaps Asklepios and Hygieia (L. Guerrini, EAA, s.v.). – Silanion (Σιλανίων), bronzeworker, placed by Pliny in the Olympiad 113 (328–325) but perhaps active 370–320 B.C.: statue of Sappho in the Prytaneion at Syracuse (see ATTIC AND BOEOTIAN ART). – Lysippos (q.v.).

METALWORK. The production of bronze vessels seems to have been greater in Magna Graecia than in Greece proper, perhaps because of the comparative abundance of minerals in Italy and Sardinia. The influence of metalwork of Magna Graecia on the production of Etruria may also be due to the fact that finished vessels were exchanged for the ore of Etruscan mines. Only two centers of production are known with any certainty: Taras and Rhegion or its surroundings.

No particularly important bronze vessels of the 6th and 5th centuries B.C. from Taras have been found; however, it is very likely that the so-called "Laconian" hydrias, which unquestionably originated in Sparta, were also made here. As with the marble and clay sculpture, it is not always easy to separate the Greek from the Magna Graecian elements; still, a hydria from Randazzo similar to the Laconian type, for example, is distinguished from true Laconian work by the softened decoration of the handles. The same distinction is true of the lion hydria from Paestum, not only in the lion bodies that serve as handles but also in the two horse protomas replacing the usual handle mounts on the horizontal handles. Both the use of these animal ornaments and their style is without precedent in Greece proper. These hydrias were very likely made in Magna Graecia, perhaps in Taras. Furthermore, the use of the lion bodies suggests that the magnificent bronze crater from Vix (I, PL. 354) was made in Taras rather than in Sparta. Its exceptional height of 5 ft., 4 1/2 in. and weight of nearly 460 lb. might alone qualify this as the most impressive bronze vase of antiquity. This sturdy container rises from a wide gadrooned foot, with a frieze of applied relief on the neck, showing warriors on foot and in four-horse chariots, and volute handles ornamented with a serpent-tailed Gorgon. Under the volutes stand lions with heads turned menacingly, which recall those on the Paestum hydria. The delicate modeling and broad surfaces of the female figure standing on the sieve also suggest that this crater originated in Taras. While her features are pure Spartan, her soft and elegant figure differs markedly from the statuettes found in Sparta. The mere finding of such bronze craters, called "Laconian" in antiquity, in northern Greece and even in Russia does not constitute an argument against Tarentine origin, since in other works the influence of Magna Graecian art, probably by way of the great ancient trade routes, such as the Egnatian Way, has been ascertained

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

in the north Balkan area and south Russia. The Laconian crater was the preferred form in Apulia, both in bronze and the more frequently used terra cotta. Although the form is also found in the mother country, the fact that the best Attic terra-cotta vases of this kind were found in Italy cannot fail to be remarked; and they were certainly made in this style in accordance with the prevailing Italic taste. One particularly elaborate vase (ca. 400 B.C.) in Boston has preserved the rich bronze pedestal that all the vases, both clay and bronze, very likely had. Strangely enough, similar vases — though less fine — were found in Pompeii; perhaps during the early 1st century B.C., in the retrospective atmosphere of the Pasitelean age, vases of this type were simply reproduced in great numbers.

The preeminent bronze workshops of Taras seem to have had somewhat provincial successors. The hydria typical of Nîmes can be explained in type and style only as a derivation from Tarentine work, and the same interpretation holds for a class of hydrias in which the junctures of the side handles had the shape of hands, as in finds from Naples and Paestum. More characteristic of the Italic taste, probably Campanian, is a splendid hydria with a gorgoneion in Naples (PL. 73). The Gorgon, her hair flying, has arms that emerge in nonorganic fashion from her head. The protomas of two horses galloping over her head and the nude youths sitting on the side handles, decorated with palmettes, testify to the rich invention of the West Greek metalworkers. Bronze amphoras from Gela and Monte Casale, works now in Syracuse, are perhaps attributable to the sphere of influence of one of the colonies along the Messana route. Their type does not seem to have existed in Greece but does recall the Northampton amphoras. To the same school, perhaps located in Rhegion, can probably be assigned the magnificent bronze paterae decorated with small buttons, whose handles are sometimes very imaginatively treated, such as those with youths supporting the haft. This form of patera remained common until Roman times in Pompeii, with some even displaying suggestions of earlier types, particularly in the hafts with sirens. These works may have been created by the circle of Pasiteles, which executed works of this kind early in the 1st century B.C. and took inspiration from the best older models. Unfortunately, there are no detailed descriptions of the Tarentine candelabra, which according to literary traditions cost as much as 50,000 sesterces. A tripod (Berlin) found at Metaponto, like one from Speyer and another from La Garenne, could be a product of central Italy, although it is strongly influenced by typical Magna Graecian forms.

The bond between these bronze vessels and those of northern Greece and southern Russia is obvious. Nevertheless, the hypothesis of Züchner (*Wpr*, 98, 1938) — that these fine works all come from East Greek regions — is probably just as erroneous as the supposition that all vases of this type found in the Balkans and southern Russia are Tarentine, for it is impossible to establish from which side the greater contribution came. But it should be pointed out that, notwithstanding clear relationships, the examples found in northern Greece and southern Russia are somewhat different stylistically from those found in Taranto. No Greek city or workshop had a monopoly, and imitations adapted to local taste were produced everywhere. Later, most bronze pails of the Tarentine type were apparently made in Campania as well and even in the Celtic sections of northern Italy and Gaul. The barbarizing of the typical Tarentine decoration is particularly evident in a pail from Waldalgesheim.

The precious vases from Taras give us an idea of the luxury and wealth of the city. Livy (xxvii, 16, 7) relates that the Romans, when they occupied Taras in 209 B.C., seized 3,080 pounds of gold. Although there must also have been substantial gold- and silverwork in Sicilian cities, above all in Syracuse and Katana, very little has come to light beyond the Taras site. Some objects have been found in Himera and Catania, but all these are strongly redolent of Tarentine work. The fine pieces found in Italy, for example, at Ancona and Civita Castellana, all seem to be Tarentine in origin. The upswing in this metal production does not seem to have taken place until the 4th century, when prosperity and luxury were widespread, particularly in Taras. In the Greek world, silver objects from that century are found only in Thrace, around the Propontis, and in the Crimea, while the economic expansion associated with early Hellenism seems to have stimulated the rapid development of metalwork, especially in Alexandria. It might be maintained that the period between 320 and 230 B.C. was the classic period of metalwork. The extensive economic and commercial contacts between Taras and other important metalworking centers, along with the fact that the clay or stucco models used by metalworkers could be transported readily, produced close stylistic ties in 4th-century metalwork between that city and northern Greece and the Pontic littoral. From the 3d century B.C. on, this economic and stylistic interplay included Alexandria and perhaps Syria.

It is difficult to ascertain whether the silverwork found in southern Italy originated in Magna Graecia or was imported from northern Greece; a combination of both sources is most probable. But, in view of its poverty, the Greek homeland of the 4th century B.C. could hardly have been an important center. Northern Greece and the territories along the Pontos, which — like the Orient with which they were continually in touch — preferred votive offerings in precious metals, were given strong artistic impetus by the economic expansion during Alexander's reign. Unquestionably, the toreutic work of southern Italy evidences marked stylistic similarity to that of Thrace; however, more thorough study of the forms reveals the Thracian gold and silver objects as usually inferior to those of Taras and the territories along the Pontos that were under the influence of East Greek centers. The origin of a silver rhyton bearing a "hieros gamos" scene (Wuilleumier, 1939, pl. XVIII, 2) found at Taranto remains uncertain. In addition to its similarities to Tarentine works, other qualities relate it to Thrace, so that it may very well be the work of a Thracian artist who emigrated to Taras about 400 B.C. A silver bowl formerly in Bari, and since unfortunately lost, was undoubtedly Tarentine work and must have been created in the first half of the 3d century. One of the most elegant toreutic works of antiquity, it was unquestionably from the hand of a great master. In the middle of the bowl were two lovers, the hero turning to speak with a heroine who irresolutely looked off into space and gracefully gathered up her garment. The attitude of the two figures leaning toward each other, the way in which different states of mind, bearing, and gestures were presented, and the great harmony of the whole have been equaled only in the finest Attic cups from about 500 B.C. Surrounding this scene the artist placed masks, mainly of the New Comedy; in low relief on the outside were heads of griffins and Persian lions, and at the bottom was a finely drawn, star-shaped design of palmettes and acanthus that revealed a decorative sense unrecognized in the art of the mother country but destined to exert great influence in Roman sculpture. The purely ornamental forms of a thurible in the Rothschild Collection are stronger: its frieze of bucrania and the pine-cone form of the cover herald tendencies of Roman art. One of the finest of the Rothschild treasures is a kantharos whose extremely slender and elegant form excludes the early-3d-century date generally assigned but indicates a period of about 200 B.C. instead (*B. van de Vereeniging*, XXXIII, 1958, p. 51, fig. 14). Applied under its handles are putti supporting slender vases on their shoulders, figures that represent a type well known in the terra-cotta sculpture of Myrina about 200 B.C. Of particular beauty is the high-relief garland encircling the neck of the vessel, another ornament that did not develop fully until the onset of Italic Hellenism and in the art of the Imperial Roman epoch.

Belonging to the early 2d century B.C. is a silver pyxis that departs noticeably from the customary Greek form (Wuilleumier, 1939, pl. XX). In Greece proper there is no parallel for the squat, rather unharmonious form resting on three lion feet ornamented with sirens. The walls of the vessel are strongly curved outward; the bottom is decorated with a leaf rosette which may be related to Syrian models and which strongly influenced late Hellenistic Megarian and Calene cups. Figures in high relief adorn nearly the entire cover: in the middle a strongly foreshortened Zeus, scepter in hand, turns to Apollo; at the right, Artemis crowns Zeus with a wreath. This pyxis

is signed by Nikon. The flat dishes with Dionysian couples kissing may also be early 2d century; they recall some of the Gnathia plates. This type survived in Pompeian silver dishes into the Imperial age. A silver hoard from Canosa could perhaps have been executed under Tarentine influence, if not in Taras itself (Wuilleumier, 1939, pl. XXV). These finds stem from the city's golden age, about the middle of the 2d century. Undoubtedly Tarentine is a mirror with a seated half-nude girl, holding in her left hand a comic mask that seems to arouse the curiosity of a small Eros. Next to her is a stele, bound with taeniae, that may have supported the image of a god, while before her on the ground is a second small Eros blowing the syrinx. Nothing but the wings and the bottom half of the body remain of another Eros, dancing on an outcrop above. Delicate leaves and palmettes are scattered over the free surface. The spatial freedom evident in the relationship of the figures to their surrounding area and in the placement and arrangement of the three Erotes is quite characteristic of the late phase of Tarentine Hellenism (ca. 150 B.C.). An interesting fusion of Greek and Italic components is found in a pyxis decorated on both sides with reliefs and bearing the name of the owner or possibly of the creator: "Opakas Sabaleida." The name is that of a Hellenized Iapygian, and the forms also testify to Iapygian influence. One relief tondo shows a Nereid riding on a sea lion; the other, a back view of a Nereid on a sea monster. Both animals, in whose eyes small rubies are set, and the Nereids reveal numerous traces of gilding. Besides these treasures, the Canosa burial held a scepter with a spun-gold staff and two small Nike figures, as well as a gold necklace and an earring in the form of a grape leaf with a bunch of grapes.

Of the same origin as the masterly Tarentine bowl formerly in Bari are two slender oval plates, each with a dancing Nike. These are among the finest examples of early-3d-century metalwork extant, and a comparison with plaster models from Memphis demonstrates the superiority of this work. The use of these plates is not clear; they may have decorated a large cuirass, or perhaps a tropaion, for the dancing Nike gracefully bears the replica of a tropaion on her shoulders. A representation such as this was very likely possible only about the time of the short-lived triumph of the Tarentines before 275 B.C.

The Tarentine silverwork found in Ancona and Civita Castellana may have served to some extent as models for the late Hellenistic silver services in Pompeii and for works of the Imperial era. A silver bowl in Berthouville (Normandy), with the representation of a sleeping nude maenad, recalls a 2d-century terra cotta in Taranto so strongly that more than the simple relationship of motifs seems likely (E. Babelon, *Le Trésor d'argenterie de Berthouville*, Paris, 1916, pl. 15). Toreutic work was easier to copy in metal, for it could be molded and cast. This facility probably explains the pure Hellenistic quality of many drinking vessels from Pompeii, whose relief decoration must still be investigated to verify the sources. Nonetheless, many of the large late Hellenistic basins, volutes, and calyx-craters might well be marble copies made during the Imperial age from famous Tarentine or Alexandrian toreutic works.

CERAMICS. Examination of the vase finds from individual western cities discloses a surprising multiplicity of types and indicates an absolute freedom of trade throughout Magna Graecia and Sicily, above all during the 7th and 6th centuries B.C. As early as the 7th century, terra-cotta vessels, differing from other ceramic ware in that their decoration consists primarily of relief work, were apparently being imported and copied in the west. This type was apparently greatly favored at this early date, particularly in Akragas, Gela, and Syracuse, and gradually developed local variations. Most of the well-preserved relief pithoi probably are not prior to the late 6th century. Generally chariot races are represented, but there are also mythical scenes such as Aktaion with the stag. Production of these relief vessels, with their extremely delicate decoration and yellowish slip, seems to have halted in the late 5th century.

A second class of relief-decorated vessels were the so-called "gutti." Their precise use remains a mystery, although they may represent a continuation of the Mycenaean *Bügelkanne* type and thus might have been used to pour oil into lamps. Such gutti, which were distributed throughout the Greek world, commonly display reliefs that mirror important works of art of the late 5th and 4th centuries. This type was also popular in Italic centers, particularly in Apulia and Campania; but only the workshop of Cales has been thoroughly studied as yet. Calene relief vessels, for the most part gutti and omphalos bowls largely of the 4th and 3d centuries, provide a wealth of important sources that were conserved by the handiwork of these classicizing potters (R. Pagenstecher, "Die Calenische Reliefkeramik," *JdI*, VIII, 1909, nos. 112–13, 163–281).

These vessels are interesting as a group in that they illustrate the continuance of forms brought from the Greek mainland and decoration enriched in accordance with Magna Graecian tastes. Truly new and significant achievements occurred at the end of the 5th century and were particularly noteworthy in the rhytons (Naples, Mus. Naz., Cat. Terr., p. 79, figs. 65, 67). Some are so finely executed that they may have been taken directly from silver and bronze models or may even have been the clay models for metalworkers. Their reliefs show the sensitive figures in motion that are found on the best early Tarentine limestone reliefs. A relief crater from Ruvo (Naples, Mus. Naz., no. 21666) and a relief skyphos from Egnazia (Naples, Mus. Naz., no. 16183) are as fine in workmanship as the rhytons; these also seem to indicate a copying of Tarentine bronze or silver vessels.

In the 4th century, higher standards of living and a demand for luxury ware must have increased the production of such relief-ornamented vessels, for vase painting was then in decline. Particularly around Taranto and in Apulia, many vessels with round relief emblems have been found, and the best of them appear to have been gilded in imitation of more costly material. "Eggshell" was widely copied in clay in Apulia; fragments of one particularly fine example are preserved in Taranto. Found in Bitonto, these might be from a copy of another work by the master of the Tarentine bowl, although somewhat diluted in quality through multiple recopying. The round emblems, which favor erotic subjects, were used mostly on clay pyxides (examples in Naples, Lyons, Marseilles, Lecce, Bari). These tondo reliefs also adapt well to use on mirrors, as evidenced by an Etruscan mirror from Tarquinia (Corneto). Round relief emblems were sometimes applied under the vertical handles of hydrias and occasionally were also set on the vessel walls. The wide diffusion and popularity of these exquisite relief emblems, whose matrices were exported, is evident in their somewhat incongruous appearance on locally produced vessels of crude form.

There is a somewhat plump variety of amphoras that form an interesting group among relief vessels (examples in Bonn, Akademisches Kunstmus., and Paris, Cab. Méd.; see also *Gaz. Archéol.*, 1881–82, pl. 26, right). These apparently belong to the early 2d century and, like the vases from Alexandria, Canosa, and Centuripe, are covered with a white slip in the fashion of the times. On the belly of the amphoras are Dionysian figures (*Hesperia*, 1947, pl. 67). This type of relief vessel also appeared in Etruria, at times in a somewhat barbarized form.

A group of large bowls from Centuripe are of still another, completely different kind. Their exteriors are most often decorated with built-up wreaths and garlands of clay and at times with relief heads. These works are also probably of the 2d century, like the Canosan askoi, with Medusa heads and Erotes figures applied in relief. The decline in quality of these relief vessels is evident in a fragment depicting a battle on horseback (Met. Mus.).

Like the relief vessels, other ceramic works were imported and copied in Magna Graecia and Sicily, especially during the 7th and 6th centuries. Since even in remote Ischia Geometric vases were produced in the early 7th century, it is reasonable to suppose that they originated in Sicily and Taras as well. It has been shown that as early as the late 8th century a pottery imitating late Geometric vases, especially in the so-called *Flimmerstil* (see GEOMETRIC ART), existed in Syracuse. A similar phenomenon is evident in finds from Megara Hyblaia, Leontinoi, Lokroi, Rhegion, and Ischia. It is clear that this older pottery is related to that imported from the mother country,

but from its first appearance in the 7th century the qualities typical of West Greek taste began to emerge. The volume of the vases increased, their ornamentation became looser and their decoration richer. These characteristics are particularly apparent in a crater from Syracuse, of Chalcidian form and decorated with a horse. When this Syracusan imitation of Corinthian pottery is compared with that from Etruria, the richer forms and the livelier imagination of the former strike the eye. The Siculan imprint is very strongly present in the vases found in Gela. In this vicinity, Rhodian vases were imported and imitated, and the forms introduced from the mother country were further developed. As far as is known, the production of Leontinoi, Kaulonia, and Lokroi was more meager, and it seems almost as if the imitacions made there were not the work of Greek colonists but of natives who tried to work in the Greek style. Definitely Italiote are the Caeretan hydrias (I, PL. 362), apparently painted by Phokaians, whose forms and decorative scenes became widely influential in Etruria. It is not so easy to define the part played by Taras, perhaps because the city was closer than the others to the mother country, especially with Sparta in the 7th and 6th centuries, and consequently imported goods from all parts of the Greek world.

A great number of Attic black-figured vases have come to light in the west, where they may have been made largely by Attic potters. There is also a possibility that potters and painters made occasional trips to Italy, where they copied favorite vase forms for their Italic and West Greek clients, such as Apulian *trozzelle* (VI, PL. 105), amphoras with ribbon handles, and cups and bowls of bucchero. Understandably, they also adapted the decoration to West Greek taste. Representations such as the Danaïdes on a black-figured lekythos in Palermo are never found in the Greek homeland (C. H. E. Haspels, *Attic Black-figured Lekythoi*, Paris, 1936, pl. 19, 5). The large number of black-figured Corinthian column craters found in south Italy and Sicily, especially within the circle of Corinthian colonization and trade, leads to the assumption that they were made by Attic potters at the request of their West Greek clients, since in the black-figured pottery of Attica their incidence was limited.

Most of the "Chalcidian" vases might have been executed in southern Italy, or they may also have been made in the Chalkis of Euboea, although thus far not a single certain fragment with a Chalcidian design or painting has come to light among the numerous finds in Greece. The hypothesis that their main center of production was situated on the Messana route is supported by the fact that most of the more than 100 fragments known — and among these the finest, such as an unpublished one from Lokroi with a four-winged goddess — were found in the area encompassed by Lokroi, Rhegion, and Syracuse. This production center was probably situated in one of the cities where East Greek and Chalcidian elements mingled, such as the Chalcidian Zankle (later called Messana), colonized by the Samians. In addition to the Chalcidian type of miniature column crater, small pitchers are also numerous. Very likely in order to speed up production and lower the cost, the vessels were only halfway immersed in the slip. Occasionally the representations also differ from those predominant in the mother country: for example, a *paidotribes* with a whip before athletes would be unthinkable in Greece (A. Rumpf, *Chalkidische Vasen*, Berlin-Leipzig, 1928, pl. 11).

At the beginning of the 5th century this Chalcidian manufactory succumbed to Attic competition. Black-figured vases of typical Chalcidian form continued to be made in Chalcidian workshops, for instance, a Nolan amphora in the Petit Palais (*CVA*, Paris, Petit Palais, pl. 2). It may be, however, that these workshops also made red-figured vases in competition with the Attic ones. The Argos pitcher from Cumae (Naples, Mus. Naz.) differs appreciably, both in the form of the foot and the drawing of the figures, from the Attic style (*JdI*, XVIII, 1903, pl. 2). In vase painting, as in other artistic media, the typical West Greek taste did not crystallize until the mid-5th century. Studies by Beazley, Moone, and Trendall have resulted in identification of the most important red-figured ceramists of this period. These were Attic painters, whose early works were with good reason once considered Attic creations and who may have moved to southern Italy about 450 B.C., on the occasion of the founding of Thourioi, a period in which both coins and terra-cotta sculpture reveal strong Attic influence. The earliest West Greek vases hardly differ from Attic products in form, technique, painting, and the external aspect of the clay.

The Pisticci Painter (PL. 76) and the Dancing Girl Painter initially continued to work in a genuine Attic style. Modern critics have charged them with a lack of imagination, since they always represented scenes of pursuit of youths and young girls, Erotes and maidens — an appraisal that does not concede the fact that they naturally had to adapt themselves to the wishes of their Tarentine and Lucanian clients. These vases are all from tombs and consequently mirror the eschatological concepts of southern Italy. The general provenance of the vases of the Pisticci Painter leads to the belief that this prolific painter settled in Taras or in the vicinity. His preference for the bell crater can probably be attributed to the taste of his clients. The delicate S-shaped line of the soft contours he favored was evidently popular in Magna Graecia until well into the 4th century. An examination of the development of this painter between 450 and 430 shows that both the form of his vases and his designs gradually lost their Attic harmony. A calyx-crater of his late period (Taranto, Mus. Naz.) clearly demonstrates this change in structure and softening of outline. This latter tendency, characteristically Magna Graecian, is even more clearly noted in the works of the Amykos Painter and the Sisyphos Painter, particularly in the realistic reproductions of flaccid male nudes and in the small, realistic features of the female nudes. Above all, the melancholy and at times absurdly ugly faces of the seilenoi differ totally from the Greek models. A gloomy, diabolical expression, present also in the seilenos terra cottas from Sicilian Naxos, emphasizes the peculiarity of the drawing in the Greek west.

During the Peloponnesian War (431–404) western commercial relations with Athens weakened; consequently, the influx of Attic painters to south Italy also seems to have diminished. It was assuredly this circumstance which contributed to the development of local qualities in the painting of Magna Graecia. The cities between Taras and Rhegion that remained on the margin of the conflict developed economically as a result of the war, their progress mirrored in the rapid rise of craftsmanship. Subject matter changed profoundly in this period: Greek myth began to be represented and conceived in a new way by the Italiote artists, and the mythical scene became populated with figures of Pan and seilenoi, whose introduction is probably due to religious or eschatological concepts. The more magnificent figural decorations of the Tarentine vases fall into this period. From this time on, the Laconian volute crater became the favorite form of the Tarentines and the Apulians (PL. 77). In the first decades of the 4th century a highly idealistic, classicizing tendency coexisted with a strongly realistic one, exemplified in the works of the Dionysian Painter.

The Karneia Painter (III, PL. 376) combines formal splendor with an exuberance that at times verges on realism. The coloring is often too unvaried, the bearing at times a bit awkward or stiff. The profiles, with the straight nose nearly continuing the line of the forehead, are a characteristic south Italian element. The gently rounded chin and the overly large eyes differentiate his work from that of his Attic contemporaries. Comparison of his Dionysos crater with a certainly coeval Attic one of the Pronomos Painter underscores the slackened outline and absence of tectonic structure in the former. Still, these qualities do not in the least diminish the magnificence of the composition and the singularity of motifs such as that of the maenad falling prey to Dionysian ecstasy. Moreover, completely new motifs were introduced into ceramics by Tarentine vase painters, in particular the architectural motifs. A representation of Apollo becoming visible in the temple is unique (Wuilleumier, pl. XLVII, 1). Notable spatial effects are achieved by strong foreshortening that is almost in correct perspective. The Dolon Painter developed a style bordering on realistic parody, a vein that had been pursued in Greece from the late 5th century on. His masterwork, a crater depicting the capture of Dolon by

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Diomedes and Odysseus (PL. 76), presents a lively scene, set amid woods represented by means of tree trunks. This device, perhaps inspired by scenic design, could have been adopted only by a Magna Graecian artist. On this crater the taste for the grotesque is not limited to the faces but includes the bodies as well. Since in his second important work — Odysseus offering sacrifices at the entrance to Hades — the painter abstained from such crass characterization and sought to increase the pathetic quality both in the drawing and in the gestures, it is likely that the marked exaggeration of the Dolon scene reflects the *phlyax* farces.

The Sisyphos and Sarpedon Painters evidence another tendency. In their enrichment of the vase form through decoration and in the spatiality and opulence of their figures, they are precursors of the Apulian vase painting that flourished about the mid-4th century. Although interesting artistic personalities can also be discerned among these Apulian painters of the second half of the 4th century, the personal note in their draftsmanship is not so sharp as in the Tarentine painting of the first half of the century. Exaggerating the prevailing artistic taste, they developed the gigantic vases of Ruvo (almost 6 ft. high), which present a pictorial catalogue, yet to be read or interpreted, of mythological and historical themes. A prime example is a representation of the Persian court (III, PL. 381; A. Alföldi, *Late Classical Studies in Honor of A. M. Friend*, Princeton, 1955, p. 15). This tendency seems to have declined about 300 B.C., and thereafter the representations become conventional. Dissolution of this vase style and production was especially apparent in the occasional replacement of the drawing on the neck by a baroque relief. These so-called "Apulian" vases were produced not only in Ruvo and Apulia but were also imitated in Sicily, at Syracuse. Smaller related vases, chiefly amphoras and Corinthian column craters, also seem to have been made in provincial workshops of Salento or northern Apulia (*CVA*, Lecce, Group IV Dr, pl. 29).

The decline of vase painting in Magna Graecia continued, despite the production of the Apulian painters, which finally came to an end in the early 3d century. The crisis had led some artists to pursue new directions even before the middle of the 4th century. The interest in space, the taste for polychromy, and above all the search for interesting physiognomies led this group of painters more or less to abandon the red-figured style in favor of white or polychrome figures; the first artist to do so was the Konnakis Painter (Rumpf, *MZ*, pl. 45, 1). The nude old woman dancing that is represented on a Tarentine fragment is a masterwork of this painting style and provides an interesting glimpse of the cultural life of this wealthy city already in decline. In the figure of an actor who has just laid aside his tragic mask and stands at the edge of the stage while the public applauds, there is fully revealed the great art of the Konnakis Painter, a master who enlivens his work with highlights and models pictorially through color shading. More naturalistic is a surprising representation of the palace of a king as a setting for the reception of a foreign dignitary, where the similiarity to a theatrical scene is again evident (Rumpf, *MZ*, pl. 44, 1).

While these vase painters abandoned the older outline drawing and moved toward tonal painting, another group renounced figural representations. The emergence of the rich and beautiful production of Gnathia (PL. 76) is attributable to this renewed preference for pure ornament. Rejecting excessive elaboration of vase forms and figural representation, these artists were content with the simple shapes, chiefly pitchers, unguentaria, and bowls. The main ornamentation consisted of tendrils, in white and golden yellow, while figures (e.g., jugglers and Erotes) became rare and were apparently used in localities where taste was more provincial. This type of ceramic work, whose origins date from the early 4th century, is a Magna Graecian creation which has counterparts both in Campania and Sicily. It even seems to have stimulated an analogous production in the Greek mother country in the late 4th and 3d centuries, evidenced by the so-called "West Slope" ceramics found near the Acropolis in Athens and also by objects found in several burials in Anatolia.

The pottery of Lucania and Campania has not been sufficiently studied, and the mere sorting of the various hands distinguishable, artistically rather mediocre, does not lead to any systematic knowledge of characteristic differences among these regional workshops. From an over-all view, it seems that the exchange with the mother country was less fertile here than in Taras. The birth of Campanian painting was perhaps related to the arrival of Attic painters, who set up workshops and eventually fostered the productive Campanian and Lucanian schools of vase painting. The Saticula Painter, most likely an Attic artist who emigrated early in the 4th century, readily adapted himself to the wishes and taste of the Campanians (A. Furtwängler and K. Reichhold, *Griechische Vasenmalerei*, ser. III, Munich, 1910–32, pl. 146).

The vases definitely inspired by the *phlyax* plays, the popular comic spectacles of southern Italy, are among the most important products of Magna Graecian vase art. In antiquity the phlyax vases were so admired that some artists, among them Assteas (PL. 76; III, PL. 417) and Lasimos, signed them. The burlesque costumes, with padded buttocks and exaggerated phalli that at times had to be knotted to keep the actors from treading on them, and the absurd masks, ugly yet full of character, occasionally inspired truly brilliant works. The phlyax vases, probably widespread in the 4th century, particularly in the vicinity of Paestum, unquestionably were also made in Taras, where they reached a high level of artistry. It may even be that the Dolon Painter was one of the originators of this vase type. Phlyax vases different from those of Paestum have been found in Lipari, Cefalù, and Gela; these finds suggest the existence of an independent Sicilian production of this kind (Rumpf, *MZ*, pl. 45, 2, 5).

The rich production of vases in the 7th and 6th centuries must surely have been succeeded by some autonomous vase painting in Sicily during the 5th century, but this has not yet been so thoroughly investigated as the south Italian. Undoubtedly, many vases at present considered Attic could be the work of Attic painters who emigrated to Sicily, such as the Painter of the Woolly Satyrs (or Silens). The scene on the vase from which his name is derived, a work from Gela, already differed from the Attic thiasos of the mid-5th century in the obscene and comic aspect of his seilenos figures. The representation on the other side, drawn by another hand, might well remove all doubt, for the assistant — certainly a pupil — who painted the cloaked youths was not Attic but Sicilian. Another figural crater (Palermo, Mus. Naz. Arch.), whose theme is a tired and mournful Herakles next to the dead lion, differs from Attic compositions in the head type, the modeling of the hair, and the over-all composition and could also be a Sicilian work of the mid-5th century (*JdI*, XLIX, 1934, p. 42, fig. 17). A pitcher in Randazzo (Coll. Vagliasindi), with the killing of the Harpies by the Boreades, dates from the end of the 5th century. The artist must have belonged to the circle of the Meidias Painter (q.v.), but the dramatic quality of the motifs is foreign to Greek taste, as are the strong foreshortening, the animation of the faces, and the curly hair. The details of a bell crater from Leontinoi, now in Syracuse, are different; to judge from the characteristic foot, present on black-ground vases as well, it might belong to an eastern Sicilian workshop. The crater is characteristic of the south Italian style in its softly rounded outlines, and the border around the mouth, decorated with a thick olive branch, purposely contrasts with the slender handles. The wavy decoration under the figures, used so extensively in later south Italian vase painting, probably appears here for the first time. The scene with Hermes Psychopompos and a small dancing Eros who leads a girl into Elysium has particular charm. A crater from Canicattini (PL. 76; *NSc*, 1920, p. 25, fig. 2) corresponds approximately to the period of the early Attic Kerch craters in style. The work of a Sicilian painter of about 350 B.C., the scene it presents is of interest technically for the attempt at a perspective rendering of the ceiling of the room in which the rites take place, as well as from the point of view of religious history in depicting the preparation of the initiates on the altar, the blood baptism of a nude girl, and the seated figures near the image of a divinity.

The drawing of the heads differs from the style of known south Italian painters and recalls the drawings on the Praenestine mirrors and cists, executed by engravers who had studied in this Siculan workshop.

The white vases found in Canosa and in other cities of Apulia, generally pitchers and askoi, have not yet been adequately studied. They were covered with a chalky slip and at times decorated with terra-cotta figures of the Tanagraean type, winged or wingless, and enriched with Gorgons and protomas. Their painting is in delicate pinks and light blues. Apparently this workshop was located in the area around Canosa and probably developed in the 3d century B.C., although most of the surviving vases seem to belong to the 2d century. In general, they are misinterpreted as the baroque degeneration of a provincial artistic strain. More thorough examination of the traditional figure types that recur might help to disclose the relationship between this representational world and eschatological concepts known to have been strongly rooted in southern Italy and Apulia. In the eastern Mediterranean area, vases with white engobe applied were also fashionable in the late 3d and the 2d centuries. In Alexandria, hydrias were the preferred form for such decorative treatment, while in the mother country and Asia Minor strangely squat lagynoi were customarily selected (Rumpf, *MZ*, pl. 54, 7). The latter type of pitcher also appears sporadically in Campania, but it was only in Kentoripa that it had wide diffusion and a particular vogue in the 2d and 1st centuries. More exhaustive study of these late Hellenistic vases in particular might indicate the extent to which Magna Graecian ceramics of this period depended on the lively cultural and artistic exchanges with the east. White-ground vases were also made in Taras and Boeotia.

The most important products of the late flowering of vase painting in Sicily are the funerary vases of Kentoripa, in some degree related to the ceramics of Canosa, though they nonetheless differ fundamentally in form and figure types. The scenes on these vessels, found in and made for tombs, express the wealth and complexity of the eschatological concepts of their milieu. The Kentoripa workshop probably began its activity in the late 3d century and continued until the 1st century, producing mostly calyx-craters that most likely served as cinerary urns, as well as some flat bowls with flattened conical covers. Usually they were decorated with superposed clay ornaments, and at times with relief heads and flowers (PL. 78; III, PL. 138, Centuripe). In the end such pottery degenerated into senseless ostentation. Still, vases of the early 3d century have a ceremonial beauty of their own, and the representations on calyx-craters and bowl covers give an idea of the importance of 2d-century painting. Apparently these scenes, or their models, influenced the Pompeian wall painting of the so-called "Style II." The most impressive of the vases represents Dionysos and Angelos. Others have female musicians, or are decorated only with painted heads, which perhaps represent the features of the deceased. Roundels with similar portraits have also been preserved, interesting in that they herald the *imago clipeato*. Unfortunately, modern restorers have so reworked them that their documentary value is very limited; they may even be modern forgeries (V, PL. 233), since all the examples apparently came from a single excavation (G. E. Rizzo, *MPA*, Centuripe, 1940).

ARTISTS (*Vase painters*). *Apulia*. Pisticci Painter, second half of 5th cent. B.C.: attributed 68 vases. – Amykos Painter, 430–400 B.C., active in workshop of Pisticci Painter: attributed 118 vases. – Dancing Girl Painter, 425–400 B.C.: attributed 13 vases, 1 fragment. – Sisyphos Painter, 425–400 B.C., active probably in Taras: attributed 21 vases. – Karneia Painter, belonging to group of Sisyphos Painter: attributed 1 vase. – Hearst Painter, circle of Dancing Girl Painter and Sisyphos Painter, early 4th cent.: attributed 12 vases, 3 fragments. – Sarpedon Painter, from workshop of Sisyphos Painter, 410–380 B.C.: attributed 5 vases, 1 fragment. – Dionysian Painter, known also as Painter of the Birth of Dionysos, direct successor to Sisyphos Painter, 410–380 B.C.: attributed 8 vases, 1 fragment. – Ilioupersis Painter, follower of Dionysian Painter, first half of 4th cent.: attributed 7 vases. – Lykourgos (Lycurgus) Painter, follower of Dionysian Painter, 350–225 B.C.: attributed mainly 7 vases, 1 situla. – Darius Painter, or Painter of the Persians, under the influence of Lykourgos Painter, last third of 4th cent.: attributed 6 vases. – Mythological Group, late 5th–early 4th cent.: Painter of Ruvo 1091; Painter of the Statue; Bendis Painter; Perseus Painter; Painter of the Theatrical Rehearsals; Painter of London F181–2; Judgment Painter; Amymone Painter; Ariadne Painter. – Tarporley Painter, early 5th–first two decades of 4th cent., derives from Sisyphos Painter: attributed 26 vases. – Group of the Tarporley Painter, ca. mid-4th cent.: Painter of Lecce 686; Painter of Bologna 497; Copenhagen Cork Group; Painter of Karlsruhe 39; Group of Madrid 11085; Painter of the Fat Duck; Eton-Nike Painter; York Painter; Painter of Bologna 428; Painter of the Long Skirts; Painter of Bari 1364; Painter of Athens 1714; Painter of Athens 1680; Painter of Bologna 589; Painter of Copenhagen 335; Painter of Vatican V5; Painter of the Musée Rodin; Skiron Painter. – Hoppin Painter, late follower of Tarporley Painter, 380–370 B.C.: attributed 7 vases. – Lecce Painter, late follower of Tarporley Painter, first quarter of 4th cent.: attributed 14 vases. – Hoppin-Lecce Group, 4th cent.: Eumenides Painter (?); Marburg Painter; Valletta Painter (?); Bucranium Group; Painter of Munich 3269; Painter of Sydney 46–48; Painter of Sydney 64; Lecce Group; Truro Group (derived from the Truro Painter); Thyrsos Painter; Berkeley Painter; Lampas Painter. – Truro Painter, late follower of the Tarporley Painter, second half of 4th cent.: attributed 2 vases. – Konnakis Painter, before the middle of the 4th cent.: attributed 2 fragments. – Stoke-on-Trent Group, late 4th cent.: attributed 19 vases, 3 covers. – Group of London F339, second half of 4th cent.: attributed 6 vases. – Kantharos Group, second half of 4th cent.: attributed 35 vases, 2 covers, 3 plates. – Group of Bologna 1366, related to Kantharos Group, second half of 4th cent.: attributed 3 vases. – Brunswick Group, dependent on Kantharos Group, second half of 4th cent.: attributed 2 vases. – Group of Reading 51.7.13, second half of 4th cent.: attributed 2 vases. – Toronto Group, second half of 4th cent.: attributed 2 vases, 1 cover.– Group of Taranto 2996, second half of 4th cent.: attributed 8 vases. – Amphorae Group, close to the contemporary Group of Taranto 2996: attributed 8 vases. – Copenhagen Group, second half of 4th cent.: attributed 8 vases. – Group of Lecce 866, second half of 4th cent.: attributed 2 vases. – Painter A of the Heroa Group, 340–330 B.C.: attributed 5 vases. – Painter of the Flat Noses, 330–320 B.C.: attributed 6 vases. – Gnathian pottery: Xenon Group, late 5th cent.: attributed 59 vases; Red Swan Group, 4th cent.: attributed 19 vases, 3 plates.

*Lucania*. Dolon Painter, successor of Pisticci and Amykos Painters, 5th–4th cent.: attributed 25 vases. – Creusa Painter, successor of Pisticci and Amykos Painters, late 5th cent.–ca. 360 B.C.: attributed 43 vases. – Choephori Painter, student of Creusa Painter, perhaps active in Armento, 360–330 B.C.: attributed 32 vases, 1 fragment. – Primato Painter, second half of 4th cent., perhaps student of Lykourgos Painter and active in Armento: attributed 48 vases. – Painter of Naples 1959, influenced by the contemporary Primato Painter: attributed about 50 vases. – Roccanova Painter, second half of 4th cent.: attributed about 50 vases.

*Campania*. Atticizing Group, early 4th cent. B.C.: attributed 9 vases. – Painter of Vatican U51, early 4th cent.: attributed 9 vases. – Group of London F525, 4th cent.: attributed 5 vases. – Owl-Pillar Group, 4th cent.: attributed 62 vases. – Possibly Capuan workshops: Cassandra Painter, second quarter of 4th cent.: attributed 5 vases; Capua Painter, first half of 4th cent.: attributed 9 vases; Parrish Painter, ca. mid-4th cent.: attributed 8 vases; Group of London F500, very close to the Parrish Painter, ca. mid-4th cent.: attributed 6 vases; Earring Painter, companion of Cassandra and Parrish Painters, first half of 4th cent.: attributed 10 vases; Ixion Painter, late 4th cent.: attributed 18 vases. – Archer Group, ca. mid-4th cent.: attributed 6 vases. – Workshop of Avella: Avella Group, ca. mid-4th cent.: attributed 30 vases; Danaïd Painter, ca. mid-4th cent.: attributed 18 vases; Frignano Painter, companion of Danaïd Painter: attributed 6 vases; Painter of London F196, ca. mid-4th cent.: attributed 3 vases; Manchester Painter, 330–320 B.C., influenced also by Cumae Group: attributed 17 vases. – Group of Capua Boreas, last quarter of 4th cent.: attributed 2 vases. – Painter of Catania 737, last quarter of 4th cent.: attributed 3 vases. – Plouton Painter, late 4th cent., attributed 2 vases. – Ghost Painter, late 4th cent.: attributed 9 vases. – Workshops of Cumae: Cumae A Painter, or Group, 350–325 B.C.: attributed 49 vases; Painter of New York 1000, companion of Cumae A Painter and Ready Painter: attributed 13 vases; Ready Painter, very close to Cumae A Painter, 350–325 B.C.: attributed 9 vases; A.P.Z. (Apulianizing) Painter, active particularly in last quarter of 4th cent., worked in shop of Cumae A Painter: attributed 26 vases; Nicholson Painter, last quarter of 4th cent., companion of A.P.Z. Painter: attributed 4 vases; Rhomboid Group, including Branicki Painter (4th–3d cent.: attributed 9 vases) and Painter of London F229 (4th–3d cent.: attributed 4 vases). – Barbarized Vases, late 4th cent.; Siamese Painter, attributed 7 vases; Majewski Painter, attributed 3 vases; Vitulazio Painter, attributed 3 vases; Riccardi

Painter, attributed 6 vases. – Head-Cruet Class, early 3d cent.: attributed 14 vases. – T.T. (Teano-Tübingen) Group, first quarter of 3d cent.: attributed 8 vases. – Kemai Group, first quarter of 3d cent.: attributed at least 36 vases. – Possible Siceliote workshops: Leontinoi Group, related to Cumae A Group, last third of 4th cent.: attributed 19 vases; Lipari Group, related to the contemporary Leontinoi Group: attributed 5 vases.

*Campanian or Paestan.* Caivano Painter, ca. 330–300 B.C.: attributed 19 vases, 2 fragments. – Painters close to the Caivano Painter: Errera Painter, ca. mid-4th cent.: attributed 8 vases; Group of London F223, ca. mid-4th cent.: attributed 2 vases; Group of Oxford 459, shortly after middle of 4th cent.: attributed 2 vases. – Lloyd Painter, third quarter of 4th cent.: attributed 2 vases. – Paestanizing Group, 4th cent.: attributed 10 vases.

*Paestum.* Revel Painter, first half of 4th cent. B.C.: attributed 6 vases, and perhaps another from Lipari. – Dirce Painter, first half of 4th cent.: attributed 8 vases. – Sikon Painter, of Dirce Painter Group, early 4th cent.: attributed 6 vases. – Lasimos (Λάσιμος), ca. mid-4th cent.: 1 signed amphora. – Assteas ('Ασστέας), active probably in Paestum ca. mid-4th cent.; created "Paestum style." Signed works: 1 lekythos (ca. 350 B.C.); 1 bell crater; 3 calyx-craters; fragments of a calyx-crater. Attributed: 22 vases (4 vases doubtful). – Altavilla Painter, appertaining to group of Assteas, 360–320 B.C.: attributed 28 vases. – Python (Πύθων), Assteas group, 350–320 B.C. Signed works: 1 bell crater. Attributed: 64 vases, 1 fragment. – Boston Orestes Painter, student of Python, 330–310 B.C.: attributed 33 vases. – Painter of Naples 1778, of the group of Python and Boston Orestes Painter, last quarter of 4th cent.–early 3d cent.: attributed 57 vases, 1 cover. – Painter of Naples 2585, late 4th–early 3d cent.: attributed 43 vases. – A.P.Z. Group (Apulianizing), late 4th–early 3d cent.: attributed 2 vases, several bottles, 2 fragments. – Painter of the Folded Cloak, second half of 4th cent.: attributed 9 bottles.

PAINTING. Painting in the west, widely employed but unfortunately now scantily represented, was especially fine in quality. By the end of the 5th century, Magna Graecian vase painting was clearly distinguishable from that of the mother country. In general, the West Greek paintings show more interest in space and foreshortening and often convey relationships of architecture, figures, and landscape. Among the more accomplished painters were Demophilos of Himera, who was probably active in the mid-5th century, since literary sources mention him as the master of Zeuxis (q.v.). He is perhaps to be identified with the Damophilos who worked with Gorgasos on the Temple of Athena (Ceres?), thereby carrying the influence of Sicilian and Magna Graecian art to Rome. More is known about Zeuxis of Herakleia, though with which Herakleia he is to be associated remains a mystery. In any case, it is certain that the high point of his work was reached at the end of the 5th century, when he painted in the palace of King Archelaos of Macedonia (413–390 B.C.). Since he is mentioned in conjunction with Parrhasios, he must have been one of the greatest painters of antiquity. It is difficult to form any idea of most of his works, among which have been listed a Zeus, an Eros, a bound Marsyas, Penelope, an athlete, and an old man. Some idea of his portrayal of Herakles strangling the serpents can perhaps be gathered from representations on Theban coins. Particularly famous was a painting of Helen in Kroton, preserved in the Temple of Hera Lacinia. Lucian also gives us a description of a family of centaurs by Zeuxis, of which he had seen only a copy, however. If his description is to be acknowledged as something more than a literary invention, the centauress must have been lying in a field, suckling her infants, while a centaur with a lion cub in his hand leaped down from a hill behind her. Here, too, as in south Italian vase painting, landscape elements were probably indicated. The description of the old centaur, wild and hairy, laughing and leering in an animal-like way, recalls the heads of the seilenoi and centaurs on Tarentine vases of about 400 B.C., and the exaggerated size of the heads referred to in his paintings also agrees with these Tarentine vase paintings. Zeuxis was famous especially for his use of chiaroscuro, a natural consequence of the special interest of West Greek artists in foreshortening and pictorial effects, and in which he was apparently preceded by Apollodoros of Athens.

It can be assumed that the burial chambers, particularly in Taras, in Apulia, and around Syracuse and Naples, were decorated with wall paintings as in Etruria, even if little has survived. A tomb with wall paintings was reputed to have been found at Taranto in 1916; however, this was destroyed before it could be salvaged. According to the verbal description of Paolo Orsi, its paintings were Polygnotan in type. Modest sarcophagus paintings, such as one from Vassalaggi (Syracuse, Mus. Arch. Naz.; Pace, II, 1938, p. 156), and those on the funerary cippi yield little information. A battle scene mentioned in the sources, which was in the Temple of Athena in Syracuse, may perhaps have resembled the painting of a battle of Amazons on an Etruscan sarcophagus in Florence (*JHS*, IV, 1883, pls. 36, 37). Stylistically, this seems so un-Etruscan and so close instead to Tarentine vase painting that it can perhaps supply some idea of Tarentine wall painting of about 400 B.C. Still unpublished are wall paintings that formerly decorated the chamber tombs of Taras, dating from the 3d and 2d centuries. Although no longer available for study, these works are documented by water colors executed at the time of their discovery and by the excavation journals. There is information that painted portraits of the Sicilian tyrants existed in Syracuse earlier than elsewhere, and this seems plausible, since the painters of Magna Graecia and Sicily showed a marked tendency to individualize faces as early as the late 5th century. A representation of an actor, a work now in Würzburg, might well be considered a portrait. The frescoes in Naples, no doubt from a 3d-century Gnathian tomb and preserved only in fragments, must have been paintings of fine quality (*RM*, XXVII, 1912, pl. 4). A hypogeum in Naples is decorated with excellent paintings that correspond to the Pompeian Style I and presumably belong to the 2d century B.C. The wall paintings of the burials of Ruvo (III, PL. 299; V, PL. 45), Canosa, and Paestum (PL. 72) are provincial by comparison and belong to the Apulian or Lucanian school. The same provincial taste is found in small *naiskoi* in Palermo, from tombs in Lilybaion, representing the deceased at the funeral banquet and having Greek and Punic inscriptions. They were inspired by the fashion of the tomb naiskoi documented in Greece, particularly in Pagasai, in the 2d century.

Only the Odyssey landscapes from the Esquiline (PL. 180; *RM*, LII, 1937, p. 38) can be considered to exemplify pure West Greek painting. Their Greek inscriptions testify that they were painted by Greek artists. The themes — the wanderings of Odysseus — fall within the province of West Greek mythology, but the specific characteristics that mark them as West Greek are the spatial conception of the scenes, the importance of landscape in relation to the human figures, the taste for perspective foreshortening, and figures painted almost in grisaille. In contrast to Alexandrian and East Greek landscape painting, in which landscape and architectural elements function only as a scenic backdrop, those of the Odyssey paintings constitute the first examples of western heroic landscape.

ARTISTS AND BIBLIOG. (*Painters*). Damophilos (Δαμόφιλος) and Gorgasos (Γόργασος), also coroplasts, Sicilian or Magna Graecian, active in Rome: paintings in the Temple of Ceres, consecrated 490 B.C. (Pfuhl, I, nos. 538, 542; Lippold, GP, p. 91; B. Pace, L. Guerrini, EAA, s.v. Damophilos). – Sillax (Σίλλαξ) of Rhegion, active probably at beginning of 5th cent. in Phlious (Room of the Polemarchs) and perhaps also in Sicily (G. Lippold, RE, s.v.). – Demophilos (Δημόφιλος) of Himera, according to some, the master of Zeuxis, perhaps to be identified with architectural theoretician of the same name, active ca. mid-5th cent. (ThB, s.v.; Pfuhl, II, nos. 741, 747; L. Forti, EAA, s.v.). – Zeuxis of Herakleia (q.v.). – Polyeidos (Πολύειδος), or Polyeides, active in Sicily ca. 400 B.C. (G. Lippold, RE, s.v., no. 13).

MOSAICS. For a long time it had been accepted that the mosaic technique known in Mesopotamia (see MOSAICS)

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

first appeared in the Greek world in Sicily, where it was subsequently developed. Other discoveries have modified this opinion, however, for it seems that Magna Graecian mosaic artists worked in Thessaly and northern Greece. A mosaic from Epidamnos seems to be of certain Magna Graecian origin, since it has a female head that closely approximates 4th-century Apulian motifs. Similar mosaics have been found in Motye. From Soloeis, at its zenith in the 2d and 1st centuries B.C., there are a number of surviving mosaics and wall decorations; just how typically Sicilian these are cannot be determined. A mosaic in Palermo from Palaiopolis (Pace, II, 1938, p. 180, fig. 167), commonly thought to be typically Magna Graecian, does not appear so to this writer. In general, with the officially sanctioned Romanization under Augustus, the taste for the Greek was in decline. There still must have been Magna Graecian artists, but probably not with styles distinct from the prevailing Roman. Thereafter, in the 2d and 3d centuries of our era, Sicily seems to have been strongly influenced by the flourishing North African provinces, particularly Mauretania. The degree to which the late-4th-century mosaics in Piazza Armerina are Sicilian or Magna Graecian has yet to be determined. Perhaps they are even Byzantine or Alexandrian, since the architecture found there seems neither Italic nor Roman.

COINS. The coins of Sicily and Magna Graecia are among the most beautiful of the ancient world. In the west, copper coinage was introduced much earlier than in Greece proper, as early as the mid-6th century B.C. The oldest West Greek coins are the oblong bronzes with the eagle head from Akragas, found together with small pieces of copper that did not have the customary round form of the coin but rather that of Oriental cylinder seals. Gold coinage, still rare at the beginning of the 5th century, was also introduced earlier in the west than in the mother country: only the gold messenion in the Pennisi Collection in Acireale and coins from Cumae and Syracuse can be cited. Incuse coins are characteristic of the Achaian colonies of southern Italy, particularly Sybaris, Metapontion, Poseidonia, and Kaulonia. Their form — a thin disk, on one side concave and on the other convex, and all bearing the same image — can be explained only by the likelihood that the places issuing them did not find it desirable to give small-value coins the tiny size sometimes used in Greece for the drachma and the obol.

Unlike the mother country, the cities of the west placed particular value on more elaborate and distinctive coins. The beauty of Sicilian and Magna Graecian coins gave them a propaganda function as well, and cities that had a stable economy and solid financial standing varied their coin type very little. The most beautiful Siculan coins were struck after the victory of the Syracusans at Himera in 479 and on the Asinaros in 413, and by the Akragantines after their victory over the Carthaginians in 410. Early in the 3d century B.C. the coins of southern Italy already mirrored historical events. Thus, about 270, Lokroi issued coins displaying the Fides (Pistis) to commemorate a pact with Rome. Designations of value, found first on the copper coins of Syracuse, Akragas, and Gela, must have been required in the west for trade with the Italic peoples.

It has not yet been possible to ascertain whether the artists who created coin types were natives or wandering artists, or if the various types were imported from the mother country. The close artistic and cultural ties of Syracuse and Taras with their respective metropolises in the 6th and early 5th centuries B.C. suggest the possibility that both coins and dies were imported from the mother country. In this event, the similarity of the coins of Velia (Elea) to those of Pherai, and the ones of Medma to those of Iolkos (near mod. Volos), should not be overlooked. Numerous stylistic affinities between coins of the eastern and western Greek territories can be discerned elsewhere; hence it is probably not merely coincidental that, after the occupation of Zankle-Messana by the Samians, the head of the bull on the coins of the Sicilian port became similar to the bull heads on Samian coins. The earliest coin types were probably created in the cities that excelled in metalwork and glyptics, such as Corinth. Attic artists may also have produced some prototypes, for example, the oldest and most beautiful coins with Apollo, from Leontinoi.

Artistic stimuli from Greece proper were swiftly and effectively developed in the west: the magnificent Syracusan coins form the most revealing series created in Sicily and Magna Graecia. The carefully controlled issue and great variety of types indicate how much in demand Syracusan coins must have been. It is still not clear why the oldest Syracusan coins bore a small head inserted in the middle of the incuse square, following a practice no longer current in the Greek coins of the period (ca. 530; Boehringer, 1929, pl. I). The oldest of these coins recall East Greek models, both in their heads (I, PL. 375) and in the representation of the Nike's chariot, while those of a slightly later date, with the inscription "Syrakosio" instead of "Syra," are of a more modest, probably Corinthian, type. Because of its thriving economy, Syracuse long retained on her coins the head of Arethusa and the quadriga (III, PLS. 384, 394, 397), but the stylistic variety in the heads is nonetheless extremely interesting. The Syracusans seem to have sought engravers from the most diverse cities. The similarity of the heads of Arethusa (Boehringer, 1929, pl. III, 50) to those of the Euphronios bowl by the Panaitios Painter (Louvre; A. Furtwängler and K. Reichhold, *Griechische Vasenmalerei*, ser. I, Munich, 1900–04, pl. 5) is so strong that it implies some bond with Attic art, unless an Attic vase painter had simply created the sketches for these West Greek coins. In some coins the facial characteristics are decidedly Doric (Boehringer, 1929, pl. VIII, 209), whereas other heads have a clear East Greek profile, and the beaded treatment of the hair testifies in favor of a bond with Ionian art (Boehringer, 1929, pl. III, 65, 66, 70). Besides these masterworks, quite ordinary types (Boehringer, 1929, pl. VII, 163) are found, with varied stylistic elements poorly integrated, for example, a coin with a head surrounded by dolphins, disproportionately short legs on the horses, and sloping profiles.

The coins of Katana evidence a similar variety of facial types. Here, too, it is amazing to see, side by side with the magnificent head of Apollo, issues in which the head of the god exhibits qualities provincial and un-Greek in the accentuated slant of his profile as well as in his expression. In Syracuse, particularly, there were extraordinarily flat and unusually linear coin types, which recall heads on the reliefs of Lokroi and which might mean that the engravers came from the area colonized by the Achaians. After the Persian Wars, the style of the Arethusa heads no longer varied so greatly, and from then until the end of the 5th century an unrivaled series of coins was developed.

The Syracusan artists playfully adapted the customary insertion of a head or a figure in the circle of the coin by the balancing effect of dolphins encircling it. The coins of Syracuse in particular afford a comprehensive view of artistic development from the archaic through the severe and classical styles up to the Grecian "baroque." As so often occurred in Greek art, when an artistic type achieved its finest expression, the pride of the artist was expressed in a signature. Especially in the late-5th-century coins, either the names of masters (e.g., Euainetos, Kimon, Phrygillos, Eumenes, Herakleidas) are set down or a definite artistic personality is recognizable in the individual coins. This is particularly true of the decadrachmas. Occasionally the engravers used only their initials or a symbol: Phrygillos, for example, incised a finch. The signatures of some artists on Syracusan coins also clearly indicate that they worked for several cities: Phrygillos, for instance, also engraved coins for Terina, Metapontion, and Thourioi. Next to the restrained, mature classic facial features of Euainetos (III, PL. 384) and Eumenes, the heads of Kimon, with their billowing hair, are exaggeratedly expressive and almost baroque. The beauty of the heads of Arethusa fired the enthusiasm of the engravers of Greece itself to such a degree that, transformed into Demeter, the type was copied on coins of Locris Opuntia and Pheneos. Larisan coins were designed to emulate the beauty of the Syracusan models. The sense of space in West Greek art resulted in more frequent use of the three-quarter view than prevailed in the Greek motherland. A splendid head of the early

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

classical period is represented on a coin of Gela; similar heads are often found on coins of the years 413–410 by Kimon. The late head of Apollo by Herakleidas, with the god represented almost full face, seems to have been similarly inspired, but Herakleidas lost himself in the details of the hair and never attained the magnificent effects of Kimon. This novel presentation, contrary to the usual artistic types of coin decoration that reproduced a frontal god's head, was then taken up in the motherland on the coins of Ainos. The splendid Syracusan coinage of this period was considered the "classic" standard even in antiquity, that is, from shortly after 400. Carthaginian engravers imitated these coins, but in the Punic examples a certain coldness and hardness is evident.

The influence of the Syracusan coins is also illustrated by the fact that casts of these coins were frequently used to decorate bowls, especially in Teanum Sidicinum and Cales and in other cities of central Italy. Indications of this high standard can be found in 4th-century Neapolis (PL. 80), and from Campania the influence spread throughout central Italy. On the tetradrachmas of Eumenes (425–413), the characteristic feature of rearing or galloping horses is first encountered; later this motif appears frequently on coins of the Roman Republic (Rizzo, 1946, pl. 42). In the 4th and also in the 3d century, Syracusan coins became increasingly simple and modest, losing some of their former exuberance and elaboration.

The period of greatest refinement in the coinage of the other cities of Magna Graecia and Sicily was not the outcome of political circumstance, nor did it have a duration equal to that of Syracuse, even though coins of great beauty were produced everywhere between 450 and 350. Some late-5th-century coins from Akragas compare with the Syracusan ones: the eagles tearing a hare to pieces (III, PL. 397), with an energy almost overflowing the limits of the coin itself, are the expression of a brief, heady victory of the city. The coins of Metapontion, much more restrained in both form and expression, are ornamented with delicate heads of Demeter, evidently created by an Ionian artist, who also cut the models of many coins for Terina. The coins of Kroton (III, PL. 396) with the three-quarter head of Hera, inspired by a painting of Zeuxis or perhaps by the coinage of Pandosia, are more closely related to the Syracusan art of the late 5th century. The coins of Thourioi and Herakleia preserved some of the restraint and force inherent in those of the motherland.

A certain formal austerity, analogous to that of the coins of Metapontion, is also dominant in Catanian coins, distinguished for linear terseness and an almost classic execution of profile. Coins of other localities are more ordinary and provincial, since many cities do not seem to have cared whether their coins were in great demand. The coins of Gela (PL. 80) can be identified by their flat relief and accentuated linear stylization. In the coinage of cities less Greek in cast, such as Enna, Segesta, Himera (III, PL. 395), and Cumae, the strongly slanting Italic profile reappeared. Of additional interest is the fact that typically Punic cities such as Motye (*Sylloge Nummorum Graecorum*, II, parts I–II: The Lloyd Collection, London, 1953, pl. I, 11, 39) seem to have taken the coins of Kolophon as models.

The coinage of Sicily and Magna Graecia reached a classic peak at the end of the 5th century, with perfect correspondence between the representation and the round form of the coin. One of the most successful subjects is that of Herakles fighting the lion (III, PL. 384), found on the coins of both Syracuse and Herakleia. The figures, placed in the tondo with ease and naturalness, have such beautiful modeling that it may be assumed that the sketch was the work of a great toreutic artist, perhaps even a sculptor. This Herakles type was thereafter adapted in the decorative arts and survived in more modest form in the terra cottas of central Italy (*AAnz*, LXXI, 1956, col. 447, fig. 159). The coin types of the 4th century continued to be inspired by the 5th-century elaboration, with only slight modification. After their occupation of the Greek cities, the Romans generally preserved the existent designs, but their versions do not seem to have retained the vitality, forcefulness, and beauty of the originals. As with the other arts, coinage also entered a period of decline.

ARTISTS AND BIBLIOG. (*Coin engravers*). *Akragas*. Myr[. . .] (Μυρ[. . .]), active ca. 413–411 B.C. (Regling, ThB, s.v.; Rizzo, 1946, p. 89, pl. II, 5–6). – Polykr[. . ] (Πολυκρ[. . ]), integrated into Polykr[ates] or Polyk[leitos], perhaps native of Elis, active 412–406 (Rizzo, 1946, p. 88, pl. II, 2–2a). – *Kamarina*. Eche[. . .] (Ἐχε[. . .]), active 420–405, identified by Forrer with Exakestidas (Rizzo, 1946, p. 49, pl. V, 10). – Eukleidas (see below under *Syracuse*). – Euainetos (Εὐαίνετος), active in last quarter of 5th cent. in both Syracuse and Katana, probably pupil of Eumenes (A. Gallatin, Syracusan Dekadrachms of the Euainetos Type, Cambridge, 1930; Rizzo, 1946, pp. 98, 199 ff., pls. VII, XIV, XLII; L. Breglia, EAA, s.v.). – Exakestidas (Ἐξακεστίδας), active 420–405 (Weil, ThB, s. v.; Rizzo, 1946, p. 94 ff., pl. V, 11–13, 16; A. Stazio, EAA, s.v.). – Yl[. . .] (Ὑλ[. . .]), uncertain name, active 420–405 (Rizzo, 1946, p. 97, pl. VII, 3–4). – *Katana*. Kra[. . .] (Κρα[. . .]), active ca. 430 (Rizzo, 1946, p. 105, pl. X, 9). – Choirion (Χοιρίων), active 413–403 (Weil, ThB, s.v.; Rizzo, 1946, p. 111 ff., pl. XIV, 13 ff.; A. Stazio, EAA, s.v.). – Euainetos (see above under *Kamarina*). – Herakleidas (Ἡρακλείδας), active 413–403 (Regling, ThB, s.v.; Rizzo, 1946, p. 210 ff., pl. XIV, 1–3, 10–11; A. Stazio, EAA, s.v., no. 1). – Prokles (Προκλῆς), active in Naxos also, late 5th cent. (Rizzo, 1946, p. 112, pl. XIV, 16; p. 156, pl. XXVIII, 25). – *Himera*. Kimon the Elder (Κίμων), active perhaps in Himera ca. 440–430; by some held to be the grandfather of Kimon of Syracuse (see below under *Syracuse*); by others, identified with him (Regling, RE, s.v., no. 12; Rizzo, 1946, p. 126, pl. XXI, 12). – Mai[. . .] (Μαι[. . .]), perhaps active in Himera 413–409 and in Syracuse after the destruction of Himera (Rizzo, 1946, p. 127, pl. XXI, 23). – *Messana*. Ana[n?] (Ἀνα[ν?]), active 425–415 (Rizzo, 1946, pl. XXVII, 6). – *Metapontion*. Aristippos (Ἀρίστιππος), active first half of 4th cent. (S. P. Neo, The Coinage of Metapontum, New York, 1931, p. 48, 122, no. 503). – Poly[. . .] (Πολυ[. . .]), active ca. mid-4th cent. (Regling, ThB, s.v.). – *Naxos*. Prokles (see above under *Katana*). – *Rhegion*. Kratesippos (Κρατήσιππος), active late 5th–early 4th cent. (H. Herzfelder, Les monnaies d'argent de Rhegium, RN, 1955, p. 52 ff.). – *Syracuse*. Sosion (Σωσίων), active ca. 440 (Regling, RE, s.v.; Rizzo, 1946, p. 200, pl. XLIII, 2). – Eumenes (Εὐμένης), or Eumenos, active between 440 and 420–415, probably master of Eukleidas and Euainetos (Weil, ThB, s.v. Eumenos; Rizzo, 1946, p. 200 ff., pls. XLII–XLV; L. Breglia, EAA, s.v.). – Eukleidas (Εὐκλείδας), active late 5th cent., perhaps also in Kamarina, probably pupil of Eumenes (Weil, ThB, s.v.; Rizzo, 1946, p. 202 ff., pl. XLII ff.; L. Breglia, EAA, s.v.). – Euainetos (see above under *Kamarina*). – Euarchidas (Εὐαρχίδας), active 420–410 (Weil, ThB, s.v.; Rizzo, 1946, p. 207 ff., pl. XLIII, 13–14; A. Stazio, EAA, s.v.). – Euth[ymos] (Εὔθυ[μος]), active late 5th cent. (Weil, ThB, s.v.; Rizzo, 1946, p. 205, pl. XLIII, 10–12). – Im[. . .] (Ἰμ[. . .]), active late 5th cent. (Rizzo, 1946, p. 223, pl. XLVIII, 2, p. 226, pl. XLVIII, 19; Jongkees, 1941, p. 48 ff.). – Kimon (Κίμων), active ca. late 5th cent. (Jongkees, 1941; Rizzo, 1946, p. 222 ff., pl. XLVII ff.). – Mai[. . .] (see above under *Himera*). – Parme[. . .] (Παρμε[. . .]), active in last decade of 5th cent. (Seltmann, RE, s.v., Rizzo, 1946, p. 220 ff., pl. XLVII, 16 ff.). – Phrygillos (Φρύγιλλος), active ca. 420–410, possibly also in Terina and Thourioi, perhaps also a gem engraver (J. Sieveking, RE, s.v.; Rizzo, 1946, p. 205 ff., pl. XLIII, 2). – *Terina*. Phrygillos (see above under *Syracuse*). – *Thermai*. Kle[. . .] (Κλη[. . .]), active ca. mid-4th cent. (Rizzo, 1946, p. 128). – *Thourioi*. Phrygillos (see above). – Molossos (Μολοσσός), active late 5th–early 4th cent. (Regling, ThB, s.v.). – Historos (Ἱστορος), active first half of 4th cent. (S. P. Noe, The Thurian Di-staters, Numismatic Notes and Monographs, no. 71, New York, 1935, p. 12, p. 40, no. B6). – *Velia*. Hera[kleidas] (Ἡρα[κλείδας]), active early 4th cent. (J. Babelon, Catalogue de la Collection De Luynes, I, Paris, 1922, no. 647). – Kleudoros (Κληύδωρος), active first half of 4th cent. (Regling, ThB, s.v.). – *Gem engravers*. Phrygillos (Φρύγιλλος), late 5th cent., perhaps to be identified with the coin engraver (see above): signed cornelian scaraboid, formerly Coll. Blacas, subsequently lost; a glass impression (J. Sieveking, RE, s.v.).

ART OF WEST GREEK COLONIES OUTSIDE ITALY. *Gaul*. Apparently the colonization of the southern coast of Gaul did not begin until about 600 B.C. At the mouth of the Rhone, Phokaian colonists founded Massilia (Marseilles), whose settlers then founded Tarente, Olbia near Hyères, Antipolis (Antibes), Nikaia (Nice), Agathe (Agde), and Foce (Phokaia?). These cities in turn colonized the Spanish east coast. Excavations in Mont-Lassois, Glanum, Entremont, and Enserune reveal the Hellenization of the Celtic *oppida* in the late 6th and 5th centuries. Unfortunately, very little has survived in Marseilles, which by the end of the 6th century B.C. had become one of the richest cities of the Greek west and had even built a treasury in Delphi. The railroad station now covers the ancient acropolis. In the

Rue Négrel there must have been a sanctuary of Meter, as indicated by the small, mainly 6th-century naiskoi found there, which often have Greek stylistic features. A head of a youth in Auxerre (Espér, 2929) could be 5th-century subarchaic, and so could the Nîmes head found near Sommières (Espér, 2694). Both these sculptures, as well as the Arles lion (Espér, 2520), are considerably barbarized in form, and they cannot be dated with precision. On the whole, it is not improbable that these pieces belong to a much later period. The enthroned Meter (Espér, 8323) reveals a Greek influence in dress and coiffure, but here again the date is controversial. The large Ionic capital brought to light in the port of Marseilles could belong to the late 5th century. Unquestionably of West Greek origin is the head that juts from a volute bracket in Toulouse, which recalls some of the Selinous heads (*FA*, I, p. 301, fig. 99).

Close artistic bonds with Athens seem to have been established as early as the late 6th century, as indicated especially by the rich vase finds of Saint-Mauront and Ensérune. A stele (Espér, 3450), with a representation of Artemis (?), perhaps a votive relief, resembles 4th-century Attic sepulchral reliefs; but the Greek type has been transformed — particularly in the leaf capitals of the pilasters and the oversized bow — to satisfy provincial taste. This barbarization is still more marked in a relief with Eros in Nîmes (Espér, 831) and in one with Attis in Marseilles, which are probably late Hellenistic or even Roman. The Arles heads are much better preserved. Although they may be late Hellenistic, they reflect the baroque Pergamene style.

Of much higher quality is an altar in Paris, late Hellenistic in style but perhaps created after the Roman occupation of Gaul (Espér, 3147). The structure of the figures and their movement are late Hellenistic, resembling forms in the art of Asia Minor which survived into the Imperial age. The same trend, embodying the transition to Gallo-Roman sculpture, is evident in a fine relief in Reims (Espér, 3664) and a monument in Avignon (Espér, 271) commemorating a Gallic victory, on which the shields are of Hellenistic rather than Roman form. Roman armor does appear, however, on a similar monument from Vachères, now in Avignon. The reliefs on the Mausoleum of the Julii in Saint-Rémy (V, PL. 470) are also late Hellenistic. The influence of Magna Graecia and Sicily is particularly evident in the form of the pilaster sepulcher, which also predominates in numerous more modest examples from Glanum. The Corinthian capitals with their curled leaves strongly recall 3d- and 2d-century Syracusan capitals. The sense of space often present in the art of Magna Graecia and Sicily completely pervades the battle scenes, from the powerful foreshortening to the attempt of the artist to lead the eye into the depths of the tumult. Some reliefs on the early Imperial arch in Orange (V, PL. 470), equally untouched by Augustan classicism, reflect the same type of late Hellenistic West Greek relief sculpture, thus demonstrating the force with which the sculpture of Magna Graecia and Sicily survived in southern Gaul. Study of the different artistic and cultural currents in the rest of Gaul, which included Germany in the Imperial age (figured capitals in Metz; Espér, 4466), is not sufficiently advanced to provide a precise picture of the survival of Greek art in this region, but Merovingian and Carolingian church architecture suggests that artistic ties with the Greek east were quite strong in late antiquity and the early Middle Ages (see CELTIC ART; GALLO-ROMAN ART).

*Spain.* The first colonies on the Spanish east coast — Rhoda (mod. Rosas) near the foothills of the Pyrenees, Ampurias farther south, Hemeroskopion at Cabo de la Nao, and Mainake (mod. Málaga) on the south coast — were founded by Phokaian settlers from Marseilles after the foundation of that city (ca. 600 B.C.). The finds leave little doubt that these widely separated cities were mainly responsible for the dissemination of Greek culture in Spain, even if they were not the only early colonies. Actual colonization was probably preceded, as in Italy, by the establishment of commercial relations — as early as the 7th century, Kolaios of Samos had sailed to Tartessos, and this was not necessarily the first such contact between east Greece and Spain. Archaeological finds, however, such as the fragments of Mycenaean vases found in southern Spain and the Cycladic pitcher of the late 2d millennium in Minorca, have been too meager to allow the identification of possible colonies.

The decoration of many Iberian vases was inspired largely by proto-Geometric models. Two favorite motifs, which survived until the 4th century, were concentric semi- and quarter-circles. Superposed rows of dots recalling the so-called *Flimmerstil* of the Geometric period might indicate a relationship with 8th-century Greek pottery. In both decoration and form the egg-shaped vase from Galera (Menéndez Pidal, I, 1947, 3, fig. 541) is in a provincial Greek Geometric tradition, perhaps Cretan. Greco-Iberian taste can be recognized in the linearity and unstructured ornament which characterized this art until late Hellenistic times.

In the 6th century the number both of imported Greek objects and of Iberian copies increased. It is curious that little East Greek pottery has been found in this area, while Corinthian and Attic black-figured and red-figured wares are plentiful in Iberian tombs. It is hard to imagine that these works, generally of little artistic value, were imported from Athens as finished products — they probably were manufactured by potters settled in Spain. The early 4th-century bell crater with the Judgment of Paris from Galera (García y Bellido, 1948, pl. 135, 2) is unquestionably a Greco-Iberian work by a draftsman who transformed his Attic models rather freely. The head of a bull coming out of the ground in front of the almost floating, seated figure of Paris is surely an invention of this painter. The absence of Aphrodite can probably also be attributed to provincial simplification. The Iberian origin of the vase is suggested chiefly by the appearance of the concentric semicircle motif, edging the hems of Athena's and Hera's skirts. In the 5th and 4th centuries there seems to have been no importation from Magna Graecia and Sicily, while in the 3d century black-finished, fluted vases were imported from Campania and Sicily and were copied locally.

The number of terra cottas preserved is much larger. Some are imported products of Greece, Sicily, or Italy (*ibid.*, pl. 146, 2), and some are Iberian copies. The copies often incorporate Magna Graecian and Sicilian motifs modified to some extent to conform to the ritual and cult needs of Spain (*ibid.*, 17). The most noteworthy example is the Demeter from Ampurias (*ibid.*, pl. 157), whose physiognomy has an undefinable Spanish quality, although the piece is of a type related to the best Siculan terra cottas. The form of a terra-cotta bust from Ibiza (*ibid.*, pl. 147) and the coiffure represented recall types frequent in southern Italy. The Iberian character of another Demeter from Ibiza (*ibid.*, pl. 149) is even stronger, with an overladen headdress and a soft dissolution of the plastic form.

Here too, as in southern Italy and Sicily, Greek and indigenous elements are mixed to different degrees, though in Spain a strong Punic component is generally present as well. In the terra cottas from Cerro de los Santos, for instance, the Greek tradition accounts for only the basic types and the handling of drapery, while the dominant Punic element is seen in the solidity and stylization of the figures, especially the heads. Other terra cottas, no matter how strongly they may be influenced by Greek taste, still show the Iberian disregard of plastic form. An example is the enthroned goddess from Ibiza (*ibid.*, pl. 148) whose breast is decorated with fruit. Still another aspect of the Iberian artistic language is found in a head from Ibiza (*ibid.*, pl. 150, 8), whose slender, elongated head and severe modeling of features, especially the incised eyebrows, reveal a Laconian influence. The stylistic affinity of many terra-cotta busts with Akragas works of the late 5th and 4th centuries is particularly interesting. The latter probably reached southern Spain by way of Carthage. A bust from Puig d'es Molins (Menéndez Pidal, I, 1947, 2, p. 427) has hair across the forehead stylized in wavy lines just like some terra cottas of Akragas. In this and similar busts, the Punic-Iberian element is recognizable in the extension into depth of the bust and chiefly in the non-organic quality of the anatomy. The Seilenos mask from Ibiza (García y Bellido, 1948, pl. 150, 9) could have been inspired by those found in Gela, but if so, it has undergone a considerable transformation, without doubt corresponding to Punic taste. On the other hand, the male and female heads from Ampurias,

Benidorm, and Albufeira belong to a group of works purely Greco-Iberian, uninfluenced by Carthage, examples of which are found as far away as southern France (Ensérune). A head decorated with bunches of grapes, perhaps a Dionysos (*ibid.*, pl. 160, 29), has the characteristically thin Iberian lips.

The particularly large-grained Spanish marble does not seem to have been used for sculpture until the period of the Roman occupation. Previously, the usual carving material had been limestone, probably stuccoed and painted. The most interesting of these early limestone works is the bull-god from Albacete, which follows the Greek type of Acheloos and Gela. The body of the seated Sphinx from Agost (*ibid.*, pl. 63), whose head is unfortunately very mutilated, is closer to Greek forms in its structure, strongly resembling the Naxian sphinx. This figure is certainly from the late or even early 5th century. An example of a more distinctly Punic motif is the enthroned goddess flanked by two sphinxes, from Galera (Menéndez Pidal, I, 1947, 2, fig. 384). Many of the limestone figures which have been found seem earlier than they are proved to be by excavation data or certain stylistic details. The finds of Osuna (anc. Urso) assume particular interest from this point of view. The reliefs with battling warriors recall in many respects Greek severe-style figures, but the elongated oval shields the warriors bear are definitely a Hellenistic motif. The heads of Cerro de los Santos (*ibid.*, 3, p. 483 ff.), despite severe and late archaic touches in the execution of the eyes and hair, nonetheless cannot be dated earlier than the late 5th or 4th century.

The works considered so far represent a modest provincial art of hybrid character. In limestone heads of finer quality, however, typically Spanish features can be recognized as early as the 5th century. The fine, narrow kore heads from Barcelona, which evidently are related to East Greek heads, are given a Greco-Spanish quality by the slightly mannered, stylized accentuation of the individual parts and the strong linearity of the hair. The most important monument of this kind is the "Lady of Elche," the fragmentary upper part of a statue of a goddess (IX, PL. 409). The complicated wheel-shaped hairdo that covers her ears and her pointed cap are still found in Spain. A full cloak falls symmetrically from her shoulders in careful zigzag folds, after the Greek preference. The forehead is decorated by many circles, to be visualized in gold, as are the large hair-wheel decorations over the ears, from which long golden earrings hung. The breast is decorated with a rich pectoral. The form of the head recalls that of many Selinuntine marble heads, but the fold of the eyelids is much closer to some East Greek heads. The "Lady of Elche" is the first Iberian sculpture of really high quality. In her proud and serious features there can be glimpsed something of the distinctive Spanish countenance that only later fully revealed itself.

The oldest marble sculpture found in Spain is the cover of an anthropoid sarcophagus from Cadiz, which may be a Greco-Syrian import and which can be dated to the early 4th century by the shape of the head. It is uncertain whether other marble finds, such as the female head from Ampurias (García y Bellido, 1948, pl. 61), were produced locally or imported from the east. This is also the case with the *Asklepios* from Ampurias (*ibid.*, pls. 57–60), which because of its similarity to the *Poseidon* from Melos can be dated to the Hellenistic period. The oldest Greco-Iberian marble figures are the two reclining women from Bornos, now in the Parco Medinaceli in Madrid. The date of these figures, whose iconographical meaning is unknown, is not established, but the similarity of their complicated headdress to that of some heads in Seville suggests a date in the late 4th century.

The particularly large number of bronze works brought to light in Spain reflects the local abundance of ore, which was partly worked in Spain and partly exported in exchange for finished products. Finds of bronzes imported from Greece include a magnificent Corinthian helmet from Ría de Huelva (*ibid.*, pl. 22), a Spartan peplos figure (*ibid.*, pl. 25), a running Seilenos (*ibid.*, pl. 26), and a winged sow (*ibid.*, pl. 28), probably a fragment of a large bronze vessel cast in Spain of Anatolian components. The provenance of a helmet found at Jerez has not been established, but the work is of a 7th-century Corinthian type and may have belonged to a Greek mariner who sailed to Spain. Among the Greco-Iberian bronzes discovered is an interesting female figure (*ibid.*, pl. 44) modeled on Locrian bronzes, which was found in Mallorca. Other finds that are probably Greco-Iberian are a bronze Herakles with quiver (*ibid.*, pl. 23) from Mallorca, a bronze from Avignon, and a youth with arms akimbo, now in Boston. The Despuig head, from Mallorca (Copenhagen, Ny Carlsberg Glyptotek, no. 29), shows a decided Etruscan influence, though it may be an Iberian work. The grimacing, helmeted, nude warrior from Mallorca (García y Bellido, 1948, pl. 36), whose disproportionately large head contrasts with the rest of his body, is probably Spanish.

It is easier to identify provincial Spanish bronzes, such as the warriors with the Boeotian helmets (*ibid.*, pls. 46–47) and the warriors from Capdepera and Lluchmayor (*ibid.*, pls. 48–51). These probably belong to the late Hellenistic period, despite the antiquated form of their helmets and their severe expressions. The flute-blowing satyr from Jaén (*ibid.*, pl. 55, 38) is of another local type; he wears a non-Greek type of garment, and the fluid form of his long body has an unmistakably Iberian quality. As in the art of Magna Graecia and Sicily, so in that of Iberia the progressive degeneration of forms may be traced, especially in the bronzes from Despeñaperros (IX, PL., 410) and Jaén (Menéndez Pidal, I, 1935, p. 403), in which the artist concentrated more on the forms of the head than on the organic structure of the body.

The gold diadems and pectorals of Spain, particularly those from Aliseda (*ibid.*, pp. 479 ff.), are among the most significant goldsmiths' works of antiquity. They are made of extremely thin granulated gold, which gives them almost the character of crocheted lace. The Punic influence on Spanish goldwork is very strong, but many works, particularly the small gold leaves from Braganza (García y Bellido, 1948, pl. 167, 7), show the influence of Greek ornament. These leaves evidently imitate Syracusan tetradrachmas of the late 5th century, just as numerous Spanish coins reproduce Sicilian and particularly Syracusan designs (*ibid.*, pl. 168; see HISPANO-ROMAN ART; SPAIN).

GRECO-PUNIC ART. No Greek colonization was possible in the coastal areas of North Africa, around Carthage, that were dominated by the Punic peoples. Only east of the Carthaginian sphere of influence could Greek colonies be founded: in 630 B.C. the Therans settled Cyrene, a city which remained powerful until late antiquity; from this base, Teucheira and Euhesperides were established. Under the Ptolemies (300 B.C. onward) Cyrene became a cultural center of great importance, broadcasting currents of art and civilization to southern Italy and, when Punic power declined, even to Carthage. On the North African coast, near Sicily, was found a small funerary monument (Picard, 1956, p. 24, pl. 9) containing, remarkably, late 8th-century Geometric vases. The monument has been connected, with some likelihood, with Dido, founder of Carthage. The grave is purely Phoenician, like those of Ugarit (mod. Ras-Shamra), but the vases are Greco-Cycladic, imported rather than locally produced. Everywhere on the Mediterranean coast Greek vases have been found: in the 6th century Corinthian, then Attic, products predominated; in the 4th century, Campanian. The Punic peoples, like the Phoenicians, were admirers of Greek art and in the 4th century imported terra cottas that reproduced archaic Greek types of enthroned goddesses and busts. Etruscan ivory works with Etruscan inscriptions have also been found in Carthage (A. L. Delattre, *La Necropole punique à Carthage*, Paris, 1898, figs., 12–14). As in Phoenicia, Cyprus, Gaul, and Spain, so in Carthage Greek terra-cotta types were reworked to satisfy local preferences.

More interesting are the so-called "razors," which are probably ax amulets, a typically Punic form. Shaped like the blade of an ax, they end in a bird's head, with a suspension loop at its neck. Most of these objects are decorated in Phoenician style, with flowers, fish, and birds, though Egyptianizing gods and demons appear as well. Some, however, seem to have been decorated by Magna Graecian engravers in the late 5th century. One interesting example, in Punic style, shows Isis on one face, Hermes on the other; another, apparently by a

Magna Graecian master, depicts Scylla as well as Herakles wrestling with the lion.

In the 4th and 3d centuries B.C., the Semitic Carthaginians overcame their religious aversion to figural representation, evidently under the influence of Greek culture. Virtually pure Greek forms appear on incised grave steles with Punic inscriptions (Picard, 1956, pl. 60) and on a Punic grave or votive stele in Tunis, which has a female figure recalling the style of the "Sarcophagus of the Mourning Women," from Sidon (III, PL. 379). Greek artists working in Carthage invented a form of great subsequent importance: the reclining figure on the lids of sarcophagi. Examples of this motif, which first appeared in the 4th century, are in the Louvre and in Tunis. Figures carved in the round are understandably rare. Apparently, marble and terra-cotta figures were produced only after the fall of Carthage, perhaps by the Alexandrian artists who later settled in Mauretania (Picard, 1956, pls. 66, 67).

The influence of Greco-Siculan art on 5th-century Mauretania is evident in the Medracen, a colossal sepulcher near Algiers, which consists of a cylinder 193 ft. in diameter, decorated with 60 Doric engaged columns and topped by a 24-stepped cone. In date and style the capitals are close to those of the temple at Segesta, while the crowning of the monumental gateway has vaguely Egyptianizing profiles, such as are found on the Temple of Demeter Malophoros near Selinous. In structure the sepulcher can be compared with Phrygian and Etruscan funerary buildings. The wide diffusion in Mauretania of this type of building, on a smaller scale, supports the hypothesis that the Medracen is the sepulcher of a Mauretanian king of about 400 B.C. Another monument of this type is the so-called "tomb of the Christian woman" (I, PL. 18), which may be the royal sepulcher near Caesarea mentioned by Pomponius Mela (*De Chorographis*, I, 26, 30). This structure consists of a low cylinder 203 ft. in diameter, ringed by engaged Ionian columns. Particularly interesting is the vaulted corridor leading to the burial chamber. The slenderness of the doors and the proportions of the building suggest a date in the late Hellenistic period. The round capitals with palmettes between the volutes are so close to 4th-century Ionic capitals of Taras that a bond with Tarentine architecture is assured, even though the forms of the Mauretanian monument are more rigid.

The strong Alexandrian influence on Mauretanian art until the Arab conquest is best seen in mosaics. The giants represented on a mosaic from the grave of Cornelia Urbanilla recall similar depictions in Alexandria and Piazza Armerina. Until the beginning of the Christian era, Greco-Oriental influence is evident mainly in the basilicas, both forensic and Christian, which through Early Christian times follow the three-aisled East Greek type (see AFRICA, NORTH; AFRICAN-ROMAN ART; PHOENICIAN-PUNIC ART).

CONCLUSION: DIFFUSION OF MAGNA GRAECIAN AND SICILIAN ART. In the middle of the 5th century B.C. the newly mature art of Magna Graecia and Sicily gradually penetrated the Italian peninsula. In Rome and in northern Italy the strong influence of Etruscan art was a force antagonistic to this development, even though Etruscan iconographical forms are unthinkable without Greek art. The exact role of Spina and Pyrgoi, the two northernmost Greek colonies, has not yet been established. The spreading of West Greek art became more pronounced when Rome gained dominion over all Italy, in the 3d century. One of the main centers for the diffusion of West Greek art was Campania, where developments essential to later, Hellenized, Roman art occurred: for example, in coinage (which provides a particularly clear illustration of this process), in the spread of the cult of Dionysos, and in the architecture of bath buildings. The Hellenizing current that was so productive in Rome seems to have reached there via Naples, the Via Labicana, and Praeneste (mod. Palestrina). Praenestine mirrors and cists (V, PL. 50) are particularly close to West Greek forms, although it is still impossible to demonstrate on which school they were dependent. Praenestine drawings seems closer to Sicily, as does its terra-cotta sculpture: 5th-, 4th-, and 3d-century examples from Falerii (V, PLS. 47, 54), which are Latian rather than Etruscan, show close bonds with Syracusan terra-cotta sculpture. Understandably, when Rome occupied Campania, Lucania, and Apulia during the 4th and 3d centuries, artists and artisans of Magna Graecia left their native land to seek the greater opportunities for work in the new Roman provinces. The migration of artistic types, a process that can best be traced in the architectural terra-cottas, was of greater immediate effect, however, since an indefinite number of casts can be made from a single imported mold. An obvious example is the dissemination of the fanciful antefixes of Taras in Apulia and Campania.

The influence of Magna Graecia and Sicily also penetrated southern Gaul and Spain, especially after the ties of these regions with Phokaia, the parent city, deteriorated. This influence is particularly marked in architecture: the forms of sepulchral pilasters typical in Gaul through the Imperial age, Corinthian capitals that are related to Syracusan examples, and the unclassic, un-Roman execution of the reliefs of Saint-Rémy and Orange are all in a West Greek tradition. In the Tiberius cameo in Vienna, the spatial quality is so pronounced that the gem might safely be considered a Magna Graecian or Sicilian product.

It has already been seen that Magna Graecian — above all, Tarentine — influence spread to Kerkyra, and from there, along the Egnatian Way, reached the Balkans and southern Russia. Artistic relations with northern Africa flourished, mainly with Cyrene, and from the 3d century on, with Alexandria.

In general, the influence of West Greek art was stronger in central Italy and Rome than in Greece. The social, ethnic, religious, and spiritual factors which contributed to the formation of this art can all be accounted for, ultimately, by the differences between the Greek colonies in the west and their mother country: their different political and economic structure, the fertility of the land, the high standard of living reached in a short time, and the resulting feeling of exuberant pride, all contributed significantly to the creation of the art of Magna Graecia and Sicily. Because West Greek artists attached little importance to plasticity in sculpture, relief was favored over sculpture in the round, a situation the reverse of that in Greece. The characteristic features of the relief sculpture of Magna Graecia and Sicily are perspective foreshortening and spatial depth, and the consequent pictorial illusion. Extension into depth was also stressed in architecture, thereby developing a characteristic that was to play a decisive part in Roman art. No less important is the preference for typical features, above all in the human face, which undoubtedly gave West Greek art, especially in its Samnite and Campanian variations, a determining role in the development of portrait sculpture. In conclusion, it can be said without exaggeration that only through the mediation of the cities of Magna Graecia and Sicily did Greek art take root in the west.

**GREENLAND.** See DENMARK.

**GREUZE, JEAN B.** French genre and portrait painter (b. Tournus, Aug. 21, 1725; d. Paris, Mar. 21, 1805). Little is known of Greuze's early career. Between 1745 and 1750 he was in Lyons studying with the painter Grandon. About 1750 Greuze went to Paris, where he studied under Natoire at the Royal Academy. At the *Salon* of 1755 his picture of a father explaining the Bible to his children (Leningrad, The Hermitage) was an immediate success, and he continued to exhibit at the *Salons* until 1769. In that year, his *Septimius Severus Reproaching Caracalla*, painted in the hope that it would win him admission to the Academy as a history painter, was unfavorably received, and Greuze was accepted only as a painter of genre. After this disappointment, Greuze no longer exhibited at the *Salons*, but the popularity of his pictures, which he showed only at his studio, continued until the French Revolution. At the height of his *Salon* career, Greuze enjoyed the enthusiastic support of Diderot, who, in his *Salon* criticisms, extolled the painter's moralizing scenes. In such pictures as *Village Betrothal* (1761; Paris, Louvre) and *The Paralytic Cared for by His Children* (1763; Leningrad, The Hermitage), Diderot felt that painting had returned to its proper moral and didactic role. Greuze also produced many pictures of adolescent girls: *Young Girl Weeping over Her Dead Bird* (1765; Edinburgh, Nat. Gall. of Scotland); *Offering to Love* (1769; London, Wallace Coll.); *The Broken Pitcher* (engraved 1773; Paris, Louvre; V, PL. 415). The delicate flesh tones and soft coloring of these pictures reveal a more sensuous aspect of his art. The innocence of these young ladies often appears false or, at best, dubious, and the symbolism of the pictures is frequently suggestive.

Greuze was also a successful portraitist, at his best in the forceful portraits *Etienne Jeaurat* (1769; Paris, Louvre) and *The Engraver Wille* (1763; Paris, Mus. Jacquemart-André). Greuze's pictures entered the most prominent collections of Europe and were bought by Catherine II of Russia and by Mesdames de Pompadour and Du Barry. Engravings of his pictures, from which Greuze earned considerable sums, were much in vogue in bourgeois as well as in aristocratic circles. Greuze's popularity, however, failed to survive the severe neoclassicism introduced by J. L. David (q.v.). During the French Revolution and the Napoleonic era, Greuze was virtually forgotten; he died penniless. Although Greuze's young ladies may be frivolous, his genre subjects (VI, PL. 77) portray the virtues of Rousseau's natural man and reflect the growing importance of middle-class morality in prerevolutionary France. This is especially true of the related *Father's Curse* and *Prodigal Son* (both ca. 1765; Paris, Louvre), compositions that, with their indebtedness to Poussin, foreshadowed the neoclassicism of David.

John W. McCOUBREY

**GRIS, JUAN.** Spanish-born painter of the cubist movement. Born José Victoriano González in Madrid, Mar. 23, 1887, Gris turned to painting in 1904 after two years as an engineering student. In 1906 he went to Paris, settling in the famous Bateau Lavoir, where he met Picasso, Braque, Apollinaire, and others later attached to cubism. Until 1911 the graphic arts were his major preoccupation, and Gris published numerous drawings in various satirical journals, in a style akin to the waning Art Nouveau. He produced his first important oil paintings in 1911 and exhibited regularly with cubists from 1912 on. In the mutual interchanges natural to a group of artists, the major contribution of Gris was his early statement of the "synthetic" or later type of cubism in 1913. That same year he began annual summer trips to southern France, sometimes going to Beaulieu instead. Because of his Spanish citizenship, he was exempt from war service, but the disruptions of World War I kept him in poverty and necessitated the aid of his friends, including Gertrude Stein. His fortunes improved slightly after the war, though he never enjoyed financial ease. His first one-man show took place in 1919 in Paris, but the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

next year he suffered a long illness which cost him several months' work. From 1922 to 1924 he designed several ballet sets for Diaghilev, his only venture outside easel painting except for the occasional illustration of his friends' writings. His health deteriorated steadily after 1922 until he died of uremia at the age of forty, on May 11, 1927.

Chief among his many paintings are *Violin and Guitar* (1913; New York, Coll. Mr. and Mrs. Ralph F. Colin); *Fruit Bowl and Carafe* (1914; Otterlo, Netherlands, Rijksmus. Kröller-Müller); *The Violin* (1916; Basel, Kunstmus.); *The Sideboard* (1917; New York, Coll. Nelson A. Rockefeller); *Harlequin* (1919; Chicago, Coll. Mr. and Mrs. Morton G. Neumann); and *Canigou* (1921; Buffalo, N.Y., Albright-Knox Art Gall.). Although he frequently followed the lead of Picasso and Braque, especially in the early years of cubism, Gris was a seminal force in modern art. His penchant for crisply defined forms and exquisite geometry placed him in the tradition of Ingres and Seurat and, with his highly personal sense of color, led him toward a structure of architectonic clarity whose impress was widely felt, even by Braque and Picasso. His calculated approach to painting has denied Gris the popular fame of Picasso, but save for a rare canvas too coldly decorative, his painting is the epitome of that art which finds a union between the plastically sensual and the conceptual (IV, PLS. 78, 80; V, PL. 130).

Robert L. HERBERT

**GROPIUS, WALTER.** Architect (b. Berlin, May 18, 1883). Descendant of an old family originally from Brunswick which in the immediately preceding generations had produced painters and architects, Gropius studied architecture in Berlin and Munich from 1903 to 1907 without, however, obtaining his degree. From 1907 to 1910 he was chief assistant to the highly successful Peter Behrens (q.v.). This association encouraged his development as an innovator, a course that began in earnest when he entered practice for himself in Berlin in 1910. More than any other master, Gropius may be regarded as the unswerving protagonist of modern architectural concepts, which are based on affirmation of these original and basic principles: rejection of any a priori solutions and the attainment of results through a strict method that offers the possibility of observing facts and attacking problems in order to give them coherent life through expressive form. As he himself has said, his approach has been through "a new set of values." No architect of our times has had wider influence than Gropius, inasmuch as he has been able to weld his theories, his works, and his teaching into a constructive synthesis; and it is especially as a teacher that he has surpassed all others.

His thought is essentially an outgrowth of the ideas of William Morris (q.v.). The romantic socialism of Morris stressed the necessity for endowing the useful object with a new dignity, with respect both to the method of production and to the esthetic qualities of the finished article. Henri Van de Velde (q.v.) was dialectically opposed to Morris, for though he shared the latter's preoccupation with the esthetics of the utilitarian, he realized what Morris denied — the importance of industrial manufacture for the mass production of useful objects of high quality. Peter Behrens was the first to give effective impetus to the immense possibilities of an art wedded to industry, and Gropius was to develop his ideas far more intensively, achieving from the interrelation of art and industry a cultural unity that must be regarded as an essential characteristic of our age. This aspiration has motivated Gropius throughout his life, whenever he has had the opportunity to fuse in practice his creativity as an artist and his activity as a teacher.

Upon being demobilized in 1918, Gropius became director of the Grossherzogliche Sächsische Kunstgewerbeschule (Grand Ducal Saxon School of Applied Arts) and the Sächsische Hochschule für Bildende Kunst (Saxon Academy of Fine Arts) at Weimar. This position gave him an opportunity to investigate the methods of the Werkbund, the German organization established in 1907 in an attempt to reconcile the influences derived from Morris's Arts and Crafts movement with the undeniable realities of industry. Undoubtedly Gropius also profited from the experience of Van de Velde, who was an important participant in the great cultural ferment fostered by the patronage of the German nobility at the beginning of the century and had brought about at Weimar (though not without many difficulties) a renaissance of applied arts and architecture. Before the war Gropius had in fact participated in the controversies centering around the Werkbund and had contributed both ideas and works to the movement. In 1911, in collaboration with Adolf Meyer, he built the Fagus Works, a shoe-last factory at Alfeld an der Leine (V, PL. 103); in this building, the system of supports found expression in a specific idiom completely independent of influences from any traditional style. The dynamic principle of spatial continuity between exterior and interior was established by using techniques derived from industrial processes: large transparent surfaces were formed by a sheathing of plate glass alternating with slender metal strips. Two years later, following the same strict principles of design that led to a plastic mode of expression which arose from functional considerations, yet was as independent esthetically as if it had been a work of sculpture, Gropius designed a diesel locomotive for the Koenigsberg railway factory. Once more in collaboration with Meyer, he participated in the 1914 Werkbund Exhibition at Cologne with a machine workshop and an administration building. Here also, along with certain features reminiscent of earlier styles, the glass motif of the Fagus factory recurred. The exceptional plastic strength of the forms accentuated the space-time factor, the simultaneity that was to

Plan of the Bauhaus, Dessau.

become the cardinal principle of this style of architecture and influence the historical development of the modern movement.

In the postwar period, when the two Weimar schools were united at Dessau to form the Bauhaus (see EUROPEAN MODERN MOVEMENTS) and housed in a great new complex of buildings that included the school itself, residences for the masters, and other quarters (PL. 81; FIG. 176), Gropius achieved his masterpiece — its purpose perfectly expressed by the form into which the content was translated. The educational idea was implemented by the functioning organism, which achieved significance through its esthetic expression. The message of the teacher and that of the artist were effectively conveyed in a single entity and reinforced each other. At the Bauhaus, which Gropius

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

directed at Weimar from 1919 to 1925 and at Dessau from 1925 to 1928, could be found all the major themes of his work, embodying the most advanced ideas in German and European art during those years. In the words of Mies van der Rohe, "The Bauhaus . . . was an idea, and Gropius formulated this idea with great precision." As Giedion has stated, "the fundamental problem of the Bauhaus was to establish harmony between machine-made mass production and the eternal laws of materials." In this school the logical links of Gropius' reasoning formed a perfect chain; its object was to give validity to art within the context of modern economy and, correspondingly, to endow every facet of production with artistic value. Thus, the traditional class distinction between artisan and artist was dissolved in a unifying vision of "total art." Architects, technicians, painters, printmakers, and masters of very diverse temperaments sought under the guidance of Gropius to find a truer relationship between form and function, form and material, form and production methods. (The participation of Joseph Albers, László Moholy-Nagy, Herbert Bayer, Marcel Breuer, Wassily Kandinsky, Paul Klee, Lyonel Feininger, Oskar Schlemmer, Johannes Itten, Gerhard Marcks, Adolph Meyer, Georg Muche, and other notable artists and architects deserves particular mention.) In the atmosphere of the Bauhaus, it was because of Gropius' innate quality as a democratic man that work could be done in collaboration without relinquishing personal modes of expression. A typical example of Gropius' ability to translate every significant problem of cultural activity into architectonic terms was the *Totaltheater* conceived by the director Erwin Piscator, who at this time was contributing to the renaissance of the German theater. The aim of the *Totaltheater* was to fuse audience and actors, and thus to create a milieu in which the spectator would become a participant in the staged action.

Berlin, Interbau apartment house, plan of two typical floors.

Meanwhile there was growing political agitation against the Bauhaus on the part of reactionary groups, who regarded it as the prime focus of avant-garde art, soon to be denounced as "degenerate." In 1928 Gropius resigned as director of the school and resumed professional practice in Berlin. In the same year he was active in the founding of CIAM (Congrès Internationaux de l'Architecture Moderne), an organization that was to give substantial support to the doctrines and wider implications of modern architecture as a cultural force, again largely due to the collaboration of Gropius himself. His interest in architectural problems became centered increasingly on the spatial and social implications of city planning, and this growing interest found expression both in his writing and in important projects. Among his completed structures, the Siemensstadt housing development in Berlin, built in 1929 (PL. 82), is outstanding for its stylistic precision and the equilibrium of its masses. In 1934, feeling Nazi oppression weighing ever more heavily upon him, Gropius was forced to emigrate, under the pretext of attending an international theater conference in Rome. His first sojourn was in England, where in only three years his work exerted a powerful transforming influence upon English architecture (PL. 82). In 1937 he moved to the United States, which may be regarded as his second homeland. It is characteristic of Gropius' openmindedness that he was able to adapt quickly and willingly to American life, despite the understandable differences between American society and his European cultural background. Harvard University offered him the chair of architecture in its Graduate School of Design, which he accepted and occupied from 1938 to 1952. In 1946, led by his convictions about the value of collaborative activity ("teamwork"), he joined with a group of young men, including several of his former students, to form "The Architects Collaborative" (TAC). With this group he undertook ambitious projects, and in 1949–50 they built the Harvard University Graduate Center (PL. 84). Here the original Bauhaus ideal of unity among the arts was again promulgated, though with somewhat less striking results. Until this time Gropius, in spite of almost universal repute, had actually built relatively few works; in later years, however, he has come to be involved in a number of major projects worthy of his mettle: the Interbau building in Berlin (PL. 83; FIG. 177); the United States Embassy in Athens (FIGS. 177, 178); Boston Back Bay Center; the University of Baghdad; the great Buckow-Rudow urban development in Berlin; and several others.

Athens, United States Embassy, elevation.

Athens, United States Embassy, plan of ground floor (in collaboration with The Architects Collaborative, TAC).

Having laid the foundations of a freely ranging method of research opposed to all a priori concepts either of traditional "styles" or even of a supposed "modern style," Gropius applied his critical faculties to a continuous effort of solving problems and to objective analysis of various themes. Nonetheless, his precepts are somewhat difficult to follow, since from the dialectical standpoint a lexicon based on the immediate reconciliation of disparate works continually being produced is somewhat indeterminate. There is also something indeterminate in trying to fit new works into previously established patterns. Bad architecture or the architectural failures of avowed followers should never be imputed to great masters, for every liberating message obligates those who avail themselves of it to use it with a sense of responsibility. Still, there remains the inescapable fact that to grasp such essential truths requires great individual capacity, and true disciples must evidence self-knowledge and exercise self-discipline in setting proper limits to their own activities. If Gropius has denied the possibility of a "modern style," regarded as a fixed canon of formal elements, it follows that his disciples should not ape his mannerisms; rather, they must confront the architectural problem afresh each time and achieve formal solutions by discerning the implications of the specific situation, thereby developing their perceptive powers. The relation between quality and quantity, in the sense of an endeavor to *multiply* quality — a constant preoccupation of Gropius' lofty social thinking — should be one favorable

to resisting the pressures of cultural conditions within our society, a social body that (and not with respect to architecture alone) expends much of its energy in the effort to become a unified whole. The quantity–quality problem becomes increasingly difficult in proportion to the society's disinclination to submit to leveling processes based upon dogma, no matter how reasonable and well-intentioned.

PRINCIPAL WORKS. – 1906: Agricultural workers' houses, Janikow near Dramburg, Pomerania. – 1911: Fagus Works, Alfeld an der Leine (in collaboration with Adolf Meyer; V, PL. 103). – 1913–14: Housing development with 30 detached dwellings, Wittenberg (with A. Meyer); Semmering residence, near Vienna (project). – 1914: Werkbund Exhibition, Cologne, office building, garage, and workshops, Pavilion for Deutz Machine Factory (with A. Meyer). – 1922: Memorial in concrete, Weimar; Competition design for Chicago Tribune Building (with A. Meyer). – 1923–24: City Theater, Jena. – 1924: Friedrich Froebel Institute, Bad Liebenstein, Thuringia (project, with A. Meyer). – 1925: Bauhaus faculty quarters and Gropius residence, Dessau. – 1925–26: Bauhaus buildings, Dessau. – 1926–27: Toerten housing development, Dessau (Sections I–III); Werkbund Exhibition, Stuttgart, two dwellings. – 1927: *Totaltheater* (project). – 1927–28: Municipal employment office, Dessau; Dammerstock housing development, Karlsruhe (competition, first prize). – 1928: Toerten housing, Dessau (Section IV). – 1929: Gagfah housing on Lindenbaum, Frankfurt am Main. – 1929–30: Siemensstadt housing development, Berlin (PL. 82). – 1929–31: Research for apartment blocks for Reichs Research Institute for Economy in Building. – 1929–33: Chassis for Adler automobiles (VIII, PL. 45). – 1930: German Werkbund Exposition, Paris; Project for Ukrainian State Theater, Kharkov. – 1931: Project for Palace of the Soviets, Moscow. – 1934: Non-Ferrous Metals Exhibition, Berlin (with Joost Schmidt). – 1935–36: Works in England in collaboration with Maxwell Fry: Apartment house in park, St. Leonhard's Hill near Windsor (project); Levy house, Chelsea, London; Laboratories for London Film Production, Denham; Donaldson residence, Sussex, England; Impington College, Cambridgeshire; Histon School, Cambridgeshire. – 1937: Project for nursery school, Cambridge, Mass. – 1937–39: Works in collaboration with Marcel Breuer: Gropius house, Lincoln, Mass. (FIG. 179); Project for Wheaton College Arts Center; Breuer House, Lincoln, Mass.; Ford house, Lincoln, Mass.; Hagerty house, Cohasset, Mass.; Chamberlain house, Sudbury, Mass.; Pennsylvania pavilion, New York World's Fair. – 1939: Frank house, Pittsburgh, Pa. (PL. 82). – 1941: Suburban housing development, New Kensington, near Pittsburgh, Pa. (250 detached houses and an apartment building; with Marcel Breuer). – 1943–45: Prefabricated houses for "Packaged Housing System" and General Panel Corporation (with Kurt Wachsmann). – 1946: Established The Architects Collaborative (all works thereafter in collaboration with TAC unless otherwise noted): Ryan house, Cambridge, Mass.; Poppleton house, Dayton, Ohio. – 1947: Brockelman house, Worcester, Mass.; Neill house, Andover, Mass.; Wolfers house, Maine; Peter house, Cape Cod, Mass.; Catheron house, Foxboro, Mass. – 1947–52: 30 residences for Six Moon Hill, Lexington, Mass. – 1948: Project for Hua Tung University, Shanghai; Junior high school, Attleboro, Mass.; Lawrence house, Lexington, Mass.; McMahon house, Lexington, Mass.; House in Providence, R.I.; England house, Pittsfield, Mass. – 1949: Pillsbury house, Rumford, R.I.; Field house, Cape Cod, Mass. – 1949–50: Harvard University Graduate Center, Cambridge, Mass. (PL. 84; Brown, Lawford and Forbes, Technical

Lincoln, Massachusetts, Gropius house, plan of ground floor.

Associates). – 1950: Chandler Street Junior High School, Worcester, Mass. (with G. Adolph Johnson); Apthorp house, Concord, Mass.; Hechinger house, Washington, D.C.; England house, Washington, D.C.; Napoli house, Concord, Mass. – 1951: Trade school, Attleboro, Mass.; Burncoat Junior and Senior High School, Worcester, Mass. (with G. Adolph Johnson); Elementary school, Worcester, Mass. (with Albert Roy); Pillsbury house, Milton, Mass.; Vannah house, Foxboro, Mass.; Stichweh house, Hanover, Germany. – 1951–52: Houses at Five Fields, Lexington, Mass.; Houses (3) at Lake Barcroft, Falls Church, Va. – 1952: West Side Elementary School, Taunton, Mass.; Elementary schools (2), Warwick, R.I. (with Harkness and Geddes, Providence); Senior high school, Concord, N.H.; Office building for American Association for the Advancement of Science, Washington, D.C.; Hechinger Company stores, Alexandria and Falls Church, Va.; Cole house, Cambridge, Mass.; Baruch house, Newton, Mass.; Lang house, Newton, Mass.; Elementary school, Cambridge, Mass. (with Carl Koch); Elementary school, North Adams, Mass. – 1953: Wherry housing development, Quonset, R.I. (for the Navy); Project for Boston Back Bay Center (with Boston Center Architects). – 1954: Elementary school, Worcester, Mass. – 1955: Elementary school, Waltham, Mass.; Junior high school, South Attleboro, Mass.; Clinic for Chest Diseases, Boston. – 1956: Elementary school, West Bridgewater, Mass.; Defense housing, Otis Air Force Base, Falmouth, Mass. – 1957: High school, Littleton, Mass.; High school, Northfield, Mass.; Apartment house, Hansa housing development, Interbau Exhibition, Berlin (with TAC and Wils Ebert). – 1958: Junior high school, Needham, Mass.; Elementary school, Stoughton, Mass.; Dormitories (2), Phillips Academy, Andover, Mass.; Reyim Synagogue, Newton, Mass.; Murchison house, Provincetown, Mass. – 1959: Elementary school, Acton, Mass. – 1960: Buildings for Brandeis University, Waltham, Mass.; High school, Wayland, Mass.; Elementary school Lincoln Mass.; Elementary school, Kingston, Mass.; Elementary school, Waltham, Mass.; United States Embassy, Athens, Greece; Gould Hospital, Presque Isle, Maine; Blood Donors' Center, Children's Hospital, Boston. – Projected or under construction, 1961: University of Baghdad, Iraq; Buckow-Rudow housing development, West Berlin (with TAC and Benjamin Thompson); Shops for Sears, Roebuck & Company, Saugus, Mass.; Oheb Shalom Synagogue, Baltimore.

Ernesto N. ROGERS

WRITINGS BY THE ARCHITECT. "Selected Bibliography of Books and Articles Written by Walter Gropius" is included in J. M. Fitch, Walter Gropius, New York, 1960, pp. 120–21. Among Gropius' most important writings are: The New Architecture and the Bauhaus (trans. from German by P. Morton Shand), London, 1935, New York, 1936 (new ed., Boston, 1955): Bauhaus 1919–1928, ed. by Herbert Bayer, Walter Gropius, and Ise Gropius, New York, 1938 (2d ed., Boston, 1952); Scope of Total Architecture, ed. by Ise Gropius, New York and London, 1955. Also see: In Search of Better Architectural Education (in S. Giedion, ed., A Decade of Contemporary Architecture, New York, 1954, pp. 47–52); Architecture in Japan, Perspecta, no. 3, 1955, pp. 8–21, 79–80 (reprinted in W. Gropius, K. Tange, and Y. Ishimoto, Katsura: Tradition and Creation in Japanese Architecture, New Haven, 1960); Discourse at Inauguration of the School at Ulm, Domus, no. 315, 1956, pp. 1–4 (in Italian); Walter Gropius, Arch. Record, no. 232, March, 1956, pp. 190–96; The Architects Collaborative, Baukunst und Werkform, no. 12, 1957, pp. 683–702; Un opera di Gropius e TAC nelle preesistenze ambientali di Atene, Casabella Continuità, no. 220, 1958 (Speech delivered by Gropius at the Harvard Club of Boston on the occasion of his 75th birthday, May 24, 1958); Einheit in der Vielfalt — Ein Paradox der Kultur, Bauen und Wohnen, no. 12, 1959, pp. 409–17 (Eng. summary opposite p. 409).

In addition to these cited writings, there follows a statement written by Gropius specifically for the Encyclopedia of World Art:

Already as a schoolboy I was determined to become an architect. Creation and love of beauty appeared to me the basis of human happiness. Instinctively I revolted against the increasing ugliness of the modern urban environment, compared with the unity and beauty of old, preindustrial towns. Pondering how I, as an individual, could contribute to reharmonizing the prevailing chaos, I became more and more convinced that the usual practice of architects of relieving the dominant disjointed pattern by a beautiful building here and there is most inadequate, and that we must instead find a new set of values, based on those constituents which might engender an integrated expression of the thought and feeling of our time.

From this early, passionate concern grew the idea of the Bauhaus — my attempt at directing our creative efforts toward a new cultural unity as the visible expression of our modern, industrialized society, in which all parts would be interrelated within an organic whole. This idea of a cultural reintegration of our world became the obsession of my life. Spreading this idea by example and by word, finding new values of supraindividual validity, emphasizing the necessity of collaboration in order to broaden the effort — these became my intellectual tools of coordination. This meant first finding for myself an effective attitude to control the "you and I" relation, which is the basis of the social problem *in nucleo*; it meant, further attaining an identity of thinking by doing, by living what one preaches. Realization of the final goal of "total architecture," which would embrace our whole environment from a simple chair to a comprehensive city, called for incessant experimentation, seeking new truth in contact with like-minded artists; for it is a program of search, rather than research, that leads from observation to discovery, to invention, and finally to an intuitive shaping of our contemporary scene.

Such a conviction guided me into aspiring to a new space conception for my architectural work, away from the static wall enclosure toward a flowing spatial continuity in keeping with the dynamic trend of our period, which has introduced the dimension of time into works of art. I recognized that artistic creation draws its life from the mutual tension between the subconscious and the conscious faculties of human existence, that it fluctuates between reality and illusion, and that therefore the desirable correlation and interaction between various creative individuals can come only from within and cannot be imposed by precept or edict. A common visual language, as begun at the Bauhaus, influenced by both practical and psychological factors, provides a solid foundation for the spontaneous creation of art and architecture and establishes a common key for understanding their manifestations. It enables a collaborating team to synchronize individual efforts

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

and to raise its integrated work to higher potential than is represented merely by the sum of the work of just so many individuals.

I believe that such an approach, built upon a conception of totality with man as the measure, will lead to the reconciliation of the artist — the prototype of whole man — with the machine; it will reinstate him within our world of production, side by side with the scientist and the economist, as the natural authority to give beautiful form and meaning to our environment. The artist, by creating an organic setting for life, must give life a chance and an incentive to "manifest itself beautifully." This means that he cannot dissociate himself from the struggles and efforts toward social improvement with the excuse that this would dissipate his artistic strength and interfere with his real task: the creation of beauty. Beauty is an integral part of the way of life and does not arise in isolation. It cannot be attained surreptitiously, for it must have a solid foundation in the very habits of the people; and the architect is called upon to help form these habits.

Such a broadening of the artist's sphere of influence will be slowly effected by an education that will rediscover that beauty is a basic requirement of life, and that this recognition is a precondition for a true culture.

This, my creed, exemplified by my own architectural work and by my writings, has also guided my educational activities. Convinced of the common citizenship of all forms of creative work and their interdependence, I recognized that design is neither an intellectual nor a material affair, but simply an integral part of the stuff of life, necessary for everyone in a civilized society. So I tried to make young people realize how inexhaustible are the means of creation and stimulated them to find their own solutions. Banishing preconceived ideas of a "modern style," of formulas and dogmas, I gave them rather a method of approach that would allow them to tackle each problem according to its own peculiar conditions. By encouraging them to supplement the Platonic experience at the drawing board with practical experiences in the field and the factory, I wanted them to bridge the prevalent fatal separation of the design of buildings from their execution, and to accept the machine as the modern vehicle of form to fulfill human and social requirements. The aim of such an architectural education is not the specialist but the man of vision who can humanize our life by integrating emotional demands with our new knowledge of man and our new scientific discoveries — he who would be able to achieve in his work a new unity of order and spirit, visibly expressed in space and volume.

Walter GROPIUS

**GROS,** BARON A. J. French painter (b. Paris, Mar. 16, 1771; d. Paris, June 26, 1835). The son of a painter, Antoine Jean Gros entered J. L. David's studio in 1785 and the Académie de Peinture in 1787. In 1792 he submitted his painting *Antiochus and Eleazar* for the Prix de Rome but failed to win. In 1793, with the dissolution of the Académie after the French Revolution, Gros left for Italy. At Genoa, in 1796, he met Josephine Bonaparte, who introduced him to Napoleonic society. Thereafter he was to be the chief painter of Napoleonic military history and actually accompanied the general during his north Italian campaigns (*Bonaparte at Arcola*, 1796, Versailles). In the decade following his return to Paris in 1800, Gros exhibited at the *Salon* his major records of Napoleonic events, dramatizing deeds of prowess and benevolence (*Pesthouse at Jaffa*, 1804, Louvre; *Battle of Aboukir*, 1806, Versailles; *Napoleon at Eylau*, 1808, Louvre). After the fall of Napoleon, Gros continued to paint for the restored monarchy, executing subjects sympathetic to the royalist viewpoint (*Louis XVIII Leaving the Tuileries*, 1817, Versailles; *Embarkation of the Duchess of Angoulême*, 1819, Bordeaux, Mus. B. A.). He took over David's studio after his master's exile in 1816. In 1814 he began to decorate the dome of the Panthéon with themes from French history, and upon its completion in 1824 he received a baronage from Charles X. After David's death in 1825, Gros felt increasingly obliged to uphold his teacher's classical heritage, although his own work had served to weaken that tradition. Accordingly, his later life was marked by artistic as well as personal conflicts; and in 1835, the year he was elected professor at the Académie, his body was found in the Seine, presumably a suicide.

Of David's many students, Gros was the most important in undermining the classical doctrine. As pictorial propaganda for Napoleon, his most powerful canvases depicted contemporary, not antique, actualities and, as such, promoted in France that documentary recording of modern history which in England had been initiated primarily by West and Copley. In describing with journalistic vividness and presumed accuracy the exotic locales, the emotional drama, and the often gruesome horrors of the Napoleonic campaigns, Gros helped to establish the tenets of French romantic painting; and in style, as well, his penchant for Rubens' fluid paint techniques, sensuous color, and dynamic structure foreshadowed Géricault and Delacroix. Gros also painted subjects from ancient, Biblical, and medieval history, generally choosing themes of a passionate nature, and he was a first-rate portraitist, especially gifted in seizing a mood of psychological intimacy.

Robert ROSENBLUM

**GROTESQUE.** See MONSTROUS AND IMAGINARY SUBJECTS.

**GRÜNEWALD,** MATTHIAS. German painter, who died in Halle in 1528. He signed himself Mathis on a drawing of a woman in the Ashmolean Museum in Oxford, and it is by this name alone, or by some variant of it (Mathes, Mathias, etc.), that he is referred to in most of the sources. Zülch (1938) discovered his birthplace, Würzburg, and the surnames Nithardt (Neithardt) and Gothardt — which second form, conceivably a transformation of the first, may have been adopted by the artist himself, as the rare signature MG N (Mathis Gothardt Nithardt) seems to indicate. As for the appellation "Grünewald," retained here for convenience, it was bestowed on him by Joachim von Sandrart (1675), on erroneous grounds apparently, for no source confirms it.

Opinions differ on the artist's date of birth. Naumann (1930), least plausibly, places it in 1455; Zülch, about 1460; Feurstein (1930), between 1475 and 1480; Weixlgärtner (1949), about 1480; Schmid, whose work of 1911 provides the foundation for all subsequent studies on Grünewald, about 1483. Zülch identifies the painter with a Mathis active in Aschaffenburg from about 1480 to 1490. Zülch's chronology as well as Fraundorfer's more recent one (1952) contain an unbridgeable gap extending beyond 1500.

In the various attempts to fix Grünewald's date of birth, the *Portrait of a Young Artist*, also known as the *Youthful Self-portrait* (Chicago, Art. Inst.), has generally been taken into consideration. It is a picture of a youth about fifteen years old, which Feurstein convincingly dates about 1495. It bears the initials MN (Mathis Nithardt). Buchner (1953), while conceding that the painting might be by Grünewald, does not believe that it is a self-portrait. Its place of origin, according to him, is Augsburg; according to others, a city of the middle Rhine. Indubitably the painting is close to the work of Master WB, probably resident in Mainz, especially that artist's *Portrait of a Man* of 1487. As Stange writes (1955), a direct path seems to lead from Master WB to Grünewald, linking these two figures strangely isolated in the scene of contemporary painting.

The latter part of Grünewald's life is somewhat better documented than his early years, even though few of the documents uncovered can be unequivocally construed as applying to him. The data gathered by Fraundorfer tend to support A. Schädler's view that the frequently mentioned "Master Mathis, the woodcarver of Seligenstadt" is not identifiable with the painter (*MJhb*, XIII, 1962). On the other hand, the Mathis mentioned Oct. 10, 1505, can with probability be identified with him. A comparatively rich source of information is the file on a long-drawn-out lawsuit containing many references

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

to the artist; for example, one of June 9, 1511, describing him as "Master Mathes, painter and stonecutter of the castle of Aschaffenburg," and one of Oct. 4, 1514, pointing to his residence, presumably of some duration, in Aschaffenburg, the second city of the Electors after Mainz. The records of this file disclose that he was attached to the court of the Archbishop-Elector of Mainz, Uriel of Gemmingen, not only as painter but as superintendent of works and architect. Later he was court painter of Uriel's successor, Archbishop (then Cardinal) Albrecht of Brandenburg. Grünewald's last years were shadowed by the Peasants' War and the Reformation, which strongly opposed church art. In all likelihood dismissed as court painter in 1526, he moved to Frankfurt am Main, where he was employed as a waterworks specialist (as early as 1510 and 1517 he is documented as an expert on fountains) and mill builder; he was similarly employed in Magdeburg and Halle. His death in Halle in the last days of August, 1528, is attested by a document of Sept. 1 of that year. In 1531 Melanchthon mentions him, together with Dürer and Cranach, as a well-known artist of this time; then his name falls into oblivion.

What schools and artists influenced Grünewald remains problematic. In the 1490s he may well have entered on the guild-prescribed period of wanderings, perhaps visiting Italy for the jubilee year of 1500. One of his chief goals, then, would have been Nürnberg, the home of Dürer, whose influence is especially apparent in the pleated garments of the Donaueschingen panels. Grünewald's works are testimony to a lasting fascination with the *Revelations* of St. Bridget of Sweden, printed in Nürnberg in 1502 by Dürer's godfather, Koberger (Feurstein).

WORKS. *a. Paintings*: *Portrait of a Young Artist*. See above. – *Triptych of Lindenhardt* (1503; on pine; parish church of Lindenhardt, near Bayreuth). This work, probably commissioned from Grünewald in Nürnberg, was donated by the community of Bindlach to neighboring Lindenhardt in 1685, after that town was devastated by fire. The panels were recognized as Grünewald's work by Sitzmann in 1915 (pub. 1919, 1924, 1926); the attribution, disputed by some scholars, was accepted by Dörnhöffer, Friedländer, Schmid, Feurstein, and others. In 1928 the panels were exhibited in Nürnberg as the artist's earliest work. They were sensitively restored in 1926 and again in 1955 (Zülch, 1938; Meier, 1957). The three panels back a carved triptych. The central one presents the Man of Sorrows with the instruments of the Passion. Christ's right arm recalls the sketch in the *Portrait of a Young Artist*. When the altarpiece is closed, the two wings appear as a single composition, with the 14 helpers in need (*Nothelfer*), led by St. George and Bishop Dionysius. Not aligned schematically, the 14 figures form a mass apparently confused but actually oriented by St. George's banner, which seems to point the way to suffering humanity. The relatively few and sober colors are employed in many gradations. The draperies have a certain Gothic quality; their chiaroscuro shading suggests a sojourn in Italy. – *Mocking of Christ* (on pine; Munich, Alte Pin.). This painting, a memorial to a person who died in December, 1503, can hardly be earlier than 1504. Its provenance, according to some, is the Carmelite church in Frankfurt; according to others, Aschaffenburg. Braune identified it in 1909 as Grünewald's work. The composition is more dramatic, the palette richer, than in the preceding work. Joseph of Arimathea (?) with a follower is shown interceding with one of a group of ruffians bent on belaboring the seated, blindfolded Saviour. – *Crucifixion* (ca. 1505; on linden; Basel, Öffentl. Kunstsammlung; PL. 94). This panel, mentioned in Basel since 1775, shows, at the left of the Cross, the Virgin wrapped in a dark-blue cloak, Martha, and the Magdalen; at the right, St. John the Evangelist in a waving brick-red garment and Longinus. Gethsemane and a receding crowd are barely distinguishable on the night-darkened horizon. – *Small Crucifixion* (ca. 1506–08; on linden; since 1940 in Washington, D.C., Nat. Gall.). It belonged to William V of Bavaria, who in 1605 had it engraved on copper by Raphael Sadeler. Sandrart identified it as Grünewald's work in the mid-17th century. It was widely imitated. In the possession of Schöne of Essen, it was rediscovered in 1922 and published by Friedländer and Schoenberger (both, 1922); it then passed to the Koenigs Collection of Haarlem. On the left of the crucified Christ, livid against the nocturnal darkness, are the Virgin, upright, and the kneeling Magdalen; St. John stands on the right, his hands clasped together. Zülch (1938), moved to the same analogy as Huysmans before the *Crucifixion* of Karlsruhe, compares to a drawn crossbow the cross with its horizontal beam strained downward by the outstretched arms of Christ. – *Portrait of a Clergyman* (on linden; initialed MG or GM; Munich, Alte Pin.). Attributed to Grünewald by Buchner (1957), who adduces its similarity to *The Meeting of St. Erasmus and St. Maurice* (PL. 90) in the psychologically revealing presentation and the asymmetry of the features. – *St. Lawrence* and *St. Cyriacus* (ca. 1510; grisaille on pine; Frankfurt, Städelsches Kunstinstitut). These two panels, together with the two described below, constituted the fixed wings of an altarpiece donated by Jacob Heller to the Dominican church of Frankfurt. The central panel, painted by Dürer in 1509, was acquired by Maximilian of Bavaria in 1615 and was destroyed when the Munich Residenz burned in 1674. The monogram MG N at the bottom of the St. Lawrence panel is not original. St. Lawrence is shown with a folio volume in his left hand; in his right is the gridiron, over which the lower portion of the dalmatic falls with almost baroque fullness. Cyriacus, who according to legend healed the possessed daughter of Diocletian, Artemia, gently forces open her mouth, that the evil spirit may escape; in his left hand he holds a book of exorcisms. The tuliplike clasp on his breast recalls St. Barbara's crown in the Lindenhardt altarpiece. – *St. Elizabeth* and *St. Lucy* (?) (ca. 1510; grisaille on pine; Donaueschingen, Fürstlich Fürstenbergische Samml.; PL. 93). The two panels, together with those described above, were part of the Heller altarpiece. They were recognized by J. Wilhelm and I. Geissler as Grünewald's, and they became part of the Donaueschingen Collection in 1951 (Salm, 1951). Like the gentlewomen of Nürnberg in Dürer's drawing, the saints wear richly draped garments, whose swelling folds and silken pleats, though rendered in monochrome, have the highest painterly quality. The reverse sides show Jachin and Boaz, the pillars of the Temple of Solomon, a theme to which the artist was to return at Isenheim.

*Isenheim Altarpiece* (on linden; Colmar, Mus. d'Unterlinden; PLS. 85–89, 91, 92). Grünewald's masterpiece, executed for the church of the monastery belonging to the hospital order of St. Anthony at Isenheim, was probably painted between 1512 and 1515; the figure 1515 on the Magdalen's ointment jar must be the date of completion. The altarpiece measures about 10 ft. closed, about 21 ft. open. It consists of a carved wooden shrine with three pairs of wings (i.e., three wings, one behind the other, on each side); one pair is fixed, the other two are movable and capable of closing on the shrine like the leaves of a cupboard. Underneath is a carved predella, also closable by a pair of wings. Besides the carved work, there are nine painted scenes (numbered here for easier reference). The outer movable wings, when closed, present the Crucifixion (1; PL. 88). The closed wings of the predella present the Lamentation (2). The fixed wings, exposed when the movable wings are closed, show St. Anthony (3) on the left and St. Sebastian (4; PL. 87) on the right. When the outer movable wings are opened the Annunciation (5; PL. 89) appears on the left, "Christmas" (6) in the center, and the Resurrection (7; PL. 89) on the right. Once the inner movable wings are opened, the carved shrine (8) is revealed, with the Temptation of St. Anthony (9; IV, PL. 180) on the right and his meeting with St. Paul (10) on the left. (1) In the Crucifixion (PL. 88) the Cross is off center, just to the right of the line of juncture of the wings. Christ's over-life-size body is covered with wounds from his scourging; his head crowned with thorns sinks sideways on his breast, whose labored movement has but shortly ceased; his mouth is held open; a watery blood runs from the wound in his side (PL. 86). The crowd has withdrawn; a sense of solitude and desolation pervades the scene. The few figures, painted in light colors and on different scales, are projected against the murky landscape with an effect at once ghostly and strident. From the anguish-frozen group of Mary and John and the kneeling, hand-wringing Magdalen, there seems to issue but a single lament, directed to the martyred head of Christ (PL. 85). To the right stands the Baptist (PL. 86), his finger pointing at Christ, in allusion to the fulfillment of the prophecy: "He must increase, but I must decrease." (John 3:30). (2) In the scene of the Lamentation (PL. 92), frigid in coloring, a wide landscape spreads beyond the empty sarcophagus. (3–4) The fixed wings with the patron saints of the hospital — Anthony the Hermit and Sebastian, protector against the plague (PL. 87), posed on plinths ornamented with stone-gray foliage — may have been interchanged when they were joined to the central panel in the present century. According to Sarwey (1955), reversing their position would make for a more balanced ensemble, for the pathetic scene of Golgotha would then be framed by Jachin, luminous pillar of life, and Boaz, pillar of the shadow of death. Other considerations favor an originally reversed order: the Cross would occupy the exact center between the two pillars; the windows, shifted toward the exterior, would be less obtrusive; a better equilibrium of the masses would be obtained, as well as a more harmonious distribution of colors, with the reds of the wings gradually shaded down as the eye moves outward. A final point: the pillar of light, Jachin, is traditionally placed on the left. As early as the end of the 19th century the extraordinarily expressive head of St. Sebastian was taken to be a self-portrait (Rieffel, 1897). The age seems to fit, for the saint looks as old as the artist must have been when he painted the *Isenheim Altarpiece* — about

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

forty. The striking resemblance between this head and the *Portrait of a Young Artist* contributed to the identification of that painting. (5) In the Annunciation (PL. 89) — a joyously colorful scene vibrant with light, suggestive of morning — the angel Gabriel, in fluttering red and gold garments, appears before the Virgin, who is overcome with astonishment and fright. (6) The Christmas panel, purely symbolic, even to the choice of colors, seems greatly indebted to the visions described by St. Bridget in the *Revelations* (Feurstein, 1930). The left half, with the Angel Concert, is nearly filled by what can be interpreted as a forehall to the Temple, a kind of late Gothic porch lavishly adorned with sculpture, which Sittler (1957) derives from the rood screen of the Cathedral of Breisach. It shelters music-making angels; on the tympanum, according to Sittler, God the Father hands Abraham the ring of the New Covenant. The Virgin in a glowing yellow and red aureole kneels on the threshold. The right half of the composition, with the Nativity, is dominated by the Virgin, dressed in carmine and blue-green, and the Child (PL. 91). Near them are the symbols of virginity — the walled garden, or *hortus conclusus*, the rosebush, the crystal decanter — as well as various appurtenances of infancy — the bathing tub, the cradle, linens. A radiant landscape of crystalline mountains rises in the background. From the throne of God, high in the heavens, there descend in beams of light diaphanous angels and the seraph bearing the diadem of immortality. (7) In the Resurrection (PL. 89) the Saviour rises into the starry firmament in a blinding rainbow-colored aureole, as the guards, bathed in bright light, tumble to the ground. By the boldest transitions the colors pass from ice green to violet, to dark red, to golden yellow. (8) The shrine, carved by Nikolaus of Hagenau, presents, in the middle, St. Anthony; above, the symbols of the Evangelists; to the left, St. Augustine with the donor Johannes de Orliaco (Jean d'Orliac); to the right, St. Jerome with the lion. The reliefs of the predella, representing Christ and the apostles, are by Desiderius Beichel (Beychel), whose signature is on the back of the group with St. Thomas. (9) The Temptation of St. Anthony (IV, PL. 180), most inventive in its ferocious swarm of demons, was intended to remind the patients of the hospital that even their mighty patron saint was not secure from the snares of the devil. A sign at the lower right bears the lament of the incurable· "Ubi eras Ihesu bone ubi eras quare non effuisti ut sanares vulnera mea" ("Where were you, good Jesus, where were you? Why did you not come to heal my wounds?"). (10) St. Anthony's visit to St. Paul takes place in a delightful landscape, almost romantic in feeling. St. Anthony wears the features of Guido Guersi, the preceptor of the monastery, whose coat of arms is propped against the rock on which the saint is sitting. Curious to note, the ground is strewn with 14 types of herbs for the cure of St. Anthony's fire (Kühn, 1948).

*Virgin of Stuppach* (on canvas, transferred to a new wooden panel; parish church of Stuppach, near Bad Mergentheim, Württemberg), central panel of an altarpiece dedicated to the Virgin of the Snow, originally in the Collegiate Church of Aschaffenburg. The frame of the altarpiece, still in that church, bears the artist's monogram, the date of completion, 1519, and the names of the donors, Heinrich Reitzmann and Caspar Schantz. Several times restored, the painting of the Virgin and Child under a rainbow was identified as Grünewald's work by Schmid (1911); its literary source, according to Feurstein (1930), is St. Bridget's *Revelations*. Of the two wings, only one survives: the *Miracle of the Snow*, in Freiburg im Breisgau (Augustinermus.). This painting, whose subject is the miraculous snowfall that helped determine the site of S. Maria Maggiore in Rome, was attributed to Grünewald by Bayersdorfer in 1897. – *The Meeting of St. Erasmus and St. Maurice* (on pine; Munich, Alte Pin.; PL. 90). Commissioned by Cardinal Albrecht of Brandenburg for the Collegiate Church of St. Moritz in Halle and brought by him to Aschaffenburg to protect it from the upheavals of the Reformation; transferred to Munich in 1836. The subject is a colloquy between Bishop Erasmus, in episcopal vestments, accompanied by a bare-headed canon, and St. Maurice, in silver armor, followed by a dark-skinned archer. The choice of Erasmus, who wears the features of Albrecht, was probably a bow to Erasmus of Rotterdam. – *Crucifixion* (PL. 95) and *Christ Carrying the Cross* (PL. 94; on pine, Karlsruhe, Staat. Kunsthalle). These paintings, datable to the period of the Peasants' War, formed the obverse and reverse of a turnable panel in the parish church of Tauberbischofsheim, demolished in 1664. H. Thoma in 1873 recognized the artistic value of the *Crucifixion*; it was attributed to Grünewald by O. Eusenmann of Kassel. The *Christ Carrying the Cross* was discovered in 1883, when the panel was cleaned; the two paintings were subsequently separated. There are certain similarities between this Crucifixion and that of Basel, done about twenty years earlier (e.g., in the cloaks of St. John). The later painting, limited to three figures, has a tragic force that distinguishes it as one of Grünewald's greatest achievements. It inspired Huysmans' deeply felt and widely cited description from *Là Bas* (1891), in which he likens the bent transverse beam of the cross to a bow about to spring back in sheer pity to hurl the suffering flesh to heaven. – *Lamentation* (on pine; Aschaffenburg, Collegiate Church), predella of a lost altarpiece, showing the arms of Albrecht of Brandenburg and Dietrich of Erbach.

*b. Some lost works*: *Lament of the Magdalen*. A copy on canvas is in Donaueschingen (Fürstlich Fürstenbergische Samml.), painted by Christoph Krafft in 1648 (Feurstein, 1924, 1930). It bears the arms of Abbot Franz Chullot of Sankt Blasien, in the Black Forest. In the middle is the crucified Christ seen in profile; on the right a ladder is propped against the cross; on the left is the kneeling Magdalen, crying out in despair. – Sandrart reported that three Grünewald altarpieces from the Cathedral of Mainz were removed by the Swedes and lost in a shipwreck in the Baltic. He also mentioned a life-size St. John the Evangelist at Castelgandolfo, in the possession of Pope Urban VIII.

*c. Drawings*. These are studies for paintings; in chalk, generally on brownish paper, occasionally heightened in white (numbering follows Meier, 1957; see also Behling, 1955). (1) Christ on the Cross (Karlsruhe, Staat. Kunsthalle). Damaged in part, but can be reconstituted by means of a copy in Basel (Öffentl. Kunstsammlung). Datable after 1503. – (2–5) Inserted in a Luther Bible of 1541, printed in Wittenberg, Stengel (1952) found studies of St. John the Evangelist (?) and two prophets, one of them Moses (all three, Berlin, Märkisches Mus.). They belong to the same group as the so-called "Mocking Pharisee" (Berlin, Kupferstichkabinett). – (6–7) The apostles Peter and James the Greater (formerly Dresden, Kupferstichkabinett), studies for a Transfiguration. – (8) Drapery study for a seated figure, belonging to the same group as nos. 6 and 7 (formerly London, Oppenheimer Coll.; now U.S., private coll.). – (9–21) Group of studies for the *Isenheim Altarpiece*; (9) Study for the Virgin of the Annunciation (Berlin, Kupferstichkabinett). (10) Portrait of an old man, perhaps Guido Guersi (Weimar, Schlossmus.). (11–12) Probably studies for the Biblical Marys (formerly Lützschena, near Leipzig, Speck von Sternburg Coll.). (13) Probably study for a Magdalen (Winterthur, Oskar Reinhart Coll.; PL. 96). (14) Woman with a veil on her head (Oxford, Ashmolean Mus.). Bears the signature [M]athis and later annotations. (15) Forearm of St. Sebastian (formerly Dresden, Kupferstichkabinett). (16) Upper arm of St. Sebastian (formerly Berlin, Kupferstichkabinett). (17) Seated old man, verso of no. 15. (18) Seated old man, verso of no. 16, study for the St. Anthony of the panel, showing him with St. Paul. (19) Head of a woman (Paris, Louvre). (20) Presumed self-portrait, with the monogram G within M; retraced in the 17th century by another hand, in pen and India ink (Erlangen, Universitätsbibliothek). An early-17th century copy is preserved in Kassel. (21) Study for the Virgin of the Annunciation (Berlin, Kupferstichkabinett). – (22) Nude trumpet player (formerly Haarlem, Koenigs Coll.). – (23–24) Unfinished drawing of St. Peter; on the reverse, St. Joseph, standing, with staff and sword (Vienna, Albertina). – (25) Kneeling king (?), the train of whose cloak is carried by angels; suggestion of a landscape (Berlin, Kupferstichkabinett). – (26) Half-length Virgin with Child and the infant St. John, verso of no. 25. – (27) Study for the *Virgin of Stuppach* (Berlin, Kupferstichkabinett). – (28) Head of a woman (Berlin, Kupferstichkabinett). – (29–34) Studies for the lost altarpieces of Mainz (except for no. 34, all Berlin, Kupferstichkabinett): (29) head of a screaming figure, verso of no. 28; (30) boy crying out; (31) standing woman and, on the reverse (32), St. Catherine; (33) St. Dorothy with a child on an astrolabe beside her; (34) study for a Queen of Heaven among clouds over a yellow-tinted moon, with the notation "Menz" (dialectal for Mainz; ca. 1520; Vierhouten, Van Beuningen Coll.; formerly Haarlem, Koenigs Coll.). – (35) Three-headed creature (ca. 1525; original monogram: G within M; Berlin, Kupferstichkabinett). According to Markert's somewhat forced interpretation (1943), a "Trias Romana" or personification of the vices of Rome; more likely, an "Unholy Trinity," a trinity of the devil (Winkler, 1952), or the "grimace of the triune god" (Liefmann, 1912). – (36) Study for the St. John of the Karlsruhe *Crucifixion* (Berlin, Kupferstichkabinett). – (37) Portrait of a canon (Stockholm, Nationalmus.). – (38) Portrait of Margaret Prellwitz, mother of Hans Schenitz (ca. 1525; Paris, Louvre). – (39) Virgin of Mercy (Stockholm, Nationalmus.), published by Schilling (1935). According to Winkler (1952), this is Grünewald's only pen drawing.

Six drawings (ca. 1525; Marburg, private coll.), heavily damaged by humidity, were found in 1949 at Gisselberg near Marburg. The harsh feminine types, a'so present in the unquestionably original panels of Donaueschingen, speak for their authenticity, which is vigorously defended by Winkler (1952) but still disputed. The subjects are God the Father; Mary on a throne of clouds with two angels; the Magdalen; Veronica; John the Baptist; and St. Paul. Of two further drawings, dealing, according to Winkler, with Christ and the Holy Ghost, there survive only fragments.

ESTIMATES AND INTERPRETATIONS (16th–20th cent.). Contemporaneous testimony on Grünewald is extremely sparse — so sparse that adequate data for an understanding of his esthetic and culture in relation to his environment can hardly be deduced from it. But this silence should not suggest that his fame is a product of modern criticism; even less that he was a special phenomenon, insulated from manifestations of the Renaissance in Europe and particularly in Germany. The documents present Grünewald as a court painter charged with important commissions; as an architect (he designed a chimney piece, supplying the model); and as a hydraulic expert, especially on fountains and mills. His adopted son was to pursue a Humanistic career. A little after the painter's death, Melanchthon, in the last chapter of his *Elementorum rhetorices libri duo* of 1531, ranked him just after Dürer and before Cranach — this order corresponding to the three levels of rhetoric (high, medium, and low), which he felt were illustrated by these artists. Grünewald, then, was the painter who followed the middle path ("quasi mediocritatem servabat"), who, unfolding dramatic themes, approached the sublime until he almost identified himself with it (indeed, "the middle level can scarcely be distinguished from the high"), but without giving his forms a classicizing idealization. This was a highly positive judgment and notably revealing, also shedding light on the valuation of Cranach about 1530. Moreover, since both Dürer and Cranach are known to have had close connections with Melanchthon (with consequences for their style and iconography still to be clarified), it is possible that Melanchthon's opinion of Grünewald, too, reflects a personal contact not yet investigated. It must be remembered that Grünewald lived and worked in great cultural centers such as Isenheim, which flourished under the Italian Maecenas Guido Guersi, and the court of Albrecht of Brandenburg, an extremely complex and interesting personality, whose patronage was both politically and religiously motivated, and who from more than one point of view may be regarded as a figure of the pre-Reformation.

There can be little doubt that Grünewald was involved in the religious and social conflicts of his time. An inventory of his estate lists a sealed box with Lutheran works and a booklet containing the "12 articles of the Christian faith" — most likely the "peasant articles" drawn up in Swabia, which called for free choice of pastors, abolition of slavery and of small tithes, the right to hunt, fish, and cut wood, and so forth. It is reported that in 1525, in Guebwiller, a Mathis Nithardt was stirring up the populace (this "wicked good-for-nothing. . . took some peasants with him and brought them into a cellar"). The coincidence in name might be written off as fortuitous — as it is, indeed, by most historians — were it not known that many artists, especially in southern German-speaking countries, participated in the religious and political struggles. Various persons with whom Grünewald must have had contact took part in the peasant revolt and were ultimately imprisoned. One may speculate whether a religious crisis prompted him to change the name Nithardt, suggesting wickedness, to Gothardt, suggesting godliness. (The similarity in meaning between *Nithardt*, a spiteful, ill-natured person, and *grün, grien*, "ill-humored," "sullen," may account for Sandrart's associating the master, in a manner historically erroneous but critically interesting, with Baldung-Grien, also miscalled "Grünewald.")

Grünewald, like other painters, may have been deliberately neglected by contemporary writers, for political reasons, although it would seem that after a period of exile in Frankfurt he was reconciled with Albrecht of Brandenburg. For a long time the German courts continued to interest themselves — predominantly as collectors — in the works of the master. In 1539 a nephew of Albrecht tried to acquire the Heller altarpiece in Frankfurt. Rudolph II in 1597 made a futile attempt to obtain the *Isenheim Altarpiece* (as did Maximilian of Bavaria some sixty years later) and the Heller altarpiece, though he did not know the author. In 1613 William V of Bavaria succeeded in obtaining the *Mocking of Christ*. The name of the painter was still cited in 1573 in Jobin's introduction to the *Accuratae effigies pontificum* by Onuphrius Panvinius, published in Strasbourg, and in 1619 by Vincent Steinmeyer (*Newe Künstliche Wohlgerissene vnnd in Holtz geschnittene Figuren*); but these citations are no more than mentions.

The strange art and iconography of the master must have aroused expressions of disapproval and puzzlement. How else explain why two painters active in Isenheim in 1578, Hagerich of Chur and Abel Stimmer (Stymer), should defy the incomprehension of the public, qualifying Grünewald's art as divine, denying anyone who did not understand it the right to judge it, and insisting, perhaps more than the rhetorical tropes of the time required, on the sacredness of the painter's inspiration and on the edifying value of his work. Hagerich of Chur, for example, writes: "This art comes from the grace of God / When God denies, then all's for naught / All should praise this work God wrought / For this art comes from God." Another painter, Philipp Uffenbach, jealously preserved and imitated the drawings of Grünewald. It is through these drawings that Grünewald's first biographer, Sandrart, came to know him.

Sandrart's biography (1675), although it is not based on written sources, seems to sum up the value judgments implicit in the preceding citations. He speaks of a "subtle spirit," of a melancholy temperament, of a solitary and unhappy life, thus drawing a "saturnine portrait" similar to those of the early Florentine mannerists, whose most extreme religious paintings are contemporaneous with those of the German painter. Sandrart emphasizes the naturalistic element in Grünewald's work, insistently speaking of realism, not alone in the biography proper but elsewhere; and he considers the master unrivaled in "truth." For this idea of realism it may be appropriate to recall the dramatic inflection, in a certain sense preexpressionistic, in the early Caravaggio style; Sandrart's thought presumably takes its impulse from his knowledge of this style. At all events he grasps the connection between the exaggeration, the imaginative transfiguration, of naturalistic impression — later exalted by the critics of expressionism — and the painstaking, almost polemic, depiction of sacred figures and their surroundings as poverty-ridden. A contemporary of Sandrart's, the traveler Balthasar de Monconys, on Jan. 5, 1664, refers somewhat uncertainly to Grünewald, describing him as far more esteemed than Dürer ("un Martin d'Achafenbourg, bien plus estimé infiniment qu'Albert Dure"). The period was that of the expansion of the baroque in Europe, and the appreciation of Grünewald was undoubtedly due to the force and drama of his compositions, to which French and Flemings were particularly susceptible in those years.

A new wave of enthusiasm for the artist, and especially for the *Isenheim Altarpiece*, which, partly because of its accessibility, was to remain the focus of interest, came in the second half of the 18th century, a time of warm appraisals by artists and critics, coupled, to be sure, with false attributions to Dürer. In 1828 Grünewald's masterpiece was visited by the most famous German artists, among whom was probably Peter Cornelius. The "Raphaelists" Tieck and Wackenroder, however, judged the work repellent. Mannerism, baroque, preromanticism, romanticism — each movement has left its own characteristic marks of appreciation, but it fell to the expressionists (anticipated by the 19th-cent. symbolists) really to discover Mathis Nithardt — still commonly called "Grünewald," after Sandrart — and make him one of the most admired, popular, assiduously studied, and frequently reproduced artists in the world. In him the expressionists found the antithesis of the profane, in a certain sense naturalistic, Italian Renaissance; in him they saw the living embodiment of inner vision, of the capacity to see and feel with the eyes of the spirit, to achieve a symbolic and emotional transfiguration of reality. Nolde declared him "the most powerful of all painters." All the most dramatic religious compositions of the expressionists are openly modeled on his paintings, especially the great altarpiece of Colmar. In the first enthusiastic monographs much was made of the painter's mysticism and his value as a typical representative of German religious mentality (see the writings of Huysmans, Crusius, Mayer, Hausenstein, Wölfflin, and, on the role of light in his work, Boos).

The theory of mysticism was confirmed by the discovery of an iconographic relation between some of the compositions

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

and the *Revelations* of St. Bridget, which just at the beginning of the 16th century gained wide circulation through printing (Feurstein, 1930), and by the numerous iconographic studies published in the 1920s (Walter, 1920; Bernhart, 1921; Groner, 1920; see also Zülch's articles, in the bibliog. of his 1938 work). The spiritual drama of the artist, torn between obedience to the pure "divine" laws of painting and participation in the religious and social conflicts of his time, is most vividly presented in the opera *Mathis der Maler*, written and composed by Paul Hindemith (1935), in which some of the content of the *Isenheim Altarpiece* is brought, quite successfully, to the stage. The main theme is perhaps epitomized in the exchange between the painter and the leader of the peasants in revolt: "Broken heads can mend the world, then?" "Better than your painted saints." The whole work, charged with bitter anti-Nazi feeling, seeks in its hero the embodiment of the true German folk spirit.

Subsequent estimates of Grünewald have depended less on esthetic insight, perhaps, than on scholarship, which, thanks especially to Zülch, has finally succeeded in illuminating the figure of the master historically, giving him a name, a biography, and a background. The conception of him, once founded on little more than a vague impression of mysticism, has been clarified by analytical studies of the purpose of his art and of the influences upon him. It is known, for example, that the *Isenheim Altarpiece* was intended for a famous hospital that also treated the mentally disturbed; its suggestive power was supposed to produce a violent emotional shock in the patients, who hoped to be miraculously healed by it (Vogt, 1958). The iconographic tradition of the Anthonin order, which commissioned the altarpiece, has been examined by Cuttler (1956). Other iconographic sources besides St. Bridget's *Revelations* — the scope of whose influence has been defined with exactitude by such scholars as H. Gasser (1958) — have been discovered in popular sermons (Dyroff, 1930) and devotional images (Haug, 1953). The attribution of some portraits to Grünewald has shed light on the circle of his acquaintances and, above all, has opened avenues of interpretation other than the purely religious. As Pariset remarked in 1931, "Grünewald is also a realist, a traveler, a supervisor of works, a businessman; what is more, a member of the court circle, if not actually a courtier, ideally placed in a center of art and culture. Owing to his office, he was considered the peer of the greatest men of his time, in a position to know the manifold aspects of Renaissance art and to find around him . . . marvellous subjects of observation." The studies on both similarities and contrasts with Dürer and Cranach have proved ever more fruitful, as has the analysis of Flemish and Italian influences. (Among the latter that of Jacopo de' Barbari must be singled out as determinant.) Criticism today tends to analyses of specific aspects of Grünewald's work. However, the comparative study (attempted, to a certain extent, by Weixlgärtner, 1949) of his artistic contemporaries in Germany and also in Switzerland and Italy — animated, like him, by the spirit of the Reformation — is likely to provide a historically and psychologically more accurate frame of reference for his drama and his art. Thus it may eventually be shown that the peculiarities of his style grew out of a widespread European attitude, an anticlassicism which, as Vogt (1957) observed, found in him not a mysterious outlet but a conscious translation into representational terms.

**GUARDI.** The most famous member of this family of 18th-century Venetian painters was Francesco (b. Venice, Oct. 5, 1712; d. Venice, Jan. 1, 1793). His father Domenico, baptized at Mastellina, Trento, on May 22, 1678, was called to Vienna at an early age by his uncle Giovanni, canon of St. Stephan. On Mar. 12, 1698, Domenico married Maria Claudia Pichler, who gave birth the following year to their first son, Giovanni Antonio. They then moved to Venice, where the other children were born: Maria Cecilia (1702), who in 1719 married Giovan Battista Tiepolo (q.v.); Francesco (1712); and Nicolò (1715). Domenico Guardi died on Oct. 16, 1716. According to P. Panizza (1912), Domenico was a talented decorator; but since no sure work by him is known, his alleged role as intermediary between Venice and the Austrian baroque remains hypothetical. This is typical of the extreme scarcity of documentation — both visual and literary — for the works of the Guardi family, a scarcity which has raised many questions of attribution. The problem of attribution is due also to the way in which the "Guardi brothers" (so described in a document of 1731) must have worked, that is, in a family workshop in the tradition of Venetian artists and craftsmen (e.g., see BASSANO). There are various paintings clearly from this workshop in which the share contributed by Giovanni Antonio and/or Francesco remains a matter for debate — not to mention Nicolò (whose artistic personality is still wholly undefined) or the possible participation of other collaborators and pupils. One of these, in 1742, was the young Francesco Casanova, brother of Giacomo and later famous as a battle painter.

Francesco Guardi must have begun working quite early in the service of his brother Giovanni Antonio, especially in figure painting. There is no information concerning Francesco during this long early period, the only document of any kind being the *Allegories* (Sarasota, Fla., Ringling Mus. of Art), female figures of Hope and Faith signed and dated 1747. In 1760 Francesco married Maria Pagani, and in the following year he joined the painters' guild of Venice. In 1763 he painted two canvases for S. Pietro Martire in Murano, one of which, the *Miracle of St. Hyacinth*, is in part preserved in the Vienna Kunsthistorisches Museum (PL. 98). In 1764 he exhibited two Venetian views at the Procuratie, on the basis of which he is described in the diary of his contemporary Pietro Gradenigo as a "good pupil of the celebrated Canaletto." Some time after 1771 Francesco executed an altarpiece, since dispersed, for S. Cristoforo della Pace in Venice; probably about 1775, the recently discovered altarpiece in the parish church of Roncegno, Trento; and certainly after 1776, the famous *Fiera della Sensa*, or *Festival of the Ascension* (Vienna, Kunsthist. Mus.). Several of his canvases, among them the *Gala Concert in Venice* (PL. 100), commemorate the festivities held in Venice in January, 1782, to honor the Archduke Paul Pavlovitch and Archduchess Maria Fedorovna of Russia. In the same year he was officially commissioned to paint four episodes from Pius VI's visit to Venice; these works still exist in the original and in replicas. The portrait of Andrea Dolfin (Rome, private coll.) is signed and dated 1783. The *Mongolfiera* (Berlin, Staat. Mus.) represents a balloon ascension of 1784, the first in Venice. Drawings and paintings record the 1789 fire in the San Marcuola quarter; the drawings of the Duc de Polignac's wedding are from 1790; and a drawing of the theatre "La Fenice," inaugurated in 1792, brings us to the end of Guardi's life. Not until 1784 was Francesco Guardi elected a member of the Venetian Academy as "*pittore prospettico*," or view painter, with nine votes for him and two against.

Francesco Guardi's earliest signed and dated work, the Sarasota *Allegories*, is stylistically similar to the figure paintings of his brother Giovanni Antonio but is less exquisite, more robust and decisive in handling, with strong brush strokes and outlines. These characteristics are in accord with those found in two other signed works, depicting a saint (Trent, Mus. Naz.) and the Virgin (formerly, Vicenza, Coll. Tecchio). In the *Miracle of St. Hyacinth* of 1763 the influence of Alessandro Magnasco is strongly apparent; this influence was of fundamental importance in the formation of Francesco's style and shows itself in the vividly contrasting lights and in the arresting, summarily indicated figures (*macchiette*) of countless Guardi views. The Roncegno altarpiece shows Francesco's distinctive figure style at a later phase of his career. The signed *Pietà* and several other figure paintings are also attributed to Francesco's later period on the basis of their style.

Although Francesco's figure paintings are often of fine quality, his most characteristic works are the views (*vedute*), whose lyricism goes beyond the limits of rococo taste, translating the data of objective scene painting into imaginative impressions (PLS. 99, 101, 102; I, PL. 410; IV, PL. 279). Even with documents lacking, it is clear from his works that at a certain point Francesco began to imitate Canaletto (q.v.), especially Canaletto's early views, which still could easily be seen in Venice, particularly in the collection (later transferred to England) of the British consul James Smith. Canaletto clearly inspired Francesco's two great views in the former James de Rothschild Collection at Waddesdon Manor near Aylesbury, Buckinghamshire; the view of S. Giorgio Maggiore in the Glasgow Art Galley; the two views of the Rialto in Lord Iveagh's collection at Pyrford Court, near Woking in Surrey (a replica of one appears in the Met. Mus.); and the *Campo SS. Giovanni e Paolo* at the Louvre. There is reason to place this approximation of Canaletto's early style in the decade 1750–60 — a style even closer to that of Marco Ricci, from which Canaletto had evolved. Guardi's imitation of Canaletto at this time was so deliberate that it invalidates the attempts made to place an earlier date on certain of Francesco's works in which the qualities of Canaletto were plainly reworked in the characteristic Guardi manner. This imitative phase must have lasted but a short while; and when, in 12 canvases now mostly in the Louvre, Francesco literally repeated the compositions commemorating the festivals honoring the election of a doge that Brustolon engraved from Canaletto's drawings and published in 1766, the results were no less personal than those the Guardis achieved in their copies of Francesco Solimena, Pietro Longhi, or Sebastiano and Marco Ricci.

For about 30 years, until his death in 1793, Francesco worked intensively, producing views of Venice and imaginary landscapes or architectural fantasies (*capricci*). In this, the phase of his activity for which he is best known, he can be considered a successor of Canaletto, even though Guardi's work is very different from the older artist's in character and effect. In fact, Francesco's interpretation of Venice was entirely new and personal. He recorded not so much the city's topographical facts as its ephemeral aspects — shifting lights and changing colors; and as he grew older, he tended more and more to accentuate its unreal aspects. The *capricci* also seem to become progressively more lyrical, arbitrarily arranged, and inventive (V, PL. 241). Even when, between 1782 and 1790, Francesco acted as a chronicler of Venetian events, he remained relatively unconcerned with objective accuracy, and his rapid, economical mode of painting and drawing produced an altogether subjective expression of the character of an event, emphasizing those particulars which appealed to his imagination.

Giovanni Antonio Guardi was born in Vienna, where he was baptized in the Schottenkirche on May 27, 1699. Documents published by Antonio Morassi tell us that he was active from 1730 to 1746 in the service of the Austrian field marshal Johann von der Schulenberg as an executor of copies, some of which have been identified. Further documents concerning Giovanni are sparse. There exist only references to his dealings in the Trentino, where he, and subsequently his brother Francesco, went to take care of family interests, and to his invitation to join the Venetian Academy at the time of its founding under the presidency of Giovan Battista Tiepolo in 1756. Giovanni Antonio died in Venice on Jan. 22, 1769.

The one known signed painting by Giovanni Antonio, the *Death of St. Joseph* (destroyed; formerly, Berlin, Kaiser-Friedrich Mus.), must be dated fairly early, for in it the character-

istic tendency to a loose, agitated pictorialism — a tendency later fully developed in other works that it seems reasonable to attribute to the same artist — still appears restrained. There exist many drawings as well; especially important among them for its indication of his stylistic development is the signed *Triumph of Military Virtue* (Geneva, private coll.). Various drawings displaying Giovanni Antonio's name in old inscriptions are convincing attributions, even if generally not autograph, and still others may be attributed to him on the basis of affinity with these. Several figure paintings of a "Guardiesque" character have been assigned to this artist because they display features clearly different from those characterizing his brother Francesco's hand. Among these works are *Soliman and Ismenias* (formerly Venice, Coll. Alvera); *The Story of Joseph* (Milan, Coll. Lutomirski); the *Holy Family* (PL. 97); the ceiling and overdoors, formerly in the Suppiei Palace, Venice, and now in the Barnabò Palace in Venice; the frescoes in the Ca' Rezzonico, originally from the Dabalà Palace; the altarpiece in the parish church of Cerete Basso, Bergamo; and, at least in part, the eight very large paintings representing scenes from Tasso's *Jerusalem Delivered* that were recently discovered in Ireland.

There are also numerous works in which, although there may have been some collaboration, the dominance of Giovanni Antonio's hand in composition and over-all style seems clear. These works are the altarpieces in the parish churches of Vigo d'Anaunia in Trento and Belvedere di Aquileia and Pasiano di Pordenone in Friuli; the lunettes in the church of Vigo d'Anaunia; the *Amorini* now in the Italian Embassy in Paris; and finally, the famous canvases of the organ parapet of the Church of the Arcangelo Raffaele in Venice, scenes from the story of Tobias (PL. 98). It is probable that Francesco worked on these last canvases, which are of exceptional quality, for there appear in passages more marked separations of color and more pronounced outlines than are usual in his brother's loose brushwork. The personality of Giovanni Antonio, a figure long neglected, has begun to emerge in the light of recent studies. His style has been identified as representing an extreme phase, in a rococo key, of Venetian colorism. It is a style that recalls the iridescence of Andrea Celesti, the coloristic improvisations of Giovanni Antonio Pellegrini, and the preciosity of Giuseppe Bazzani; and with great freedom it develops Sebastiano Ricci's tonal harmonies and nimble touch in unreal pictorial fantasies spiritedly handled. Like his brother Francesco, Giovanni Antonio Guardi often drew upon the paintings of other masters, both past and contemporary; nevertheless, as in his brother's case, the results were not so much copies as interpretations or correspondences in his own highly stylized idiom.

Nicolò, the last of the Guardi brothers, was born in Venice on Dec. 9, 1715, and died there on May 26, 1785. He is remembered as "pittore anch'egli di nome" ("also a painter of repute") — in relation to Francesco — in the 1790 catalogue of the Vianelli Collection, Chioggia, which included a pen-and-ink landscape. Elsewhere he is characterized as "estimio pittore di camera," an estimable decorative painter, but nothing further is known. It is probable that Nicolò, too, was taught by his brother Giovanni Antonio and worked in the family workshop, first with him and then with Francesco. Since no work of Nicolò's is known as yet, however, there is no basis for any stylistic evaluation.

Giacomo Guardi, son of Francesco, was born in Venice on Apr. 13, 1764, and died in that city on Nov. 3, 1835. He figures solely as a modest and rather pedestrian imitator of his father. Giacomo's numerous Venetian views and imaginary views are sometimes hurriedly confused with those of Francesco, the more easily since he often based his work on his father's drawings. Some signed paintings by Giacomo Guardi exist in private collections, and many drawings may be attributed to him, among them a group in the Warsaw National Museum and more than a hundred in the Museo Correr in Venice.

The critical fortunes of the Guardis have fluctuated greatly. In the compendium published by Alessandro Longhi (1762) and in A. M. Zanetti's *Pittura veneziana* (1771) they were not even named. Subsequently Luigi Lanzi, in his *Storia pittorica* (1789), considered Francesco as a painter of "effects," weak in the "ragion dell'arte," or the science of art. This evaluation was repeated for many years, with sporadic dissenting judgments, even though collectors and connoisseurs manifested continued interest in Guardi views. A full reevaluation of Francesco Guardi did not come until G. A. Simonson published his significant monograph on the artist (London, 1904). After this publication, critical esteem for Guardi began to mount (even though sometimes on the basis of arbitrary interpretation as a kind of avant-garde impressionist), and only more recently has Roberto Longhi, in his *Viatico per cinque secoli di pittura veneziana* (Florence, 1946), expressed some reservations, especially regarding the repetition of certain formulas. Giovanni Antonio, for so long almost forgotten, began to emerge only from the time of Gion Fogolari's study "L'Accademia veneziana di pittura e scultura" (*L'Arte*, 1913). In 1919 Giuseppe Fiocco published the paintings of the organ parapet in the Arcangelo Raffaele and attributed them to Francesco. Soon, however, the questions of attribution mentioned above began to develop. Only in the most recent criticism has Giovanni Antonio been assigned an increasingly important share in the figure painting, especially after E. Arslan's essay "Per la definizione dell'arte di Francesco, Gianantonio e Nicolò Guardi" (*Emporium*, C, 1944).

**GUARINI,** GUARINO. Architect (b. Modena, Jan. 17, 1624; d. Milan, Mar. 6, 1683). Having entered the Theatine order, Guarini went to Rome as a novice and after his return

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

to Modena he (with Father B. Castagnini) supervised the construction of the Church of S. Vincenzo and of the Theatine monastery attached to it (1649–55). In 1655, after having taught philosophy, he was elected *praepositus* of the order's house in Modena. The election was ill-received by Alfonso IV d'Este, who forced Guarini to leave the city — the beginning of a long period of travel. In 1660 he was in Messina, where he was responsible for the convex-concave façade for the Church of the Annunziata, built by the Theatines along the lines of S. Andrea della Valle in Rome; he also erected another building nearby, emphasizing the geometric character of its plan. The attribution to Guarini of works of somewhat later date, such as the façade and campanile of S. Gregorio, is without foundation. More probable is his participation in the construction of the baldachin of the Cathedral, and certain, but difficult to document, is his activity in the Church of S. Filippo, which was begun in 1618 on a basilican plan and was destroyed in the earthquake of 1908.

Guarini was in Modena in 1662 and from there was called to Paris, where the Theatines were engaged in building the Church of Ste-Anne-la-Royale. The plan, reproduced in his *Disegni d'architettura civile ed ecclesiastica*, is still linked to traditional schemes. However, the drum is lightened by an arcade supported on paired columns, on which is raised a small, flattened dome formed by interlacing arches. The octagonal juncture of these arches is left open, and over it is raised another small dome. What was to become the typical Guarinian scheme is here still used decoratively, yet the basic elements of future development already appear: the domes set one upon the other, the oval chapels, and the façade that reflects the structure of the interior. The construction of Ste-Anne-la-Royale, which had been interrupted after a few years, was resumed in 1714, following the designs of Liévain. (The church was destroyed in the early 19th century.)

Clearly traceable to Guarini's stay in Paris is the plan of a palace illustrated in plates 23 and 24 of his *Architettura civile*, in which one already sees, in the distribution of the masses and sinuous adherence of the court walls to the volume of the stairs, forms that were to characterize the castle at Racconigi (PL. 106) and the Palazzo Carignano, Turin (PLS. 104, 105). In Paris Guarini taught theology and published his *Placita philosophica*, but he was soon summoned to Turin, where he arrived in 1666, probably for work on the Church of S. Lorenzo (PL. 103; II, PLS. 142, 143), the construction of which was begun in 1634 but was later delayed. In comparison with the ground plan of Ste-Anne-la-Royale, that of S. Lorenzo exhibits a greater geometric strictness. The interior space is defined by eight convex sides, each of which is pierced by an archway with trabeated openings on either side; the walls behind recede in concavities variously accentuated. The altars are installed in such a way as to seem to undermine the walls, so that the whole structure appears to be supported by columns and piers. The difficulty in immediately perceiving the geometry of the plan increases the sensation of instability. The spatial elaboration of the openings of the tripartite windows, the smooth surfaces of the pendentives, and their apparent thinness all serve to accentuate the tension and to prepare one for the intricacy of the dome. At every point windows are introduced, even over the center of the archways, in order to emphasize the fragility of the walls. The organic structure which might be imagined from the appearance of the interior has a specious probability but is not true to fact. The elements which sustain the considerable weight of the dome are hidden in the convex envelopes of the pendentives, and the weight of the latter alone presses upon the columns.

The conflict between the vocations of the mathematician and of the impressionable decorator brought up on Roman, French, and south Italian models (but possessed always of a dilettante's enthusiasm) can be recognized in such things as the marble covering of the altars, rich with precious stones and statues; the fluent and imaginative stucco work above the great arches; and above all, in the treatment of the orders, in which can be seen constant use of naturalistic motifs and a determined search after every conceivable variation.

In 1668 Guarini was named engineer and mathematician to Charles Emmanuel II of Savoy and entrusted with building the Chapel of the Sta Sindone (Holy Shroud) in Turin, for which plans had earlier been supplied by Castellamonte (II, PL. 143). Previous to the intervention of Guarini, there might have been envisaged a triangular-plan solution, on the order perhaps of Ascanio Vitozzi's SS. Trinità in Turin. But with Guarini a new spirit makes itself felt. The preference for black marble affords the architect an opportunity to purify his decorative style. The brilliant incrustation of S. Lorenzo is replaced by an idiom of utmost purity dominated by the network of stars set upon the walls. The ground plan is circular, and set in contrast to the great archway that opens onto the nave of the Cathedral are two colossal arched niches divided in two by piers. Three entrances are put into the space between these arches: two steep flights of stairs of convex shape lead down into the church for the entry and exit of the faithful, and one, for the prince, is set on the axis of the chapel and on a level with the palace. Large round windows that free the walls of all sense of mass and concentrate the lines of force in the slender arches are introduced into the pendentives as well as into the shells of the two great niches. Above the cylindrical space of the room proper is a zone of vital juncture with the narrow circle of the dome. Over all the walls of this area is spread out radially a decoration of stars, masterful application of a decorative principle used traditionally in the coffering of domes. But above the solid ring of wall that ends this zone comes the most surprising part of the dome, its pierced latticework. The architect's feeling for his material is seen in the plain dressed stone of the small arches of the drum. The windows (horizontal openings were substituted for the oval ones seen in the first project engraved in Brinckmann's *Theatrum novum Pedemontii*) lighten the hexagonal divisions of the wall. Finally, this whole composition of superimposed sections is tied together by moldings that zigzag up and down. From below one gets the impression of a series of hexagons that diminish in size as they pile up, the vertex of a higher one being in line with the mid-point of a side of the larger one below it (FIG. 196). The product of the surmounting of incredible difficulties, the end result has a particular violence. The force and coherence that mark the interior of the dome are not maintained on the exterior. A lively contour is determined by the placement of the windows, set like gems above a drum of dark brick. The whole, however, lacks unity and spirit, and the lantern, with small false windows cut into white marble, is little improvement.

While at Turin, Guarini published the *Modo di misurare le fabbriche*, the *Trattato di fortificazione*, and his *Euclides adauctus*. In 1678 he was at work on the enlargement of the castle at Racconigi. The façade facing the park was animated by two projecting units with curved cloister roofs. The influence of French castles, and the memory of some Emilian ones, is evident in the

Turin, Chapel of the Sta Sindone, plan of the dome at the height of the capitals.

handling of volumes, in the stairs, and in the crowning of the ensemble. In the garden of the castle he built an elliptical casino topped by a dome, the whole constituting a sort of Guarinian version of Bramante's Tempietto in S. Pietro in Montorio, Rome. At this time too Guarini was dealing with the problem of connecting a chapel dedicated to the Virgin, part of the new sanctuary of the Consolata, with the old church of S. Andrea. He used four piers and the foundation walls of the old building and contrived the intersection of an aisleless, twin-apsed nave with a hexagonal space to serve as a presbytery that was probably covered by a ribbed vault. Subsequent alterations have deprived the church of almost every element of Guarini's work except the exterior of the nave. In 1679 Guarini was elected *praepositus* of the Theatine house in Turin, and his activity increased: Emanuele Filiberto, prince of Carignano, wished to have him in his service; for the Jesuits Guarini began building the Collegio dei Nobili (now the Accademia delle Scienze), a massive block from which the forms of cornices and orders barely emerge, heightening the dramatic effect and the severity produced by the dark brickwork. Noteworthy is the use of some ribbed ceilings on the ground floor of the building, like that over the grand staircase of the Palazzo Provana di Collegno, attributed to Guarini although erected after his death.

Also of this period is the project for the little Church of St. Mary of Altötting in Prague, called also Our Lady of Perpetual Help, one of the simplest and most successful of Guarini's plans. The builders, however, did not follow faithfully the designs sent them from Italy. The most important commission of this second period in Turin is the palace of the Prince of Carignano (PLS. 104, 105). Designed for a much narrower piazza than the present one, the sinuous façade originally had a different aspect. The ostentatious exploitation of the brick itself is a principal focus of interest. The form of the cornices, shaped of cut brick, has the crudeness that the material imposes, but the simplicity and novelty of the parts demonstrate sure technical mastery. The composition is dominated by the oval cylinder of the entrance hall and of the Piedmontese Chamber of Parliament behind it, which rises above the entire structure and projects out into the middle of the courtyard, whose walls are covered by the exuberant geometry of stars incised upon the bricks. The beauty of the façade is born of its geometry, of the meeting and precise intersection of simple volumes, of the rhythm of raised and sunken areas.

In 1679 Guarini considered two solutions for the Church of S. Filippo Neri (FIG. 197). The first plan published in the *Disegni d'architettura civile ed ecclesiastica* does not correspond to the one adopted after Guarini's death by Michelangelo Garove

Turin, S. Filippo Neri, plan (from *Disegni d'architettura civile ed ecclesiastica*).

and carried out until the collapse of the still incomplete dome in 1714. In the plan of the *Disegni* there is no trace of a dome; on the contrary, there is the strictest application of the principle of a nave composed of interpenetrating spatial units. In contrast to what is to be seen in the plan for the Church of S. Maria da Divina Providência in Lisbon (destroyed in the earthquake of 1755), the curved line is completely banished. In the Lisbon church every member moves in an obsessive rhythm: even the piers are twisted, and the frieze is decorated with an example of that "wavy order" described in detail in the third treatise of his *Architettura civile*. The difference between these two solutions casts light upon the master's working methods. It is to the sure process of geometric elaboration that he entrusts

Turin, Church of the Arcivescovado, plan at the springing of the vaults.

the creation of the formal vocabulary of his works, with the result that they seem to arise less out of any general idea than from a scheme for the linking of parts, from the systematic repetition of a basic unit. Thus the attribution to Guarini of the Church of the Arcivescovado (PL. 105) in Turin, while without documentary basis, is acceptable on account of the inventive conception of the structure, altered though that has been by a meager translation of the plan (FIG. 198). This is the only example in Italy of that scheme of juxtaposed spatial units that ranks among the fundamental discoveries of the architect. The design of the façade of the Palazzo Graneri at Turin, built in 1683 by Gianfrancesco Baroncelli, may perhaps be traced to a plan of Guarini's.

Among the unrealized projects of this period, that for the remodeling of the Church of S. Nicola at Vicenza (published in the *Disegni d'architettura ed ecclesiastica* as S. Gaetano) merits particular attention. And the discovery of several designs of 1695 has permitted the certain attribution to Guarini of the Church of S. Maria d'Aracoeli, also in Vicenza. The project for the Church of S. Filippo at Casale Monferrato met with an unhappy fate. Pier Francesco Guala, put in charge of construction, kept in mind only the master's designs for the dome, and even there demonstrated absolute incomprehension of Guarini's intention. The inscribed-cross plan is produced by placing four circles in the arms of the cross and four tetracuspids (figures obtained by setting opposite one another the convex faces of four quarter-circles) in the reentrant angles of the cross. The simple and harmonious rhythm that results generates a strongly centralized space, bounded by clear and relatively plain surfaces. Perhaps from this period comes the plan for the Church of the Somaschi at Messina, which repeats on a hexagonal basis the plan of S. Lorenzo, making out of large projecting arches a circular corridor that has a remote antecedent in S. Costanza in Rome. In the plan for the sanctuary at Oropa the centralized octagonal layout features new variations on the theme in a more extensive development of flat and curved surfaces. Somewhat in the same manner as that of the Chapel of the Sta Sindone, the dome develops out of the piling up of three octagonal units, the corners of the upper ones set at the mid-point of the sides of the lower. A more harmonious variation is the project for St-Cajetan at Nice (built much later from designs by Bernardo Vittone). This sums up with rare simplicity some of Guarini's major accomplishments. Although its ground plan is pentagonal, the church recalls in some respects Borromini's Chapel of S. Ivo in the Palazzo della Sapienza in Rome (II, FIG. 556); however, the compact space of the chapel for

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

the Sapienza gives way here to the extraordinary development of an essentially mannerist theme. This is Guarini at his most Borrominian (see BORROMINI), and it is the most extreme of all his central plans. Of two unspecified plans reproduced in the *Architettura civile*, one, on plate 33, has been referred to the palace of the Conte di Govone and the other, on plate 34, to a church in Turin never actually built.

The Church of the Madonna di Loreto at Montanaro was also constructed with designs furnished by Guarini, but without his personal help, by builders of little ability. Recognizable as his, however, are the pentagonal choir and the design of the capitals of the columns in the interior. Of greater interest is the tabernacle of the Church of S. Nicolò in Verona, executed by Carlo and Giambattista Ranghieri but, because of an engraving of the *Disegni d'architettura civile ed ecclesiastica*, to be counted among the few of the master's surviving works.

Although the successor to Alfonso IV had in 1672 repealed the decree of exile, Guarini continued to be kept in Turin by the commissions he had assumed. In 1680, however, he returned to Modena, where he supervised the completion of the ducal palace. To him can be attributed the design of the niches that adorn the stairway, built according to the original plan furnished by Bartolomeo Avanzini. In the facing of these niches, into which is cut a fluted shell, one sees again a motif used in S. Lorenzo and in the Chapel of the Sta Sindone.

Guarini was busy these last years with the preparation of his two-volume work, the *Coelestis mathematicae*; he died while on a visit to his publisher in Milan.

As a theorist Guarini was most influential in the field of architecture. At the first appearance of his *Disegni d'architettura civile ed ecclesiastica* in 1686, many of the published plans decisively affected the course of architecture in northern Europe. Guarini's theoretical principles were also diffused by Bernardo Vittone (1704–70), the architect most sensitive to Guarini's influence. In 1737 Vittone published, together with the plates of the *Disegni d'architettura civile ed ecclesiastica*, the text of the *Architettura civile*. The treatise reveals what means are offered to the architect by the experimental method and the study of science, although in general it still follows the classical models of the Renaissance. Particularly interesting are evidences of an interest in Gothic architecture, whose boldness and inventiveness Guarini notes, although he disapproves of its proportions. Brief note is also taken of the problem of the relation between mathematics and architecture, and despite the closeness of the two disciplines, the priority of visual over technical considerations is affirmed. Of much greater influence than either his theory or his working out of methods of projection (elaborated by Guarini to facilitate the measuring of complex building parts) was that vocabulary of curvilinear forms, intuitively obtained, from the plates of his *Disegni d'architettura civile ed ecclesiastica*, which suggested an easy and stimulating way to compose spatially and to affirm thereby the value of form as a determinant of space, without deviating from the canons of classical proportion.

**GUATEMALA.** The Republic of Guatemala is bounded on the north and west by Mexico; on the east by British Honduras, the Caribbean Sea, Honduras, and El Salvador; on the south by the Pacific. Within its territory, as well as in what are now the Mexican states of Chiapas, Tabasco, and Yucatán, developed the Maya civilization, rightfully considered among the most remarkable of the pre-Columbian epoch. The Spanish subsequently united Guatemala proper, El Salvador, Honduras, and Chiapas into a single captain-generalcy which they called the "Kingdom of Guatemala." Guatemala, for nearly three thousand years the scene of intense artistic activity, still displays innumerable traces of both the pre-Columbian and colonial epochs.

SUMMARY. The pre-Columbian epoch (col. 200): *The lowlands; The highlands; The Pacific plain.* The colonial and modern epochs (col. 204): *Modern centers.*

THE PRE-COLUMBIAN EPOCH. Although the Maya civilization lasted for over 2,000 years, the Mayas never created a unified state: numerous politically independent cities divided the territory among themselves. They had all sprung from a single cultural stock, but each city followed its own pattern of life and had its own laws and mores. Archaeologically speaking, their culture is divided into three periods: the preclassic, the classic, and the postclassic. The first-named lasted until about A.D. 300; the second, from the 4th to the 10th century; the third, until the Spanish Conquest (see MIDDLE AMERICAN PROTOHISTORY). The territory is divided into three zones: the hot, humid low-lying plains of Petén and the lower reaches of the Motagua River, whose religious and cultural centers, after a splendid heyday, were abandoned about the 10th century; the central mountainous regions, in which the cities were still in full sway in the 16th century and in many cases offered desperate resistance to the conquistadors; lastly, the Pacific plain, with its mountainous spurs, which was an area of transition and cultural exchange between the Mexicans and the Mayas. Archaeological research since about the 1930s has revealed many sites whose ruins have for centuries been invaded and overrun by vegetation. Thus a clear conception can now be formed of the country as it was in pre-Columbian times.

*The lowlands.* Cities in the lowland areas were generally larger than elsewhere, it seems, and the highest pyramids surmounted by temples were found there. One characteristic feature of the architecture in this zone is the Maya corbeled vault. The ceilings in most of the palace rooms in Petén are not flat but are constructed as corbeled vaults formed by a progressive thickening of the side walls. The narrow opening remaining at the top is closed by a flat stone. No less characteristic in the lowland zone are the steles which every urban center would erect periodically. These are often dated and bear hieroglyphic inscriptions.

Tikal. This, the principal Maya city, is located about 27 air miles northeast of Flores, administrative center of the Petén department. It is easily accessible, owing to the construction of an airport. Here is found the highest (ca. 240 ft.) temple in Guatemala. Two other temples, over 155 and 140 ft. high, in their turn overtop the loftiest trees in the forest. Also well preserved are the temples atop pyramids, whose cut stones were coated with plaster, and the palaces,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

with whitewashed walls, in which some wooden beams are still to be seen. A few carved panels are visible *in situ* within the temples, but the most famous of these is now in Basel (Mus. für Völkerkunde; X, PL. 16). A team of archaeologists from the University of Pennsylvania has been engaged since 1956 in freeing the structure still hidden under vegetation. The work was expected to continue for some twenty years.

Tikal, ground plan of the central area of the ruins: (*a*) Group H; (*b*) Group E; (*c*) Group F; (*d*) northern acropolis; (*e*) large plaza and Temple II; (*f*) Group A; (*g*) Ball Court; (*h*) Temple I; (*i*) Group D; (*j*) Temple IV; (*k*) central acropolis; (*l*) Temple III; (*m*) Group C; (*n*) southern acropolis; (*o*) Group B and Temple V; (*p*) Group G.

Tozzer, Preliminary Study of the Ruins of Tikal (Mem., Peabody Mus., Harvard Univ., V, 2), Cambridge, Mass., 1911; A. M. Shook, Investigaciones arqueológicas en las ruinas de Tikal (Dep. de El Petén, Guatemala, Antropología e historia de Guatemala, III, 1), Guatemala City, 1951, pp. 9–32.

Uaxactún. Eighteen air miles north of Tikal, this city too is now accessible owing to the construction of an airport. It is Uaxactún that persisted longest in the custom of erecting steles. Between the earliest stele of this site, bearing the date 8.14.10.13.15 (A.D. 328), and the most recent, dated 10.3.0.0.0. (A.D. 889), there is an interval of 561 years. In all, 49 steles have been discovered, 26 of which are dated.

Particularly fruitful excavations were made between 1926 and 1937 under the auspices of the Carnegie Institution of Washington. Unfortunately, the mounds explored were inadequately protected, and the jungle has again taken possession of them. Several stratigraphic sections had shown the site to have been already inhabited for some 1,500 to 2,000 years when the Maya began to erect steles there; this means a total span of about 2,500 years. An abundance of pottery, now preserved in the Museo Nacional de Arqueología y Etnología in Guatemala City, was found at all levels, thereby establishing the sequence necessary for classifying all Guatemalan pottery.

BIBLIOG. O. G. Ricketson, Jr. and E. B. Ricketson, Uaxactún, Guatemala: Group E — 1926–31 (Carnegie Inst. of Washington, Pub. 477), Washington, D. C., 1937; A. L. Smith, Uaxactún, Guatemala: Excavations of 1931–37 (Carnegie Inst. of Washington, Pub. 588), Washington, D. C., 1950.

Piedras Negras. Located at the western extremity of Petén, in the valley of the Usumacinta River, this city owes its renown to the excellence of its sculptures. These can best be appreciated in the museum in Guatemala City for, as at Uaxactún, the vegetation has overrun the archaeological site. One face of the steles bears scenes in relief, showing one or more persons — chained prisoners before a priest, the corn god in the act of sowing, etc. The dates succeed one another at five-year intervals, from 9.8.15.0.0. (A.D. 608) to 9.19.0.0.0 (A.D. 810). Among the figures, there recurs with some regularity a personage seated on a throne within a niche. This figure appears on the earliest steles and gradually evolves into its ultimate form in the stele of 761, one of the finest of this site. A splendid mural panel exhibited in the museum in Guatemala City bears the same date, 761, which seems to mark the high point of the Piedras Negras sculptures. It is carved in the form of a niche, within which is the representation of a priest seated on a throne, surrounded by groups of people.

Naranjo and Seibal. Both are located in Petén, in dense jungle, and are the two sites in which the production of steles was latest (A.D. 608–820 and 746–869, respectively).

Holmul, Altar de Sacrificios, Poptún, and Tayasal. These sites too are located deep in the jungles of Petén. They lack monuments of sufficient interest to attract tourists, but the excavations there, particularly at Holmul, have been of great help in increasing our knowledge of the ceramics.

BIBLIOG. R. E. Merwin and G. C. Vaillant, The Ruins of Holmul, Guatemala (Mem. Peabody Mus., Harvard Univ., IV, 2), Cambridge, Mass., 1932.

Quiriguá. Situated in an agricultural area of the lower Motagua Valley and accessible by railroad, this site has escaped the fate of those in Petén. Its monuments are well preserved within a park maintained by the United Fruit Company. This city seems to have been a colony of Copán, an important Maya center located some 31 miles to the west in Honduras (q.v.). It owes its fame, not to its architecture, which is of secondary interest, but rather to its steles, which are decorated on all four faces. On the forward face is carved the figure of a personage with the head in deep relief; the lateral and posterior faces are covered with hieroglyphics. One of these steles, which is almost 35 ft. high, is the tallest one known.

Four of Quiriguá's steles, dated at successive five-year intervals, have been replaced by enormous so-called "zoomorph" carved blocks, remarkable for their fine workmanship. These represent monsters derived from the cat or toad families, usually combined with a human head or with a seated figure whose body is entirely covered with hieroglyphics or varied ornamentation (X, PL. 240). Before two of them stand carved altars.

BIBLIOG. S. G. Morley, Guide Book to the Ruins of Quirigua (Carnegie Inst. of Washington, Sup. Pub. 16), Washington, D. C., 1935.

*The highlands.* Save for two or three hundred Lacandón Indians living in the territory of Chiapas and Guatemala, all the lowland Indians have vanished. This has not occurred in the highlands, where the indigenous inhabitants form the majority of the present population and frequently retain their customs, as, for instance, the Quiché, who still go to burn copal among the ruins of Utatlán, while at Chichicastenango native priests perform their *costumbres* before the pre-Columbian statue of Pascual Abaj. Vestiges of the past, from the earliest periods to the Conquest, can be found throughout the area.

The earliest structures were made of earth. Stone construction developed only in the classic period and was more severe than in the lowlands: the pyramids were lower; the cities were built in more easily defended sites, fortified and provided with strategic platforms. The architecture is utilitarian, yet it has a certain grandeur. Monumental sculpture is almost entirely absent; the chief artistic expression is found in the ceramic censers and sculpture in the round. Sculptures have been discovered at Tajumulco, San Agustín Acasaguastlán, and in three caves at Queen Santo. Pottery adorned with hieroglyphic decoration has been found at San Agustín Acasaguastlán and intact plumbate-ware vases at Tajumulco.

Kaminaljuyú. Close by Guatemala City is a site where numerous mounds contain the ruins of ancient earthen dwellings. There the experts of the Carnegie Institution of Washington have conducted excavations that have made it possible to establish cultural sequences. The explored mounds have been completely destroyed, but others still remain intact. The Anthropological Institute of Guatemala has exposed various strata of earthen structures in the Palangana region.

Utatlán. Capital of the former Quiché kingdom, this city can be reached via road from Quiché. Until 1920, a pyramid was still standing there, but now the site is almost completely destroyed because the cut stone of the ancient structures has been carried away for use in building the modern city. Only outlines of the buildings' plans and a large plaza paved with stucco remain.

Iximché. This former Cakchiquel capital, accessible by road from Tecpán, has suffered the same fate as Utatlán. Several plazas covered with stucco have been discovered in recent years.

Mixco Viejo. This former city of the Pocomán is accessible, during the dry season, via San Martín Jilotepeque. With its nearly two hundred buildings, it was one of the largest cities in the region. Perched atop a rocky spur, bounded all around by the Pancajcó River and a girdle of precipices that made it easy to defend, Mixco Viejo was provided with a great many platforms oriented to allow surveillance of its surroundings and the narrow paths of access. It was composed of 11 sectors. A French-Guatemalan mission has explored, cleared, and reconstructed two of these sectors, with their pyramids, platforms, ball court, and great wall broken by staircases, as well as the principal pyramid of a third sector. A double pyramid is noteworthy. Pottery found at the site allows an approximate dating of the 14th or 15th century.

Zaculeu. Located near the airport of Huehuetenango, this city was the capital of the Mam. It stands on a platform surrounded on three sides by deep ravines. The ruins have been restored at the expense of the United Fruit Company. Of 43 mounds, 23 have been explored. The buildings are grouped around plazas. The temple of the principal pyramid has been restored (X, PL. 48). The objects found, belonging to the classic and postclassic epochs, have been assembled in a small local museum.

BIBLIOG. R. Woodbury and A. S. Trik, The Ruins of Zaculeu, 2 vols., Boston, 1953.

Chicol. Located about 9 miles from Zaculeu, which it apparently antedates slightly, it has some dozen earthen structures, including a ball court and a pyramid.

Cahyup and Chuitinamit. In Quiché territory, these sites may be reached from nearby Rabinal. They are similar in many respects. One has 42 remnants of structures, the other has 44, most of them covered with stucco. Each has a double pyramid; Cahyup also has another circular one. Chuitinamit is one of the best-preserved sites in the highland region. So far no excavating has been done there.

Chutixtiox and Xolpacol. These sites, too, are in Quiché territory, near Sacapulas. Chutixtiox — from *Chu* (above) and *Tixtiox* (church) in the Quiché language — is bounded on three sides by the Río Negro. Three plazas are discernible there, one of which is on the top of a hill, the other two being lower and accessible by stairways. A ball court was found in one of the latter. In contrast to most of the other cities, the structures of Chutixtiox are arranged without regard to symmetry. The pottery from the surface seems to indicate that the site was still occupied shortly before the Conquest. No excavations have ever been made here. Less important than Chutixtiox, Xolpacol — from *Xol* (amid) and *Pacol* (white earth) in the Quiché language — has a ball court and a circular structure, probably part of an altar.

Nebaj. In Ixil territory, accessible from Sacapulas, this must have been an important site, occupied for a long period of time. It probably served as a link between the highlands and the lowlands. The city is noteworthy only for its tombs, which date from an advanced phase of the ancient classic to the postclassic period. Several are covered by corbeled vaults. Richly sculptured ceramic censers, some jade items, and other objects (the most beautiful found in Maya territory) are in the Museo Nacional de Arqueología y Etnología in Guatemala City and elsewhere (X, PL. 30).

*The Pacific plain.* Numerous sculptures come from this zone. The best known are the steles of the region of Santa Lucía Cozumalhualpa (IV, PL. 204) and those of El Baúl and Bilbao. Mexican influence is evident there. These sculptures are attributed to the Pipil, an extinct tribe of Nahuatl stock. Several ritual axes, in the form of flattened heads, and stone yokes are comparable to those of the Totonac area (Veracruz state, Mexico).

The Pipil had also settled in the region of Asunción Mita, where there is an archaeologically important area in which the structures are covered with corbeled vaults.

El Baúl, Bilbao, and Ixtepeque. In the department of Escuintla.

Cerritos. In the department of Santa Rosa.

Asunción Mita. In the department of Jutiapa.

Henri LEHMANN

THE COLONIAL AND MODERN EPOCHS. Within the general characteristics of the baroque style, Guatemalan colonial art presents original aspects, particularly in its architecture and polychromed sculpture in wood. The construction of such cities as Antigua, built in the middle of the 16th century, displays standards of monumentality and a sense of adaptation to the landscape; the buildings are predominantly of stucco-covered brick. Despite the numerous contemporary chronicles, the architects' names are unknown. Generally Spanish monks planned the churches and monasteries, which arose in profusion during the colonial period, with native artisans supplying the labor. Also of outstanding interest are the private homes; the colonial house was generally two-storied, with broad portals opening onto the main arcaded patio, itself flanked by two smaller patios.

In the latter half of the 16th century, there was a thriving production of polychromed sculpture in wood of religious subjects called *imaginerías*; these were actually an imitation of imported Spanish forms enlivened by native folkloristic accretions. Among the sculptors were many Spanish emigrants, as well as mestizos and mulattoes. After 1600, the importation and imitation of Spanish images ceased (save for the works of Juan Martínez Montañés); thus, at the close of the 17th century, there existed a thriving, original Guatemalan school, whose works were even exported to Mexico and Europe. There are several *imagineros* whose names are known, despite the unsettled problems of attribution: Juan de Aguirre (late 16th cent.); Antonio de Rodas (active in Guatemala until 1611); Alonso de la Paz (d. ca. 1689); Mateo de Zuñiga (d. 1686); Quirio Cataño (d. 1620), whose origin is uncertain, but whose name might have been Quirino or Quirico Cattaneo, and who was probably Italian or Portuguese. Very few examples of retablos have remained intact; they display all the characteristics of the Spanish-American baroque style, the fruit of the collaboration between painters, sculptors, *ensambladores* (the craftsmen who constructed the wooden structure and did the intarsia work), *estofadores* (the craftsmen who covered the sculptures with gesso-coated canvas on which the colors were painted and gold leaf applied), and *doradores* (those who applied the gold leaf).

In the field of painting, which was but slightly developed, Spanish influence, that of Murillo in particular, is quite marked. Notable figures are Tomás de Merlo and Pedro and Francisco de Liendo. At the beginning of the modern period, the arts were greatly stimulated by the Sociedad Económica de Amigos del País, which as early as 1798 had established an Escuela de Dibujo (School of Design). During the 18th and 19th centuries, engraving was original and quite highly developed. (The first Guatemalan printing house, the fourth to be established in America, dates from 1600.) About the time of Independence (1821) the taste for neoclassicism along academic lines became popular, as did the art of portraiture, particularly portraits of families, examples of which remain mostly anonymous. Among the better-known painters are Casildo España, Pedro García-Aguirre, Francisco Cabrera, and Julián Falla. Sculpture, predominantly commemorative, also employed academic forms.

About 1920, there was a move to restore the national tradition, which favored returning to the native representational arts. Closely linked to the impressionist movement are Rafael Rodríguez Padilla (1890–1946) and Carlos Valenti (1884–1911). Later Carlos Mérida availed himself of indigenous elements for self-expression in abstract terms, while Alfredo Gálvez Suárez specialized in academically treated "Indian" scenes, and Humberto Garavito concentrated on landscapes. Among the eminent sculptors was Rafael Yela Günther (1888–1943), who was influenced by impressionism.

Guatemala. *Key*: (1) National boundaries; (2) regional boundaries; (3) archaeological sites.

In contemporary art, Guatemala participates in the various international trends; the most renowned artists today are the sculptors Rodolfo Galeotti Torres, Roberto González Goyri, and the sculptor-painters Guillermo Grajeda Mena and Dagoberto Vásquez.

*Modern centers.* Antigua. Artistically this is the most important city. Formerly the capital of the Kingdom of Guatemala, it was founded in 1543 by Pedro de Alvarado following destruction of the original capital (today Ciudad Vieja). In 1773, it was destroyed by earthquakes and abandoned. There are, however, many remains of monuments in the colonial style, among which are the churches, with their adjoining monasteries or convents, such as those of S. Francisco, La Merced, S. Clara, de Las Capuchinas, S. José Cathedral, La Recolección, La Escuela de Cristo, and Belén.

Among the notable civil structures is the Palacio de los Capitanes Generales (Government Palace), which was begun in 1550 and restored several times; it has two stories, and the façade has two orders of arcades. Also of interest is the University of S. Carlos, now the Museo Colonial de la Antigua, which dates from the 18th century.

Esquipulas. This was erected in 1754 at the center of what was then the Kingdom of Guatemala (close to the boundaries with Honduras and El Salvador) as a great temple flanked by baroque towers with stucco decoration. The much venerated *Cristo negro* of Quirio Cataño is here.

Guatemala City. Founded in 1776, the present capital has a checkerboard plan, with streets intersecting at right angles. The most important buildings date from the late 1700s or early 1800s. The religious structures include the Cathedral, begun in 1782 and completed in 1815; the churches of S. Francisco, S. Domingo, and the neoclassic La Merced. About 1917, the monuments were damaged by earthquakes and were later restored.

**GUERCINO** (BARBIERI, GIOVANNI FRANCESCO). Italian painter of the Bolognese school (baptized at Cento, Feb. 8, 1591; d. Bologna, Dec. 22, 1666). His nickname refers to his squint. Guercino's earliest training was at Cento under Benedetto Gennari the Elder, but his work early reveals the influence of the Carracci brothers, particularly Lodovico. Guercino's admiration for an altarpiece by Lodovico which is still at Cento is recorded. Frescoes of 1614 by Guercino in Casa Provenzali, Cento, show the influence of the Carraccis. In 1615 Guercino was in Bologna working on the Casa Pannini frescoes, on which he was assisted by Lorenzo Gennari: one fresco is dated 1615, and a document of 1617 records the completion of the work. His first important religious picture was the altarpiece for the Church of S. Agostino, Cento (1616; now, Brussels, Mus. Royaux des B. A.). In a letter of 1617 Lodovico Carracci mentions Guercino's presence in Bologna to carry out commissions for the Archbishop Ludovisi (later Pope Gregory XV). Guercino visited Venice in 1618; in 1619 he was at Ferrara, possibly not for the first time, where the Cardinal-Legate Serra patronized him. On the election of Gregory XV, Guercino went to Rome and was employed by the Pope and the Ludovisi family. There he executed, among other work, the *Aurora* fresco for the Casino of Villa Ludovisi (II, PL. 197), the huge *Burial and Reception into Heaven of St. Petronilla* (now Rome, Palazzo dei Conservatori, Pin. Capitolina; VIII, PL. 218) for St. Peter's, and a full-length portrait of the Pope (recorded in a 17th-cent. Ludovisi inventory). On Gregory's death in 1623, Guercino returned and settled in Cento. In May, 1626, he was at Piacenza to complete the fresco decorations of Morazzone (P. F. Mazzucchelli) for the dome of the Cathedral (finished in 1627). In 1633 he was in Modena, where Francesco d'Este patronized him (e.g., *Venus, Cupid, and Mars*, 1634; Modena, Gall. Estense). Although he received patronage widely in Italy and abroad, Guercino remained active at Cento until the death of Guido Reni in 1642, when he moved to Bologna. Charles I of England made a bid for Guercino's services, and he was also invited to France; neither proposal was accepted. From 1629 on, Guercino's brother, Paolo Antonio, a painter of still life, kept an account book of payments received by the two brothers for their pictures. After his death in 1649 it was kept by Guercino until 1665 and completed by Benedetto Gennari the Younger, the painter's nephew. Guercino's output and industry were considerable. He painted many easel pictures (of mythological as well as religious subjects), altarpieces, and a few portraits (the latter little studied). Work by Guercino is in most of the great galleries; a large collection of his drawings is in the Royal Collections, Windsor. His reputation stood high in his own day, though probably less high in cultured Roman circles than elsewhere in Italy. Although never forgotten, Guercino became the subject of serious scholarly research only in the 20th century. His early pictures show north Italian and Venetian influences, the latter probably first transmitted to him by way of Scarsellino's work. The significant change in Guercino's style after his Roman years has been commented on by all his biographers; his late style is usually recognized as a decline. The painterly handling of his early work was gradually replaced by tighter and tamer treatment and by attempts to mold a classic style after the example of Reni. In this process Guercino lost originality, achieving at best a certain dignified monumentality. (See III, PL. 311; IV, PL. 430.)

Michael LEVEY

**GUIANA.** This name is applied to an area of South America bounded by the Orinoco River on the north and west, the lower part of the Branco and the left banks of the Negro and the Amazon on the south, and the coast of the Atlantic on the northeast. The area thus includes parts of Venezuela and Brazil as well as British Guiana, Surinam (Netherlands Guiana), and French Guiana.

The three principal manifestations of art are objects from archaeological sites, such as pottery, rock engravings, and rock paintings; certain decorative arts of the Amerinds — mainly featherwork, basketry, and beadwork, with some pottery; and the art of the Bush Negro, principally wood carving. Esthetically the most outstanding is that of the Bush Negro, which is comparable with other tribal arts of distinction, notably the West African, from which the main elements of its character derive, since the Bush Negro originated in West Africa.

There are no colonial or modern towns of artistic interest and no noteworthy traditions of art.

SUMMARY. Ethnic and geographic situation (col. 208). Archaeological objects (col. 209). Indian tribal art (col. 210). Art of the Bush Negroes (col. 211).

ETHNIC AND GEOGRAPHIC SITUATION. The population of the Guianas is small (British Guiana, 376,000; Surinam, 220,000; French Guiana, 26,000), and it is concentrated in the coastal belt. The ethnic groups represented are Amerinds, Europeans, Negroes, Asians

Distribution of indigenous Amerindian tribes in the Guianas and adjoining territories.

(mostly East Indians), and African-European mulattoes, with the last two groups forming the largest proportion of the population. Physically the landscape consists of alluvial plains and deltas on the coast, 3 to 30 miles in depth, with thick swamp forest which is relatively heavily populated and cultivated. Inland there is higher country with true tropical forests, covering the major part of the area; this is intersected by rivers that provide virtually the only means of land communication; the numerous rapids and falls, together with the thick jungle, isolate the interior from the coast. South of this region the forest thins out into partially forested savannas and mountains with high rain forests. The climate is tropical (about 80° F.), with rainfall exceeding 100 in. on the coast but decreasing inland.

The distribution of the principal modern Amerindian tribes is marked on the map (FIG. 208); the best known of these are the Arawak, the Carib, and the Warrau, but in general the cultures of many of the tribes marked are poorly known, if at all, and the number of groups extant today and their size is very small compared with earlier times. The number of Amerinds in French Guiana has dwindled to about 300, in Surinam to 2,000–3,000, and in British Guiana to 16,000.

The principal Bush Negro tribes are the Saramaccaner, Aucaner, and Boni, with three small tribes, the Matawaai, the Quintee Matawaai, and the Paramaccaner. The Bush Negroes live mainly along the principal rivers of the true forest region of Surinam, except for 600 Boni who are located in French Guiana on the upper Maroni (Marowijne) River (see map, FIG. 211). The Bush Negroes appear to have increased slightly in recent years and now number about 22,600. See AFRO-AMERICAN ART.

ARCHAEOLOGICAL OBJECTS. Relatively little archaeological excavation has been done in the Guianas. Artistically the remains are not significant: a few grotesque heads, figurines, and effigy vessels have been found in the middens and shell mounds of the coast, as in the underground caves at Cunani on the Brazilian Guiana coast. Throughout the interior region, however, are numerous petroglyphs and a few rock paintings, usually at or near the cataracts of rivers.

Petroglyphs have been found at sites on the Kuribrong and Quitaro Rivers, on the middle and upper reaches of the Essequibo, on the middle reaches of the Berbice and Courantyne, at two places on the Camopi River, and at the source of the Maroni. Three sites in the coastal belt of French Guiana, southeast of Cayenne, are the only ones known in coastal areas. The principal petroglyph designs are animals, fish, and human figures — single or grouped, some very large — or else purely geometric patterns. The techniques employed are pecking, scratching, and rubbing; grooves are generally polished. One exceptional petroglyph shows the hieroglyph of a place that is also found in the codical art of the Mixtecs of Mexico (Dahlgren de Jordan, 1951).

Rock paintings have been found in British Guiana in the Waetipu Mountains, between Caracarai and Ireng, at Amaila Falls on the Kuribrong River, and on the cliffs of Tramen, 1,500 ft. above the Karowrieng River, a tributary of the Mazaruni. The most remarkable are the Tramen paintings: the designs, chiefly in red but some in black, with some superimposition, are figures of animals, birds, and a few human beings, geometric patterns, and numerous positive impressions of hands; they cover an area extending 2 to 30 ft. above the ground and over 30 ft. horizontally. It has been reported that the pecking of designs on rocks beside rapids is an occupation of resting canoe travelers, but the Indians know nothing of the origins of these engravings and paintings and do not appear to have any beliefs, traditions, or ceremonial practices in connection with them (FIG. 209).

INDIAN TRIBAL ART. Comparatively little is known about Amerindian featherwork, but elaborate ruffs, headdresses, hats, and coronets

(with frames of basketry or cotton bands) are made. Feathers are used purely for decorative purposes, independent of any design. An old practice in the western area is to cultivate artificially colored feathers by plucking tame birds such as parrots, then injecting various substances into their skin so as to cause a new growth of colored feathers. Painting of feathers is also common.

Basketry is usually a man's work and is very skillful; wickerwork, checkerboard, twilling, twining, hexagonal, pentagonal, crossed quadrilateral, wrapped, locked, and imbricate techniques are all used. Designs — including representations of animals and geometric patterns — on a wide variety of everyday objects are obtained either from the surface texture of the weaving or by using colored elements.

Beadwork is of high quality. Beads are made from shell, seeds, quartz, greenstone, and frequently glass. They are worked into aprons, necklaces, and armlets and are decorated with geometric and animal designs.

Cotton arm and leg bands are woven on a true loom.

Pottery is made but is generally poor in the quality of its decoration, though the coastal Arawak make an attractive white, red, and black ware for Europeans; the forms of this are either zoomorphic or copies of European dishes, cups, plates, etc., decorated with traditional linear designs similar to those found on archaeological specimens.

Flattening of the forehead and nose is considered a sign of beauty among the Amerinds. Other forms of deformation for ornamental purposes are filing of teeth and perforation of the lower lip, cheeks, and nasal septum for the insertion of ornaments. Tattooing, which takes place soon after birth, is widespread; the part most commonly tattooed is the forearm, incisions being made with animal teeth or by pricking. Body and face painting, with vegetable stains — usually black and dark red — is also widely practiced. The Arawak paint the whole body, the Carib and Warrau only the face.

Art of the Bush Negroes. The Bush Negroes are descendants of runaway African slaves, who first started escaping from the coastal plantations into the interior jungle in 1667. They were officially recognized by the Dutch as an independent people about 1772, after successfully resisting attempts to recapture them. Much of the subjective feeling engendered by Bush Negro art recalls African work, but the art forms evolved are distinctively Bush Negro. The principal African contributions are from the Ashanti, Dahomeans, and Yoruba. The Amerinds have made certain material cultural contributions, such as cotton armlets and anklets, types of basketry, and, possibly, one or two stool forms, but contact between the two cultures has been and is slight. English and Dutch crafts such as cabinet-

Surinam (Netherlands Guiana), distribution of the Bush Negroes.

making and furniture making may have provided influences, for certain scroll motifs and interlacing suggest European traditions. Today, however, Bush Negro art seems unaffected by outside influences.

The principal forms of artistic expression are found in the carving of utilitarian objects: combs, food paddles, clothes beaters, canoe paddles, stools, trays, peanut-pounding boards, drums, calabashes, and architectural accessories such as doors and lintels (I, pls. 32–37). In contrast, religious images are generally roughly hewn and ill-conceived artistically, and seem to be intended only as habitations of spirits. In addition to their utilitarian value, most Bush Negro carvings are love tokens, *sanni* or *timbeh*, made by the men for the women. Occasional intricately designed and well-finished pieces are created solely for esthetic pleasure.

The tools of the carver are limited to a machete, a kitchen knife, a nail, and a piece of string to act as a compass. Sand is used to create a highly polished surface, palm oil and smoke to darken wood. Most objects are flat, and the Bush Negro excels at low-relief work with pierced areas to enhance the curvilinear geometric motifs. He does not try to solve problems in the round but views formal problems in terms of flat surfaces to be decorated; the approach to basically cylindrical objects, such as drums, is one of low relief. Where an object, such as a stool, has several surfaces requiring decoration, the artist is concerned with carving those surfaces which are most visible, and he generally treats each surface as a separate unit of design, rather than as a related part of a whole. Carvings are enhanced by the use of decorative devices such as brass tacks, cartridge marks, and hatching; inlay, of different woods or objects, and color are rare. An exception is the canoe paddles of the Aucaner, which are painted with geometric clan symbols, usually in white, black, green, and red imported paints.

The symbolism of the designs used by the Bush Negro is frequently sexual and personal to the male donor and the female recipient. The general range of designs — which includes a few animal motifs such as the snake and an occasional human figure, and which is used on the principal parts of objects, such as the handles of combs, canoes, and food paddles — has a symbolic significance related to sex and fertility. A second range of smaller designs, placed haphazardly on objects, is concerned primarily with personal sexual relationships between a man and a woman. A man woos a woman with carvings and continues to maintain her affections after marriage by means of further gifts.

As a result of the woman's being the recipient of carvings and the man the executor (all the men carve), there is a division in the field of esthetics in Bush Negro culture. (The women are highly gifted connoisseurs.) An exception is the carving of calabashes: the men usually carve these only on the outside, with motifs from the range employed for other objects, but the interiors are decorated by the women with a different design range. This reflects once again the sex division in the artistic culture of these people.

**GUINEA.** The term Guinea designates the West African coastal region included between the estuary of the Gambia River and Cape López, which the Niger delta divides into two regions, Upper Guinea and Lower Guinea. The greater part of this region is treated under other entries (see AFRICA, FRENCH WEST; GHANA; LIBERIA; NIGERIA; SIERRA LEONE). In this article three colonial states will be considered: Gambia, whose artistic production is so sporadic and modest that it does not require extensive treatment, and the two Guineas, Portuguese and Spanish. Gambia, a tiny territory on both banks of the Gambia River, is a British protectorate, except for the Island of St. Mary, site of the capital, Bathurst, and the territory opposite it, which comprise a British colony. Gambia is bordered on three sides by Senegal, into which it penetrates like a wedge. To the southeast, Portuguese Guinea includes continental territory and the adjacent Bijagos (Bissagos) Archipelago. Since 1951 it has been a Portuguese province, administratively autonomous. Portuguese Guinea is bordered by Senegal and the Republic of Guinea (formerly French Guinea). Slightly south of the Gulf of Guinea lie the Spanish possessions; Spanish Guinea includes a mainland territory called Río Muni lying between Cameroun and Gabon, as well as the islands of Annobón, Fernando Poo, and other minor islands.

SUMMARY. Gambia (col. 213). Portuguese Guinea (col. 213). Spanish Guinea (col. 214). European settlement (col. 216).

GAMBIA. Scattered throughout the country, 1,226 circles of upright stones and 275 isolated menhirs have been counted; the stones generally are shaped like truncated cones, and the circles may be either isolated or in groups. Sometimes the circles stand on the summit of artificial earthen mounds; the menhirs, several of which have been considered phallic symbols because of their appearance, may in actuality have been altars and steles connected with the cult of the dead. The larger circles may perhaps represent the tombs of kings or distinguished personages. These monuments seem to be no more than four or five centuries old, and they may have been erected by prehistoric sun worshipers with some knowledge of astronomy, who seem to have no connection with the present inhabitants of the territory. The menhirs are generally adorned with marks, dimplelike indentations and furrows, all motifs which are found on the pottery of this period. At least a few of the circles of stones are connected with burials, since around them have been found burial objects made of pottery and iron; the pottery is decorated on the outside with impressions made by matting or cords.

The present inhabitants of Gambia — the Wolof, Serer, and Diola — who belong linguistically to the West Atlantic group (comprising the peoples of Portuguese Guinea, and several groups of Fulbe shepherds in the interior), produce no art deserving mention; among the Wolof, however, workmanship in gold and silver filigree and the handling of fur is of interest.

PORTUGUESE GUINEA. The only report of a prehistoric or archaeological discovery in the area concerns evidence of a paleolithic workshop for fashioning yellowish-gray labradorite stone found at the confluence of the Féfiné and Rio Grande Rivers in the Boé region. It is difficult to establish the period of this deposit.

Among the present occupants of the land the best artistic production is that of the Bijogo, islanders of the Bijagos Archipelago, who, especially in the past, have produced excellent wooden sculpture that falls into several categories: rather sketchy representations of fetishes consisting of a postlike figure on a pedestal, cut from a single piece of timber; and anthropomorphic figurines — female for the most part — of delicate workmanship, distinguished by the white color of the wood, the spread position of the legs, and the fact that

the figures wear the national costume of the Bijogo and their typical headdress (PL. 118). This type of sculpture, probably linked with fertility rites, is now very decadent, owing to constant demand for it by tourists. Another class consists of masks, which for the most part realistically represent heads of bulls or rhinoceroses. These animals also appear in the decoration of wooden vessels, in which they figure as handles or as decorations on the lids, and in the prow and stern decorations of the large, regal pirogues, whose sides are decorated with painted, geometric incisions, while a sculptured ox skull appears on the prow. In recent times, two forms of art, introduced long ago into the archipelago, have flowered: the decoration of gourds, which are used as receptacles, with delicate incised figures representing single persons or groups and scenes of daily life; and wall paintings of the same motifs, more fully developed, found in dwellings. From these sources it is still possible to study various aspects of the Bijogo culture and of the islanders' first contacts with Europeans, particularly sailors.

In continental Portuguese Guinea, especially in the district about Catió and in several isolated zones of Cubisecco (Fulacunda), Nalu groups numbering about 3,000 people have settled. (Most of the Nalu live in the Republic of Guinea.) Their sculpture, while including several figures o secondary deities, is mainly related to initiation rites and comprises statuettes of human or animal figures, occasionally pole-shaped, and drums supported by caryatids.

The Pepel, who live on the banks of the Cacheo River, decorate their dwellings with ornamental peaked roofs, whimsical and subtle in their variations of two principal types, conical and pointed.

Among the Mandyako, pottery, which is made by women and intended for domestic use, reaches a fairly high artistic level: the upper part of the vessel is decorated with vertical and horizontal lines, the body with incisions and bands; after the vase is fired, it is given several coats of slip. Among this tribe, as well as among the adjacent Brame and Biafada, there is a flourishing art of weaving, which produces cotton fabrics with geometric and figural decorations.

SPANISH GUINEA. On the island of Fernando Poo, site of Santa Isabel, the colony's capital, which is inhabited by the Bantu-speaking tribe of the Bubi, there have been interesting discoveries of the Neolithic period, for which it is difficult to establish even an approximate chronology but which must certainly antedate the Bubi. For

the most part, these consist of vases of varied forms, decorated with reticulate or herringbone patterns, but also bearing incisions, intaglio, impressed circles and irregular ovals, furrows, and cord designs. The most generally used forms of decoration are the zigzag; rows of circles and ears of corn imprinted by means of shells, combs, or pintaderas; furrows forming bands of parallel lines; concentric circles, either plain or arranged in garlands; and undulating furrows of parallel lines. Found in association with the pottery were stone-

working tools of neolithic type (pebble culture). The archaeological levels are slightly over 8½ ft. deep; six different phases of occupation have been recognized there.

The present inhabitants of the island produce a utilitarian pottery which is very much more rudimentary than the early type. Their most notable work of art is a peculiar musical instrument called a *leebo*, a sort of bell made from a single block of wood, with eight to ten clappers, decorated on the outside with geometric and linear motifs, some of great richness. This instrument is still made today by a few old men in the southern sector of the island.

In continental Guinea, or Río Muni, the most outstanding art is produced by the Fang group (in Spanish, the *Pamues*), who have also settled in neighboring Gabon (see BANTU CULTURES). The art of woodworking reached a very high degree of formal perfection among these people in the past, although at present it is in a period of great decadence. The early wooden art objects were symbolic in nature and essentially religious; wooden figures were carved on the boxes in which the skulls of dead forebears were conserved, while anthropomorphic or zoomorphic masks were employed by the secret societies. The masks are used today primarily in games or festivities; *biang*, small wooden masks with raffia beards, are suspended from the arm and carried during dances; other facial masks, painted white, are worn on the occasion of the *agon ntang* dance. Such masks are still in use in the vicinity of Añisoc, in the region of the Río Bimbili. In this area homage is also paid to the *malan*, a nude female idol with a high headdress of raffia, which is considered to be dedicated to a forest deity.

The Fang also make fine cylindrical, footed drums, on which geometric motifs are incised, and a sort of decorated checkerboard for a game on the order of checkers, called *song*. In the men's meeting houses, connected with the secret societies, a wooden column is often kept, on which are carved symbolic motifs and zoomorphic heads.

EUROPEAN SETTLEMENT. The only modern town that is of interest for its monuments is Santa Isabel on the island of Fernando Poo (Spanish Guinea). Founded by the English in 1827 as Port Clarence, it was later renamed Santa Isabel by the Spanish. Although it is not appropriate to speak of true town planning or architectural development, nevertheless in the 20th century Santa Isabel has taken on the aspect of a Westernized colonial center. The Gothicizing Cathedral, which stands on the site of an earlier Jesuit church, was begun in 1916 by H. Miguel and completed later by others. Santa Isabel also contains the Government Palace (1915), the Palace of the New Mission by H. Cabrera, and the Bishop's Palace. The international airport was built in 1960 after plans of J. L. Servert. Other modern towns on Fernando Poo are Banapa, with the Seminario Conciliar del Vicariato, and Bafa, with its School of Arts and Crafts (1959). Of interest are the dwellings of the Poblado de Rilaja (1958) and the church of the Poblado de Masola (1958).

**GUINEAN CULTURES.** The peoples who created the civilizations which flourished along the northern arc of the Gulf of Guinea are historically and ethnically closer to their neighbors of the north, the Sudanese (see SUDANESE CULTURES), than to those of the south, the great Bantu group (see BANTU CULTURES). Their art, however, is on the whole more closely related to that of the Bantu both in the nature of the objects (masks and wooden statues) and in the types of activity (considerable, although discontinuous, development of pottery, metalwork, and weaving). But this broad parallelism does not extend to specific styles, which are extremely varied. Although the majority of the objects known are modern, artifacts have also been brought to light in archaeological excavations, which demonstrate the high level attained in periods corresponding chronologically to the Middle Ages and Renaissance in Europe. In recent decades the traditional arts have undergone a general decline, which revival movements have not yet counteracted.

PEOPLES AND KINGDOMS OF UPPER GUINEA. From early times the west coast of Africa has been an area in cultural contact with the outside world, even if the first positive information about these lands goes back only to the medieval Arabian geographers and their voluminous geographical, historical, ethnographical, and commercial documentation on the new lands reached by their caravans. The name Guinea, whose origin still remains a mystery, appeared for the first time in the work of the Arabian geographer el-Zuhri (1st half of 12th cent.), who divided the Sudan (taken in a broad geographical sense) into three regions: Ginawa, that is the Guinean coast; Kukawa (Kanem-Bornu); and el-Habesha (Ethiopia). In a 14th-century document the name reappears as Ganuya, while later Leo Africanus (b. Granada, ca. 1485; d. Tunis, after 1554) mentioned a kingdom of Gheneoa or Ghinea. Probably the name is derived from Ghinea (or Ginnie, Genni, Djenné), a city and kingdom of the Niger basin founded about the 8th century and made famous by merchants' reports, but it could also have stemmed from Ghana, the oldest empire known in western Sudan — not to be confused with the modern state of Ghana.

In the 15th century Portuguese ships began increasingly to frequent the landing points of the gulf, establishing garrisons and commercial bases. They were followed by the English, Dutch, Danish, and French. The reports of their impressions of the new countries are a valuable source of information.

Since their discovery the "great" states of the Gulf of Guinea, surprisingly advanced in the heart of a generally barbarian environment, have presented a vexing problem to European observers. The best solution at the time seemed that of attributing their genesis to external influences: from the eastern Mediterranean, ancient Egypt, the Nubians of Meroë, or more imaginatively, the lost continent of Atlantis, of which these kingdoms were thought to be a remnant. Little attention was paid to the hypothesis that they might be of African origin, the result of specific historical and economic conditions, although admitting considerable cultural contributions of foreign origin. The question is still open, but hypotheses lacking in scientific foundation are being replaced by an ever greater development of analytical investigation of the political and social structure, of economics, and of art. In this latter aspect, recent archaeological excavations have led to important new conclusions. Today there is a tendency to maintain that the early Guinean civilization was principally conditioned by economic factors, rather than, as long believed, by imperatives of a religious nature. The art of Ife, for example, cannot be considered independently of the economic environment in which it rose and flourished, an agrarian civilization in the age of metals. In the first five centuries of the Christian Era, food plants of Malaysian type (igname, oryam, banana, rice, taro, etc.) seem to have spread by a continental route along the coast of Guinea, making possible a sedentary agrarian economy, with a consequent increase in population. On the other hand, ever since the centuries immediately before the birth of Christ the Guinean regions have had commercial relations with Mediterranean Africa by way of the Sahara. The use of metals and other external cultural contributions which transformed the aspect of the rural community, eventually favoring the formation of despotic states, reached them via this route. In many centuries of evolution (the formation of the Guinean kingdoms goes back to the period between the 12th and 16th centuries), the indigenous communities assimilated external influences, reworking them in an original way so as to make them their own. Thus there arose states and cultures of an African type, which varied in territorial spread and technical levels but were all characterized by an agrarian economy and a knowledge of metallurgy.

During the period known through archaeological investigation a more developed and perfected artistic production was reached in those states which, aside from local differences, all had the same general makeup. A prime example is the state of Benin, founded in the 12th century. Between the 15th and 16th centuries it subjugated most of the neighboring tribes, extending

Stylistic areas and archaeological sites of Guinean cultures (tribal names in slanting capitals). *Key*: (1) National boundaries; (2) tribal arts of Senegambia and Portuguese Guinea; (3) sculptural styles of the southwest; (4) Dan styles; (5) eastern Guinean and Cross River arts; (6) archaeological sites. on the west to border on Dahomey and on the east as far as the Niger. In Benin, capital of the state, resided the king with his court and large harem. The sovereign personally directed the ritual ceremonies of state and supervised the administration of justice. The queen mother, the principal wife, and the oldest son of the king — heir apparent to the throne — held positions of particular prestige. A complex administrative hierarchy assured the functioning of the state apparatus by means of *corvées*, semiannual tributes, fines, commercial monopolies, and war booty. The affairs of ordinary and extraordinary administration were decided by two different councils of ministers, the first composed of the six governors of the principal provinces and the heir apparent, the second consisting of these with the assistance of 18 city chiefs and 29 palace functionaries. Even this powerful bureaucratic machine would not in itself have sufficed to assure the continuity and stability of the kingdom. The true force of the Benin and similar west African kingdoms (Yoruba, Ashanti) was war, expansionistic and predatory in character and conducted by trained armies which, equipped with metal weapons, easily defeated the weaker and more backward neighboring tribes who were still living in the Stone Age. It is interesting to note that the best art was produced in the period of maximum expansion and consolidation of the Nigerian kingdoms.

The states which were never very large territorially were no less bureaucratically organized than the greater empires and, like them, had a strongly warlike and expansionistic character. It is sufficient to recall the three Wolof kingdoms of Walo, Kayor, and Baol, ruled by a single monarch with the title of *bur*; the strong Temne state of the Sierra Leone, with which the Portuguese had contact in the early 16th century and which survived until the late 19th century; the military and despotic kingdom of the Dahomey Fon, purely Negro in origin, whose great expansion in the 18th century was favored by the slave trade, which it monopolized for more than 150 years.

The populations of the Atlantic coast and forests, from Senegambia to the Cross River, are predominantly of Sudanese race, with occasional infiltrations of Hamitic groups (Fulbe). Their languages, however, belong to various groups (West Atlantic; Mande, Kwa, and semi-Bantu, as well as such isolated linguistic groups as the Kru). Their economy is mainly agricultural; the raising of livestock is secondary and is combined with the hunting and fishing they have always practiced. Notwithstanding the leveling action of Islam and the strong European acculturation, the social and political structure is still quite diverse today; Upper Guinea still is — as it was in the past — the classical area of secret societies which, under different names but similar constitution and aims, are found from Portuguese Guinea to Nigeria.

CULTURES OF THE PAST OF THE GULF OF GUINEA. *Origins.* Archaeologists and scholars of African civilization are faced with various problems, still unresolved, about the origins, period, and external influences of the greater part of the finds brought to light in countries facing the Gulf of Guinea, particularly in Ghana, Dahomey, and southern Nigeria. Independent centers of production seem to be indicated for the stone sculpture, including the great megaliths. It is, in fact, difficult to relate the steatite statuettes of western Guinea and the stone thrones of the Yoruba to the megaliths of Senegambia or to the figurines and mutilated heads of Esie (PL. 117). Ivory working in Benin is unique — of unequaled perfection and delicacy — while metalwork and clay sculpture, at least so far as is known, have more points of contact.

Although the knowledge of metals goes back to the pre-Christian period, the working processes seem to have been acquired much later, approximately between the 10th and 12th centuries. To this period, according to several authorities, should be assigned the oldest smelting furnaces and slag deposits. Binding evidence for the confirmation of these hypotheses, however, is lacking. The introduction of the "lost-wax" process, with which bronze, brass, and occasionally gold were cast, probably spread from a single center, northern or eastern, in a period prior to the arrival of the Portuguese. Although it is difficult to establish how this technique spread, its introduction by the Europeans during the Renaissance seems to be definitely excluded, since archaeological finds place it prior to the arrival of the white man. It remains uncertain whether the lost-wax process was acquired by a single west African people and transmitted by them to other areas, or whether there were several independent centers of diffusion, as the various stylistic and technical diversities seem to demonstrate. Facts do not seem to support the assumption that all African lost-wax metallurgy is only an epigonal derivation of that of Ife. This could probably be true only for the early Nigerian civilizations with which there are noticeable stylistic and technical agreements, but the metallurgy of the Ashanti, Baule, and Dan-Ngere, as well as that of the groups of the Cameroons Grasslands, seem to have an independent origin and development. Production in the latter groups began much later and has continued up to present times; it therefore more properly concerns the contemporary cultures which will be dealt with below.

So far, with little known of the ancient culture of Ife and even less of those of the other Nigerian centers — Nok, Tada, Jebba, Esie — it is impossible to establish whether the undeniable stylistic ties in their art were the consequence of a similar historical development which, at a certain point, resulted everywhere in favorable conditions for the birth of the art, or whether the Ife style instead branched out among the neighboring peoples. An authoritative example appears to support the latter hypothesis. Precise information of a historical kind (see below), as well as stylistic and technical considerations, seem to prove that Benin derived from Ife at least the technique of its perfected metallurgy, that is, the lost-wax system of casting bronze and brass (see NIGERIA). It is still difficult to ascertain whether the cultures of Ife and Benin (and consequently their art) were the product of several centuries of evolution or the work of a few generations. In any case recent archaeological research has demonstrated the existence of long cultural sequences. In 1957 Goodwin, excavating in the ruins of the "palace" of Benin, brought to light a series of clay remains which it has been possible to fit into a long sequence; on the other hand, the palace itself showed no fewer than four successive occupation levels. In the same year Willett collected about 30,000 clay vases of the present Yoruba in the neighborhood of Ife. These turned out to be extremely useful for a comparative study (still in an experimental phase) of the Ife work in clay, according to a chronological succession.

Many Europeans scholars, noting the vigorous naturalism of the Ife works found prior to World War II, upheld the outside origin of the art, on the sole basis that the African societies through the centuries had produced only "abstract" works of art and that therefore a naturalistic concept of art was foreign to the African mentality. This seems an error, in view of the fact that successive discoveries of Nigerian art have demonstrated the coexistence of naturalistic and abstract styles, occasionally in the very same object, such as the bust of the Oni (PL. 107), in which the realistic treatment of the features and of the whole head is countered by negligent modeling of the body, which is out of proportion to the fullness of the head and is buried under a plethora of ornaments. Moreover, the excavations conducted by Bernard Fagg in Abiri, a locality some 10 miles from Ife, have brought to light in the same tomb five clay heads, two of which are strongly stylized while the other three present the delicate naturalism of Ife. A similar phenomenon was encountered in the Nok culture, one much older than that of Ife.

Even if the art of Ife, in its maturity and formal perfection, seems to represent a unique development in the larger context of the Guinean culture complex, it cannot be considered apart from the work of the other cultures of central east Guinea and Nigeria. When these cultures at a certain point found themselves under the stylistic and technical influence of Ife art, the connection is as clearly recognizable as is its absence.

Northern Nigeria, both geographically and culturally, belongs to the orbit of the Sudanese cultures, but its archaeological tradition must apparently be considered in conjunction with that of Ife. Above all, a small but important group of bronze

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

sculptures must be taken into consideration. Belonging to two or more styles, the pieces are preserved in two Nupe villages, Tada and Jebba, on the banks of the middle Niger. In the first village was found what is regarded as the most important metal statue in all west Africa, a seated male figure about two-thirds life size. Although the features have been almost completely obliterated by centuries of ceremonial rubbing with sand and water, and the hands and feet have been lost, the statue is clearly recognizable as a product of the classic style of Ife. It differs, however, in the extraordinary freedom and looseness of the pose, quite different from the canons of rigid symmetry which are almost the rule in African sculpture. This figure, preserved in the small and almost inaccessible village of Tada, is intimately connected in the minds of the inhabitants with the well-being of the country. On the other hand, the great standing male figure and the three female statuettes of Jebba, also in bronze, are not readily related to the sculptural style of Ife but seem to conform more closely to African esthetic conventions. Not to be excluded is the possibility that the style of Jebba represents an emanation of the culture of Idah, the metropolis on the Niger, capital of the Igala group, which long ago seems to have been a rival of Benin. The Nupe kingdom was founded toward the middle of the 15th century by the culture hero Tsoede, king of Idah. Driven from the throne, Tsoede supposedly fled along the Niger, abandoning those precious sculptural works along the way. Tradition and internal evidence seem to confirm this hypothesis.

But it is above all in Benin that the fruits of the Ife school can be discerned. This warlike civilization with a strongly centralized power was without parallel among the Edo peoples. The closest similarities are found in the kingdoms of Dahomey and Ashanti. The warlike character of this society and the pomp of court life provided a powerful stimulus for an art commemorating the historical events of the city, especially of its dominating class, with a certain tendency to distortion or idealization of the events, according to the interests of the various rulers. It is probable that two different artistic traditions coexisted in Benin: plebeian, executed mainly in perishable materials, which has been almost completely lost, and courtly, expressed in bronze and ivory. Ever since the technique had been introduced from Ife, workers in bronze had been prohibited from working for anyone other than the king. Consequently all the works produced remained inside the walls of the "great palace," with the exception of a few pieces given by the sovereign to officials and vassals, which have remained in the possession of their descendants up to the present.

Conforming to tradition, commemorative heads of deceased obas were made in Ife under the aegis of the Oni of the city, the spiritual leader of the kingdom of Benin (see below). The possibility that the Bini were acquainted with the working of metals, however, before the introduction from Ife of lost-wax casting methods is not excluded. Among the many surviving bronze heads of Benin one type is generally accepted by scholars as the oldest. On the whole these works are naturalistic, but certain features such as the ears and nostrils tend to be stylized and the metal is extraordinarily thin. The heads do not seem to be imports from Ife but rather of local manufacture during the first two centuries of the Bini artistic activity, a period which ended when the first contacts with Europeans took place in the late 15th century. Their derivation from Ife is much more evident than is that of the works of later periods. In the late 16th century a real artistic revolution must have taken place as a result of political changes. To this era belong both the famous plaques which adorned clay columns and piers of the royal palaces and the massive figures of musicians and other personages, whose common characteristic is their great weight —in contrast to the works of the earlier period. This trait may be related to the large-scale importation of metals from Europe. A number of stylistic changes accompanied this technical variation: a strong tendency to uniformity of the features and an accentuation of such decorative elements as necklaces and headdresses, under which the features and the body are almost completely hidden.

Once the period of conquest had passed, the internal political situation became stabilized in a pattern of hierarchical bureaucracy. The arrival of the Portuguese may have instituted artistic transformations resulting in work that is inferior to the older production (ca. 1350–1550) to which the famous portrait heads can be assigned. In effect, with the arrival of the Portuguese in Benin, new artistic themes — representations of Europeans in civilian and military dress — and new forms were introduced. These new shapes are found particularly in ivory objects such as boats, bowls, coffers, and boxes, which are decorated with geometrical motifs of Western derivation. It must be supposed that the Europeans, in addition to inspiring the new forms, commissioned these specific types from the Bini. Real decadence began late in the 17th century and lasted throughout the following century. Bronze was gradually replaced first by brass and finally by wood, and the naturalistic style of Ife was submerged beneath a plethora of ornaments. While Benin ivories (see below) were known in Europe from the period of Portuguese exploration, the bronzes remained unknown until the British punitive expedition of 1897. Only then, when museums acquired numerous pieces, was the art of Benin made accessible to a larger public.

The art of Ife became known even later, first through the few heads, mostly clay, found in that city by Leo Frobenius (1910); the main discoveries took place in 1938, in the course of a chance excavation which brought to light 11 bronze heads and masks of surprising beauty. These were followed by exceptional finds of small clay heads and fine busts and whole figures cast in bronze.

It is to be hoped that future discoveries in other localities of the Guinean area will clear up the chronological, technical, and stylistic problems for which even a tentative solution would be premature.

*Megaliths and stone sculpture.* Groups of stones standing in a circle and isolated monoliths, some of which bear enigmatic grooves or vaguely anthropomorphous engravings (see GUINEA), have been found in various areas of the Gulf of Guinea (west coast of the Gulf, Sinesalum, Casamance, Dahomey, and Nigeria). Because of the scarcity of precise data about the meaning and age of these megaliths, some scholars consider them the vestiges of altars or temples of an ancient sun cult, while other archaeologists attribute a phallic symbolism to them. The latter hypothesis still awaits confirmation but correlates surprisingly with that proposed for similar, and more clearly phallic, monuments discovered in the Cushite area of southern Ethiopia (see CUSHITE CULTURES).

It is not yet known whether artistic relationships existed between the various countries in which the megalithic monuments are scattered or whether they have a single place of origin such as Ife, the most important center for the working of stone in all of western Africa. But the great monoliths of Oranmiyan and Ogun, although they constitute pilgrimage centers, do not seem to present particular connections with those of the countries to the west.

Much more important from an artistic point of view is stone statuary. The anthropomorphic (more rarely zoomorphic) steatite figurines are unique and topographically limited in production. Since the inhabitants of the countries in which they are found know nothing of their origins or real significance, they were probably created in a fairly remote period. Given certain of their anatomical characteristics, however, it is not improbable that they were related to fecundity and fertility cults. Such statuettes, of small dimensions (max. ht., 10 in.) are still occasionally found among the Kissi peoples in the Republic of Guinea, where they are known as *pomdo*, and in Sierra Leone among the Mende (Mendi), who call them *nomoli* or *nomori*.

Among the Kissi and the neighboring Lele and Lunda the steatite figurines are at present used for divining purposes, since they are thought to be in contact with ancestors who try to return among the living. A similar belief also seems to exist among the Mende.

In certain magical rites of the Kissi the *pomdo* are used as a substitute for the human victim. Since they are ancestor

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

images, moreover, they are objects of a very active ancestor cult which is the basis of the Kissi religious life. For this reason most of these statuettes are found on tombs or abandoned sacrificial places and on the summits of low tumuli. In considering the steatite statuettes as ancient objects, it should be noted that several of the anthropomorphic *pomdo* present attributes alien to the present population, such as beards cut in the eastern mode and particularly elaborate hair styles. It is a fact that today neither the Kissi nor the Mende work stone.

Proceeding eastward, important evidence of ancient stone sculpture has been found in Esie, in the province of Ilorin, Nigeria. There, in 1934, some 800 small heads and statuettes, mostly mutilated, were found in a clearing in a palm grove. They were carved in stone and show a great variety of physical types (PL. 117), some so individualistic as to be considered portraits. Moreover, many of the tribal marks with which they are decorated are still in use among present-day peoples. The naturalism of the Esie statuary, ingenuous and typically African, is highly original in character. According to William Fagg, only one of the heads, probably of foreign origin, displays any likeness to the vigorous naturalistic style of Ife.

Finally, from Ife come beautiful monolithic stone stools (in granite, quartz, or quartzite) consisting of two disks joined by a cylindrical pillar. Some of these stools are furnished with a single lateral handle which connects the edge of the upper level with the supporting pillar. Nothing is known of the origin and significance of these objects, but it is not improbable that here, as in other Guinean countries (Ghana, Dahomey) they were an attribute of royalty (see FURNITURE).

*Metalwork.* The masterpieces of indigenous African metallurgy, the wonderful bronzes of Ife, remained completely unknown, not only in Europe but also locally, until very recent times. In 1938 a single excavation in Ife brought to light seven magnificent heads, and four more were found at a nearby archaeological site. Some of the heads have small holes symmetrically arranged in the lower part of the face and along the hairline, presumably for the insertion of beard and hair (PL. 109). Other heads have longitudinal grooves which represent the lines of tribal scarification, still used among the Yoruba. The insertion in bronze heads of hair and beard made of human hair or plant fiber was known to the ancient Egyptians and, according to the experts, is proof of the autochthonous origin of the art of Ife. Another head (PL. 115), whose face is decorated with the characteristic facial scarification marks, wears a low crown in the shape of a frontal band with a jutting ornament at the center, probably of a phallic nature, which has analogies to the frontal ornament used by the Kafficho and Konso warriors of Ethiopia (IV, PLS. 88, 89). This head, which is in the British Museum, is probably a portrait of Olokun, wife of Odua and mother of the second Oni (king-priest) of Ife, Obalufon I. In fact, it seems certain that all the Ife bronzes, including the rare full- or half-length figures dressed in the ceremonial dress of the Oni (PL. 107), are portraits, more or less idealized, of chiefs or important personages. They may have been executed posthumously to be employed as substitute figures during funeral or commemorative ceremonies.

In comparison with the classic naturalism of Ife, the later metalwork of Benin and other Nigerian centers seems considerably inferior. According to tradition, Benin craftsmen learned the technique of bronze and brass casting from a Yoruba master foundryworker from Ife, a certain Igue Igha, subsequently worshiped as the divinity of the Bini founders corporation. More specifically, the Oba Oguola of Benin is said to have sent a messenger to the Oni of Ife about 1280 requesting an expert founder, so that bronze and brass objects could be produced in Benin without having to import them from Ife. Metalwork was necessary to commemorate the historical events of the city-state. Today it seems certain that the bronze of Benin was produced by court craftsmen who worked at the orders of the sovereign.

Only a few metal objects — the round bells with extremely thin walls — can be attributed with certainty to the early, or archaic, period. This phase, which seems to have extended from the second half of the 12th century to the first half of the 14th century, was followed by the period called "classic" (ca. 1350–1500), to which the most beautiful male and female portrait heads are attributed. Those probably representing young princesses are outstanding in originality and realism and can be enumerated among the masterpieces of Negro art (PL. 111). These heads have a characteristic upswept hairdress, in the form of a high cone, which most likely was supported by a fine network of corals, realistically represented in bronze.

The working of bronze and, above all, brass reached its apex under the reign of Esigie (ca. 1504). The best of the celebrated plaques (PL. 113; IV, PL. 20) were produced at that time, with scenes taken from court life, from festivals and ceremonies, and with personages such as the Oba himself and the great dignitaries of the kingdom, accompanied by courtiers or carried by slaves. The massive bronze heads, stylistically quite different from the refined heads of Ife, also belong to this period. There were also statuettes in the round, occasionally equestrian, representing important personages of the kingdom, or Europeans in the sumptuous costumes of the period. The last artistic period, the period of great efflorescence, lasted throughout the 16th and 17th centuries.

The bronze figures discovered in Tada, a rather inaccessible village on the right bank of the Niger, seem to be related to the style of Ife, in particular the beautiful reclining anthropomorphous sculpture (see above). Three other human figures were also found (two quite small), one of which clasps its hands in a symbolic gesture, considered typical of the Ogboni secret society, which is widespread among the present Yoruba. But these figures are quite crude, and their style recalls the recent Yoruba brass production rather than that of Ife. The fourth figure, called *gara*, is considered so sacred that it is never carried outside its hut. It is richly robed and wears bronze ornaments decorated with geometric motifs. On its forehead the statue bears a disk, part of a rich headdress which hangs down its back. In the center is the gorgonesque motif of a horned human head from whose nostrils serpents issue. In Tada three zoomorphic figures — two ostriches and a small elephant — were found. Their style is unrelated to that of other parts of Africa.

Jebba, likewise a village of the Nigerian Federation, has yielded two bronze figures which are related to the figure with joined hands from Tada; together they form a stylistic group influenced by the two traditions of Ife and Benin. They seem to be objects from a single foundry.

*Benin ivories.* A characteristic art of Benin which, in part, reveals European Renaissance influences, is the carving of ivory, which often reached a high level in fineness of execution and expressive realism. The range of production comprises elephant tusks completely covered with a spiral carving of subjects of courtly or military character or lively genre scenes; coffers, cups, and spoons, of evident Renaissance derivation, the decoration of which consists of geometric-symbolic motifs and naturalistic figures (VIII, PL. 250); fine ivory horns; small anthropomorphous masks, some exquisitely executed (PL. 112); bracelets decorated with zigzags, spiral bands, and various geometric motifs; and finally human and animal figurines in the round, which are comparatively realistic, as in the case of the leopard in the British Museum whose spots are inlaid metal disks (PL. 114). Probably many ivory objects were executed according to Western designs at the request of Portuguese merchants, even though the objects, taken as a whole, present a fundamentally African character.

Ernesta CERULLI

*Clay sculpture.* Ancient examples of ceramics, beginning with the Neolithic age, have been found everywhere in the Guinean countries in the numerous workshops for stone implements. These are generally small fragments, but their faces bear ornamental designs incised with a burin or impressed with a rope pattern. It is surprising to discover in this ancient evidence the techniques used today by African potters; indeed, the utilitarian pottery of the Gulf of Guinea does not seem to have progressed noticeably from this early stage. However,

from remote times relatively advanced cultures with an excellent artistic production have existed in the Guinean area, particularly in Ghana and Nigeria. In Gambia large open funerary urns, with striated and cord-marked surfaces, have been excavated on the sites of ancient stone circles, which are attributed to a period between the 8th and 13th centuries, although they are considered by some authorities to be much more recent. In the Ivory Coast, the Anyi (Agni) of Krinjabo, near Aboisso, used to employ in the course of funerary rites, heads, busts, or complete figurines called *ma*, artistically modeled in clay; some of these are decorated in an extraordinary way.

The oldest identifiable high culture is centered at Nok (Plateau and Benue provinces) in northern Nigeria, where a series of remarkable clay heads and human and animal figures have been excavated in geological deposits dating from about 900 B.C. to A.D. 200. Geographically this area belongs to the Sudanese civilizations (see SUDANESE CULTURES), but its artistic styles are connected to the great art of Ife (see below). The human heads are modeled in a distinctive quasi-naturalistic style of real artistic merit; the peculiar treatment of the eyes with staring hollow pupils conveys an expression of intense concentration. Children's heads and elephants and other animals, admirably modeled, form part of this art complex, which is still little known. The Nok culture had become extinct by the beginning of the Christian Era.

The numerous clay heads of Ife, which are attributed to a period between the 8th and 15th centuries (and certainly are not later), mark the culmination of naturalistic art in Africa and have little in common with the various traditional stylizations which characterize most African sculpture. The heads, serene and dignified in expression, are clearly differentiated portraits of individuals and vary in scale from miniature to more than half life size; many of them originally had bodies of which fragments remain, but no figure has been found complete. Like the well-known bronzes of the same culture, they are modeled with consummate skill and fidelity to nature. Indeed, there is nothing primitive about them, and they will bear comparison with the masterpieces of the highest civilizations. Only in the treatment of the eyes and ears do they show a slight degree of conventionalization, and the style is so consistent as to suggest that all the clay sculpture and the bronzes are the work of a single artist or school of art. They seem to represent the peak of a long tradition, but the source of their inspiration, whether local or foreign, remains unidentified; no traces of earlier stages in the evolution of the art have been discovered. The people portrayed appear, however, to be the ancestors of the present Yoruba, since they depict the same mixture of Semitic, Hamitic, and Negro types which is characteristic of that group today. Some of the heads are covered with facial scarifications or raised weals such as can be seen among tribes living in northeastern Nigeria and Bornu (PL. 108). By analogy with the bronze figures, some of which are shown wearing the royal insignia of the Oni of Ife, these heads would seem to relate to secular rather than religious art, although they may be connected with ancestor worship. Their original purpose is not known, but until recently some of them were preserved and venerated in sacred groves, though most of them are now in the Ife museum (PL. 107).

Among the surviving works of art from the 15th to the 17th century from Benin City in southern Nigeria are a few small clay heads (ht., ca. 6 in.), which are modeled in the same style as some of the finer early bronzes. The portraiture is less completely naturalistic than that of Ife, though probably inspired by it; a peculiar feature is the inlaying of strips of iron to indicate the pupils of the eyes and the nasal scars. A few larger heads are direct copies of bronzes of the 18th or early 19th century, showing a considerable degeneration from the older style.

In southern Ghana and Ashanti a good deal of fragmentary pottery has been excavated at various ancient sites, apparently antedating the early colonial period of the 16th century (e.g. Nsuta and Tarkwa near the coast, Obuasi, and Abodom). Much of it is extremely ornate and the style of decoration is quite distinct from that of the modern local wares. It consists chiefly of incised, impressed, or combed linear designs, herring-bone bands, punched circles and ellipses, small appliqué bosses, and occasional figures in relief. The rims are often deeply undercut and prominent flanges are modeled below them. This pottery seems to have been chiefly domestic and shows no trace of having been painted; it is often found associated with stone celts and the remains of an embryonic iron industry.

In some parts of Ashanti and the coastal region (Fomena, Wassau) clay heads, almost life size, were placed on burial sites as abodes for spirits of the dead. The features are somewhat stylized, but certain details such as noses and curls of hair are more realistic, and the general effect is often vigorous and lifelike. The manufacture of these heads ceased only about a century ago. Another type of small funerary head at Agona-Swedru has a ringed neck and flat face, resembling that of the Ashanti dolls called *akua'ba*. Funerary equipment also includes jugs, "tazzas," and ring-necked vases. Very few complete specimens of early pottery have survived in Ghana or Niegria; some of these have rouletted ornament.

Hermann J. BRAUNHOLTZ

CONTEMPORARY CULTURES. The forest, almost nonexistent in Senegal, thickens progressively though not evenly along the Gulf; it forms a more or less continuous cloak of vegetation in Casamance, and, after many interruptions, reappears in its full density in the Ivory Coast. The innumerable species of trees found in these forests have favored the development of a remarkable art, wood sculpture, which is the highest vehicle of esthetic expression for certain cultures in this area. The whole interest of the Guinean artist seems centered in the creation of objects for ritual use, such as the mask and the statue. Because climatic conditions in the Gulf of Guinea are unsuitable for the conservation of wooden objects, nothing remains that is really old. With a few rare exceptions, the works in museums certainly go back no farther than two or three centuries; most collections are no more than a few decades old. This period, of course, corresponds to the time when Europe, beginning a spiritual revolution, discovered Negro art as one source of a possible renewal.

Estheticians are fond of declaring that since the African natives began to adopt Western models, the art of wood sculpture has begun to decay. The sociologist, however, prefers to speak of an "evolution." Although modified in its forms and in its spirit, this art is still very much alive in the Guinean area but is steadily being transformed from an art into a craft. The penetration of Islamic thought, which has made itself felt on the west African coast since the Almoravid expansion of the 11th century, has generally impeded the development of the native art and has even stopped it completely in certain cases. Naturally, the situation is also influenced by other psychosociological factors which can act as negative catalysts in the area of artistic creation. An example is the Arab-Berber taste for decorative detail which has steadily infiltrated the naturally robust forms of Guinean art.

The Arab script, introduced by the Islamic culture, has encouraged the development of calligraphy. However, this art remains almost exclusively the specialty of copyists of the sacred books, certain pages of which bear ornamental designs of Oriental inspiration. This art flourishes here and there in some Islamic schools of higher learning (madrasah), aided by the presence of an imam or some other influential religious dignitary. In the Koranic schools in the principal centers of Moslem expansion on the west coast of Africa, the little Negro students, like their Arab counterparts, in learning to recite the suras of the Koran use wooden tablets which often reveal a subtle and refined sense of art.

The influence of Oriental decoration also shows itself in other sectors of social and economic life, above all in architecture. The mosques, the houses of chiefs, and other public buildings often bear a clear Sudanese imprint. Throughout western Africa, which was formerly faithful to the traditional religions, the Islamic doctrine seems to be gaining ground, in spite of the rather unsystematic opposition of the Christian missionary movement. These two religions hinder the development of genuine Negro-African sculpture, which they judge savage or

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

pagan, but they sometimes give rise to local craftwork of an enervated appearance that is not always very happy from the esthetic point of view. Examples are the little iron figurines from Ouagadougou (Upper Volta), some of the objects in copper, wickerwork, ivory, and leather made by the craftsmen of Bamako (former French Sudan), and the statuettes in brass from Zagnanado (Dahomey), which are carried throughout the Guinean area by traveling Diola and Hausa merchants and are destined for the tourist trade.

Throughout western Africa it can be seen that, without exception, the extent of local art corresponds to the degree of conservation of traditional institutions. Indeed, since the abandonment of their traditions, none of the modern societies of the Gulf of Guinea has been able to create a substitute art. All these societies in movement, absorbed by their efforts at acculturation and by the reorganization of their political and economic structures, have been able only to imitate, borrow, and assimilate foreign values for the elaboration of a new esthetic. In comparison with the old masterpieces of Negro sculpture, the contemporary production makes a very poor showing.

*Tribal arts of Senegambia and Portuguese Guinea.* Senegal, a rather arid country of subdesert type, is today largely Moslem, a fact which gives a distinctive character to its peoples, although a significant minority of the rural population remains faithful to the old religious practices. The oldest inhabitants of the Cape Vert Peninsula, the Lebu, who live on the "Little Coast" near Dakar and Rufisque, support themselves by fishing and by agriculture. Today the Lebu form a relatively mixed ethnic group; they are basically Mande-Susu, but there has been considerable mixing with the Serer and the Wolof. The prows of the Lebu pirogues are often decorated with geometric designs in painted relief which are of little artistic interest. This is true also of the Wolof pirogues which are used all along the coast from Ngor and Yoff to the "Tongue of Barbary."

Another Senegalese tribe, the Fulani of Fouta Toro, are for the most part Moslem pastoral nomads. Their way of life has not permitted the development of any art worth mentioning. However, a group of Fulani craftsmen known as the *laobe*, who correspond in many ways to a caste, specialize in wood carving and make everyday domestic utensils such as dishes, ladles, spoons, and various chairs and stools which can always be seen in the markets of the big towns; they also make drums and similar objects. Many *laobe* today work in Dakar for a European clientele, and their products, often of poor quality and taste, are sold all along the coast to Abidjan; typical are the roughly varnished wood sculptures, the ornamented stools, and lamps imitating Western models. The Tukulor (a corruption of the Arabic name "Tekrur"), pastoral Moslems who live on the banks of the Senegal River, have created no noteworthy art.

The most numerous population of Senegal, the Wolof (ca. 850,000), are Moslems who maintain archaic beliefs side by side with Moslem practices. The Wolof have an old political tradition; their society, which is extremely hierarchical, is composed of many strata, fairly separate from one another, which are somewhat like what we call "castes." The caste, or *tegue*, of metalworkers and jewelers is of interest because it produces traditional jewelry as well as modern filigree work. The *oude*, whose members are shoemakers and saddlers, makes leather boxes for the innumerable talismans carried by both sexes. The Wolof woman adorns herself with large pieces of showy jewelry of "fetish gold" and wears elaborate coiffures and brightly colored clothing. The Serer, living to the south of the Wolof, are an agricultural population attached to their traditional beliefs, and therefore resistent to Islam. Their artistic creation is of poor quality (see AFRICA, FRENCH WEST).

In the interior of the Casamance — politically a part of Senegal but forming an ethnographic unit with Gambia — live other groups of Fulani who are superficially Moslem but continue to practice cults that, although probably very old, are still only slightly known. Along the coast are established communities of the Mande and more especially of the Diola, while along the river Casamance are the Diola and the Felupe, both excellent rice growers.

The only artistic works worth mentioning in this area are the vases for cooling water, with two spouts joined by a small twisted handle, similar to those of the Yoruba (see below), and also found among the Mende (Sierra Leone). This type of vase probably has a Spanish or Portuguese derivation; some examples are painted with curvilinear motifs in red or are stamped with decorations based on plant forms.

The Bayot of Portuguese Guinea are closely related to the Diola, with whom they have many customs in common. Like the latter they show incomparable ability in building great communal dwellings intended to house all the members of a family (using the term in its broadest sense). They contain many rooms, so that each family unit may lead a separate life. Among the oldest inhabitants of Portuguese Guinea are the Balante, the Pepel, the Mandyako, and, best known, the Bijogo. Traces of the matriarchal system are found among these tribes, who are rice growers and excellent boatmen. The Balante and Pepel societies are firmly organized and stratified into classes according to age. The ceremonies which accompany the transition of young people from one class to another are spectacles with astonishing choreography, rich in color because the taste for clothes and personal ornament is highly developed. The weavers of the Balante, the Mandyako, the Bram, the Biafada, and the Banyun are deservedly famous for loincloths and coverings ornamented with beautiful geometric or figural designs. Such fabrics, mainly intended for export, can be found in the markets of Dakar and other places. The walls of dwellings are often covered with paintings which contain a rich variety of motifs and combine keen observation with a strong decorative sense.

Owing in part to their natural isolation, the Bijogo, who are spread through the Bijagos (Bissagos) Archipelago, have a wonderfully preserved littoral civilization. In the past theirs was a very rich art in both painting and sculpture, but the gradual infiltration of European subjects has given their creations an un-African character. The paintings which decorate the walls of their circular houses are executed with mineral colors (kaolin white, and yellow and red ocher), and with motifs taken from both secular and religious sources: geometric forms, palm trees, birds, oxen, sharks, giant rays, scenes of fishing and of ritual combats appear next to those with pirogues, steamships, airplanes, and administrative officials. There is an almost religious veneration of the bull, associated with the idea of strength and of fertility; enormous masks representing a bull's head play a part in the rites, dances, and mimes of puberty. Formerly the solidly built pirogues carried powerfully executed figureheads of bulls or crocodiles on the tip of the prow. Today the wood sculpture, carried out in a very soft white wood (PL. 118), has obviously been commercialized so that it has lost its earlier simple strength (see GUINEA).

*Sculptural styles of the southwest.* The Koniagi, who inhabit the plains around Yukunkun (Republic of Guinea), and the Basari (Bassari), situated on the rocky hills of the subdivision of the same name, belong to the same ethnic and linguistic group, the Tenda. Among both these peoples clothing and headdress assume extraordinary forms; the fetes and the dances — in which masked actors such as the *ganguran*, *lukuta*, *anenere*, and others take part — are famous for their spectacular character. Esthetic feeling plays an important part throughout life and finds expression in the most personal things: coiffure, decorative scarification of the body, and even a codpiece braided in straw.

Nearer the coast live rice growers, the Nalu, the Baga, the Landuma, and the Susu. The initiation societies (such as the Simo), which were once very powerful, developed a rich and striking wood sculpture in creating such ceremonial accessories as the great statue-masks, *sili-simo*, *mbantiun*, *kakilambe* of the Baga, and the *bansundyi* (the great python) of the Nalu, which are sometimes of tremendous size. The use of masks was very common in the past, but today it is disappearing as a result of extensive economic changes. In recent years a large number of works of art, sometimes of the greatest ethnographic interest, have been exported from this area: masks, statues, and magnificent polychrome drums. Among the masks are the enormous *nimba*

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

(which may weigh more than 100 lb.), a female spirit associated with fertility rites, and the zoomorphic *banda*, shaped like a crocodile's jaws. The *nimba* and its local variants, the *nimba kupon* and *nimba pefete*, are creations of the Baga, while the *banda* seem characteristic of the Nalu, although they are constructed by Baga sculptors in the villages of Taigbé and Taĭdi, which are famous for this work. From the same region comes an extremely bizarre idol called the *atiol*, the object of a collective propitiatory cult of the rice growers. It is the effigy of a head of a bird-woman with a long beak; its features are badly defined, but it has recognizable human traits. The very stylized head, with a cylindrical neck, is mounted on a base. Under the influence of the invading Susu, the Baga and the Nalu are losing much of their ethnic individuality; with the adoption of Susu as the lingua franca, the cultural boundaries of the two groups are becoming imprecise. This fact is important, since it affects the interpretation of the function and the exact origin of certain less interesting masks which are life size and have a mainly secular use: the *koni* (also called the *tiyamba*, or the *kinson* after its inventor), which represents a bird with a long curved beak; the extraordinary and complex *sibondel* (also called a *bondi*); the *sebe-simo*, which has become the *komoe* by ritual corruption, and which represents the bust of a young woman; and the grotesque *lumbe*, *dudu*, and many others, all inspired by the innate sense of rhythm of these people and their natural inclination for the bizarre and for caricature. Compared with the multitude of masks, the statuary of this region seems rather scarce (PL. 121), but there are some statues with large hooked noses clearly inspired by the brutal features of the *nimba*. More noteworthy are the wall paintings on the interiors and exteriors of the dwellings (PL. 119).

In the interior of Guinea completely settled groups of Fulani raise their flocks and cultivate cereals such as *fonio* on the grassy slopes of the Fouta Djallon. The Malinke, formerly migratory, have settled even farther inland, and on their boundaries are former inhabitants of the area, such as the Dialonke (expelled from their native mountains by the Fulani), the Dyakanke, and the Koranko (Kuranko). Because of their conversion to Islam, all these peoples have produced little art. However, the Islamization seems fairly superficial in the peoples with a very primitive cultural level, which perhaps explains why the Dyakanke provide such a great number of metalworkers (assimilated with the sacrificers of the chthonian cults) and of potters (the female counterparts of the metalworkers).

Apart from inept imitations of the *pomdo* in a dark-hued pottery, the Kissi (see above) make only statuettes for divination and, rarely, flat masks with horns called *komo*. Among the Mende, on the other hand, there are excellent sculptors who make the famous hood masks known as *nowi*, which are said to be used by the women's cult associations called Bundu. With their amazing helmet-shaped headdresses, minutely detailed in execution, and with their thick necks bulging in heavy rings (an important functional detail), these robust Mende masks possess an esthetic appeal that is increased by the beautiful patina they develop through long use. The Mende sculptors also model slender figurines of women, characterized by long, ringed necks; the most recent of these, however, are generally less expressive.

Among the peoples of Sierra Leone, the Mende are the leaders in creating works of art; the Bulom, the Sherbro, the Krim, the Temne, and the Vai of the coast (PL. 120) have no artistic production of importance, although there are little groups of craftsmen, among the Temne for example, who imitate the Mende style to make money from tourists. In this region are found the Poro and the Bundu, the initiation organizations for men and women respectively, which direct the religious and political life of the primitive societies of Sierra Leone, Liberia, and Upper Guinea. The Poro, which requires the production of an enormous quantity of masks, statuettes, and other accessories, usually of wood, for use in its innumerable ceremonies, is one of the most important factors in the development of ritual arts in this entire cultural area. The region contains, in addition to the tribes in the interior of Sierra Leone already named, the following ethnic groups: in Upper Guinea, the Toma, the Kpelle (or Gerse), the Mano, and the Kono (who must not be confused with the people of the same name who live in the north of Sierra Leone); in Liberia, on the borders of the Republic of Guinea, there are important groups of Toma, Kpelle, and Mano; and finally there are the Ge and the Gio (who are related to the Dan-Yakuba) of the Ivory Coast.

In the course of their ceremonies, the Toma employ masks depicting the two initiating spirits, *niangbai* and *gbakologhi*, whose massive faces, sometimes prognathous, sometimes flat, occasionally fringed with the skin of a black monkey to form a beard, and often crowned with horns, are of a very distinctive type. Because of the extreme secrecy of the Toma rituals and the lack of esthetic interest of this branch of Guinean art, these masks rarely appear in collections. The masks used in Poro ceremonies of the Kpelle, Mano, and Kono have many physiognomic traits in common, so that it is possible to group them with analogous works of groups of Dan in Liberia and the Ivory Coast (see below) in a regional style. Among the Kpelle, the *nyomu*, sacred figures which are very popular, appear most often in pairs. There exist also certain less familiar masks which are reserved for exclusive rites; most important is the "bearded old man," armed with a claw of iron, who takes part in the pectoral scarifications practiced on the neophytes; another mask, with a very large jutting jaw, intervenes to ensure discipline among the new initiates of the Poro, who are secluded for a long period in the bush school. All the male masks (*nyomu*) of this cycle are conspicuous at first sight by their great projecting hooked noses; the lower jaw is often a movable piece attached to the main facepiece by vegetable ligatures. In some masks the jaw is extended in the form of a long beak shaped like that of the hornbill. The presence of a beard is not a sure way of distinguishing the sex of a mask, since frequently the *nyomu nea* (female mask), like the male *nyomu sine*, is ornamented with thin tresses of raffia. The women potters of these tribes use a whitish clay to make fine *canaris* and other utilitarian pottery, decorated with designs in black and white. The greatest variety of masks is certainly found among the Mano, above all in the Liberian group; the number of prototypes among the Kpelle and the Kono does not seem to exceed five or six at the most.

In Sierra Leone there are masks used in the initiation ceremonies of the women organized in the Bundu, but the wearing of masks, with a few rare exceptions, is strictly forbidden to them in the similar local associations known as Sande. Even the sight of a sacred mask (PL. 120) can be fatal to a woman or to the uninitiated.

Among the Kono, the use of masks is almost a daily occurrence; no social event — birth, funeral, the enthroning of a chief, the departure of new recruits, the visit of the administrator — can take place without the participation of the *nyomu*. In the beliefs of the peoples of Upper Guinea the mask is truly a materialized symbol of the transcendental world; the mask, as spokesman of the directors of the Poro, presents itself as a permanent agent charged with safeguarding and applying the unwritten common code; it personifies the moral code without which social cohesion could not be maintained; finally, it represents the Initiator who makes of the human embryo a valid social unit, whom it guides through the vicissitudes of life, protecting and punishing as needed. All this naturally works through the omnipotent organization of the Poro, whose directors always exercise a great influence on public affairs.

The surface of the wood of a *nyomu* is darkened and polished with the help of natural colorings, which give it an added beauty; the headdress and clothes, on the other hand, are multicolored and contrast with the sobriety of the face. To satisfy the requirements of the rituals the flowing skirt made of raffia fibers must entirely conceal the feet of the mask wearer, even during the frenzied whirling of the dance. Under the influence of the comic masks (called *sagbwe*) of the neighboring Yakuba, the turbulent *nyomu kpman sine* of the Kono have a scarlet fabric covering on the polished oblong face; in some cases this shrinks to a simple band at eye level, pierced by circular holes rimmed with aluminum rings.

The tiny pocket-sized masks, called *lugo*, found sometimes among the Toma and less often among the Kpelle, Mano, and Kono, are miniatures which copy as faithfully as possible the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

appearance of the great ritual masks. The *lugo* receives something of the supernatural force inherent in the original in its role as a sacred agent in the initiation rites, and it serves its owner as a source of beneficial power for his own private use; for it is personal property, unlike the large masks which are entrusted to the specially qualified wearer but belong to the group. For this reason *lugo* are the objects of a very intimate cult that is simple but permanent: one may almost say that a Kono, Kpelle, or Mano never lays aside his *lugo* without staining it with the orange-colored spittle of his daily kola nut. As a result of this treatment the little wooden masks become covered with a fairly thick coating of this substance, and further stained with the blood of sacrificed chickens, they acquire a patina which is highly prized by collectors. Other types of *lugo*, less well-known and less sought after because of their crude execution, are carved from pieces of steatite found in the rich veins in the environs of Nzerekore, in the cantons of Vepo and Lola.

Frequently represented on the incised and painted walls of the circular dwellings of the Kpelle and the Kono, the long *nyomu kwuya* is worn by the dancers on stilts, as is the *siwere-were*, its smaller and rarer variant. The dances, which were originally sacred ceremonies, today form a completely secular acrobatic spectacle that is included in all the folk dances organized for foreign visitors and European officials. The masks for dancers on stilts are not peculiar to this region, since they are found among other tribes of west and Equatorial Africa, such as the Dogon of the former French Sudan, and the Gio and the Ge of Liberia; they have a very limited geographical distribution, however. It is also possible that they were introduced among the peoples of Upper Guinea from the country of the Dan-Yakuba around Man in the neighboring Ivory Coast. There is nothing arbitrary about this supposition, for the Dan are considered the original masters of the masks used today by the tribes in question; it is a fact that certain *nyomu kono*, for example, speak or sing in the language of their Dan "initiators" during their ceremonies, although their words are incomprehensible to the majority of the laity. In the Liberian hinterland the masks of the dancers on stilts come in couples. The male partner reaches up sometimes to a great height, which requires exceptional skill on the part of the dancers; at times their conical hats are higher than the rooftops of the houses. Unlike the masks worn by the dancers on foot, which consist of a piece of wood carved into a face, the *nyomu kwuya* and the *siwere-were* simply have their faces veiled with a piece of black cloth made from vegetable fiber, from the middle of which hangs a braid representing the nose. The dancers, who have become professional strolling players, like the famous child jugglers of the Man district, roam across a huge area following the public festivals, even going as far as Abidjan. Apart from the Dan, they are recruited almost entirely from among the Ngere (Guere) and the Wobe.

West of the Cavally River, which serves as a natural frontier, the civilizations established in central Liberia and on the coast remain to be considered. From present knowledge it does not seem that these are important centers of artistic productivity; the names of the Gbanda, the Buzi, the Gola, the Bassa, and even the Vai (PL. 120) are usually passed over in books on Negro art. This is understandable, because these people have lost much of their cultural creativity by mixing with former slaves repatriated from the United States. However, although it is not very well known, the Kru and the Grebo possess masks, often of a very strange appearance, which are intended for ritual use in secret societies. Some suggest hideous, terrifying spirits, while others reproduce sensitive feminine faces and are heavily decorated with ornamental details. The Ge and the Gio have already been mentioned as related to the Dan of the Ivory Coast, and many villages in their region have become important producers of ritual objects, notably of masks (whose style recalls that of the southern Dan), and, in smaller quantities, votive or commemorative statues (PL. 121) which are very inaccessible to collectors. Further south, the Kran, ethnically related to the Ngere of Toulépleu (Ivory Coast), live in the area whose chief town is Zwedru, center of the district of Tchien (Eastern Province). The Kran have excellent manual ability and a feeling for decoration similar to that of the Ngere. Their villages always have a brightly colored appearance, which is due mainly to the fantastic and almost surrealist paintings which enliven the white walls of their huts (FIG. 233). This traditional mural art is unfortunately now in a state of decline, since in recent years the work on coffee plantations has absorbed all the interest of its former creators.

Along the course of the Cavally River on the east side are found three successive types of civilization: in the south, heterogeneous groups united by the same language or by related languages, who are known by the not very explicit name of Kru; to the east of the middle Cavally, the Ngere and assimilated peoples; and finally, on the upper Cavally and beyond toward the northeast, the Danpôme, better known as Dan and Yakuba (Yafuba).

The small groups of the Kru complex, called the Bapo, the Niabua, the Plawi (Plapo), the Yirebo, the Tewi (Tepo), the Urepo, the Grebo (Trebo), the Tribu, the Bakwe, the Kwadya, the Godye, and the Neyo (these latter living around Sassandra), are interesting only for their artistic ability. The local sculpture includes some heads of the idol *gle*, modeled in clay and without distinction, and a very few masks and statuettes. There is also a very active production of wooden combs that are attractively engraved. Much more exciting are the numerous wall paintings that show an amazing precision and technical knowledge. This is true not only of the monstrous creatures with extraordinary bodies that are part of the local water mythologies, such as the well-known woman-Hydra, or manatee, called the *mami wata*, but also of the innumerable pirogues, boats, and steamers that are reproduced in the most faithful detail.

Painting, and to a lesser degree, incised wall engraving, which are highly developed on the west coast of the Ivory Coast, are almost unknown among the related groups of the interior, such as the Godye and the Dida, as well as among the tribes of the lagoons to the east of Fresco: the Avikam, the Ajukru, the Ebrie (Kyama), the Mbato, the Evalue, the Essouma, the Abure, and the Nzima. Some minor examples appear sporadically much farther away, in the southeast Ivory Coast, among the Attie, the Abe, and the Anyi (Agni) of Indenie and other peoples of Akan origin, who are active growers of cocoa. In this last region modern motifs predominate. Mixed with garlands, palm trees, and stylized flowers are unusual compositions: for example, two boxers in combat, an elegant European woman, a splendidly equipped white hunter, or a couple of young African men in festive raiment. This repertory also includes many zoomorphic forms: a chimpanzee climbing a tree, a leopard, a lion, two peacocks facing each other in a symmetrical composition, and a huge python.

The Bete of the Gagnoa, Issia, and Daloa regions like to decorate the outer walls of their temples, dedicated to a syncretic cult known as Lalu or Deima, with expressive representations of wild animals such as elephants, panthers, hyenas, buffalo, and snakes.

*Dan masks and styles.* In the area of the great forests along the Cavally River, approximately at the level of Tai, a small tribe called the Ubi is the vanguard of an important ethnic group whose sylvan civilization is little differentiated socially. The Ngere, as well as the Wobe and the Niabua, are makers of the horrible grimacing masks which are well known to students of African art (PL. 120). Statues are extremely rare, but the few examples in museums, usually representations of women, have a savage yet compelling beauty. These tribes excel in realistic animal sculpture (PL. 118). The oppressive quality of the natural surroundings — the shadows of the forest, so conducive to supernatural apparitions; the mournfulness of interminable rainy days; the heavy and perpetual mists which weigh upon the villages and fill the inhabitants with an almost morbid melancholy; the deliriums of palm wine; the rhythm of the night dances; the elusive spirits that hide in the undergrowth, in the rivers, and on the mountain tops; the human uncertainties and fears — all are dramatically reflected in strange faces carved in wood and heightened with the most improbable attributes. It is not merely a question of naturalism, because nature is not only deliberately exceeded but deformed, twisted, and abused by

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

the artist. The result is a hideous and evil caricature of an almost apocalyptic creature which we cannot call either human or animal. It has tubular eyes, swelling and embossed cheeks, enormous ears, and a multitude of horns surmounting a large nose, and a huge mouth (or rather muzzle) with savage menacing teeth. The whole surface of the face of the mask is violently colored, and it is framed at the top by a fringe of skin from a wild animal such as panther, wildcat, civet cat, bushbuck

fering in name according to the locality but all instituted in honor of Nionswa, the supreme god of the Ngere. There are numerous rectangular mud-walled temples, which have an extraordinary apparatus for sacrificial purposes on the altar and sometimes have large effigies of Nionswa modeled in clay and decorated with vivid colors. In the public squares of the Ngere villages Wobe and Grebo, the hut-shelters, which are called *kwi* after the men's society, are sacred places forbidden to the uninitiated

Liberia, wall pictures: (*a*) Composite creature of the kind described in the water mythology, Grebo tribe (Maryland County); (*b*) mythical creature, Grebo tribe (lower Cavally River); (*c*) aquatic monster; (*d*) mythical manatee *mami wata* (Zwedru region); (*e*) mythical manatee, Kran tribe; (*f*) two missionaries with an elephant and an airplane, Kran tribe.

(especially the striped species), or monkey (in particular, black with a white tail). Below, the face is bordered by a beard which is left to the imagination of the artist and which is made of the same kind of fringe. Very often the mask is topped with a high full headdress, skillfully constructed of cloth, skin, metal, and shell, or a crown of feathers (hornbill, touraco, or eagle).

The masks of the Ngere, the Ubi, the Wobe, and except for some formal details, the ritual masks of the Niabua (which are closely related to the Bete) are carved and decorated according to a common esthetic plan. The result is a formal parallelism which can cause difficulties for the white scholar trusting to the illustrations in art books, in which uncertainties about the places of origin are often repeated. A special category of Dan masks, of similar style, also exists to complicate the situation and to lead the collector into error.

The penetration of Islam and Christianity, sometimes devastating to native culture, is slow in this remote area, where the people are scattered and relatively impervious to outside influence. The mask has thus retained all its psychological force; the only perceptible decline is the recent introduction of the masks into secular celebrations, so that the same masks which were formerly an essential part of sacrificial ceremonies are part of the leisure distractions of the young Ngere planters. Nevertheless, the masks' original role — which is certainly ritual — remains of great importance in the religious life. Though, for example, a grotesque and ridiculous *zoroa gla* collects presents and food for the society of young people in exchange for its buffooneries, the martial *te gla*, with its helmet topped by an enormous crest of plumes and armed with a wooden sword, continues to instill fear into the spectators. The majority of these masks, both male and female, are connected with the great tribal cults, dif-

and, above all, to women, since the ceremonial masks are sometimes kept inside. A masked participant, or even two, takes part in all the more important ceremonies.

The wall painting and the mask represent the most important artistic creations of this region. However, the ancient Ngere must have known the smelting of metal, for they have left a large number of copper personal ornaments showing great skill and a finely detailed decorative sense. The outstanding examples are some very pretty bracelets, showing signs of much wear and tear and yet covered with a centuries-old patina. In these forests, inhabited by herds of elephants and numbers of smaller wild beasts, ivory is used for making bracelets and certain ritual accessories such as priestly insignia, and the fangs of panthers are made into necklaces with magical powers. Ivory, however, has never been used for figural sculpture here; in fact, the people of this cultural area are not in the least interested in statuary. On the other hand, the Ngere have demonstrated their real ability, so often underrated, in remarkable examples of their figural art in metal. This production consists of several dozen little statuettes of copper representing a wide range of subjects. Most of these small masterpieces are female figures, in ceremonial costume or completely nude, who make gestures of ritual significance. The museum of Abidjan owns a figurine of a naked pregnant woman with belts and necklaces who holds a large knife in her hand to show that she is the director of a female cult society. There are also examples of contemporary masculine subjects, such as an African rifleman standing at attention. Among these miniatures of exceptional artistic merit there are also replicas of objects used for religious or secular purposes, such as a ceremonial ax, a cult vessel, a sword used for slaughtering animals, and a chair.

The inhuman aspects of the Ngere masks, with their ferocious and evil bestiality, are also found among the Ubi, the Wobe, the Niabua, and some of the Dan, so that it is possible to observe a regional style with a range of local variations. However, among the Niabua there is a barely perceptible transition toward the very personal style of the Bete. The mask of the latter type has the heavy projecting brow and the traditional tubular eyes of the Ngere masks; the face is very long, with features composed almost entirely of geometric elements, to which are added incredible excrescences — curved horns, fangs, and points. Among these strange faces, bristling with the inventions of an imagination both fertile and almost paranoiac, are still discovered works that are free of these trappings. Above smooth oval faces are bulging hydrocephaloid foreheads; this striking anomaly, far from being disturbing, lends to this type of mask an expression of refined, concentrated spirituality. Some authorities attribute this latter type of mask to the Gagu, the most archaic tribe of the Ivory Coast, who live in the Ouémé region close to the Bete (and partly under their influence), but this hypothesis still needs verification. The equally rare carved figurines are noted for the refined modeling of their elongated and carefully polished bodies, as well as for the scrupulous care with which the typical skin decorations (the scarification of the abdomen, the back, and the thighs) are reproduced (PL. 118). Their height, which is greater than that of most of the wooden statuettes found in the great forests of the Ivory Coast, may be as much as 3 ft. These rare works of the Bete constitute some of the most impressive creations of Negro sculptural genius. The art of the Dida and the Godye, who live to the southeast of the forest civilizations, has so far aroused little interest.

The Dan, who have been mentioned previously, are a vigorous ethnic group living in the Man region, whose remarkable artists have justifiably earned the appreciation of experts on African art. The Kono, the Mano, and the Dan probably derive the essentials of their sculptural art from the Yakuba style; even if this assertion must be somewhat qualified, there is doubtless a cultural overlap between the two areas. Consequently, what has been said about the masks of Upper Guinea applies also in general to those of the Dan. The latter present a strange formal dualism, a phenomenon that also appears in other civilizations of the Ivory Coast, in particular among the Baule and the Senufo: on the one hand, there are crudely made works with a polychrome finish that does not conceal the esthetic deficiencies, while on the other, there are thin, sensitive faces, beautifully carved and varnished very soberly in black (PL. 125). The thinness of the skulls, the careful polishing, and the smiling but elegant expressions delighted the first collectors of Negro art at the beginning of the 20th century, and with good reason. The classifiers of these masks divide them into several styles and substyles, but only two very distinct types need be distinguished. The most refined of the Dan masks, in spite of their thick lips and round, wide-open eyes, have noble convex foreheads and pointed chins and generally come from the region of Danane; while the areas of Binhoué and Flanpleu have produced the ugly masks which are intended to inspire fear rather than esthetic pleasure. But the geographical limits between the different centers of production are not clearly defined and reciprocal borrowings are common. The works distinguished by deep incisions in the temples come most often from the northern zone occupied by groups of Dyomande and are described as belonging to the "substyle of the upper Bafing." This region presents many distinctive cultural features, including a society, the Komo, which is practically unknown to the rest of the Yakuba. In its ceremonies it uses heavy masks with long hornbill beaks that recall certain forms of the Toma or Kpelle of the Guinean-Liberian forest. Among the Dan creations, the *sagbwe* mask deserves special mention; it has a lively red face made of cloth on a wooden base and is worn during the dry season by an inspector of the hearths in order to prevent fires in the village. The masker is severe on this point and readily strikes negligent housekeepers, though he generally acts the buffoon, making ridiculous jerky and unexpected movements. Sometimes he entertains the newly circumcised during their initiation retreat.

The Tura have been pushed by the present Yakuba up into the high mountains, where their villages perch on rocky mountain tops as high as 3,000 ft. They possess a mentality and a cultural type clearly different from those of the Dan invaders. Their religious life and ceremonies, unknown until recently (for example, the annual agricultural ceremonies at the opening of the yam harvest), have little in common with the Dan rituals. The faces of the sacred masks are related in conception to the common masks of the Yakuba without sharing their technical accomplishment, but the dress and the equipment of the dancers differ appreciably.

*East Guinean and Cross River arts.* The Guro (Kweni), the Yaure, and the Baule living near the center of the Ivory Coast fall within a cultural framework quite different from that of the forests of the southwest — namely, the grasslands group, among which arts of great value have developed. Although the Guro, according to linguistic criteria, are considered part of the Mande-fu, and the Baule (to whom the Anyi may be added, with some reservations), have Akan blood, the two groups form a regional artistic style that is relatively unified and homogeneous.

The Guro masks of the Zuénoula, Vavoua, and Bouaflé regions are justly ranked among the finest artistic creations of the Ivory Coast. The existence of these masterpieces among a relatively backward people proves again that artistic creation does not depend entirely on the cultural level. Here beauty seems to spring forth directly from unknown depths of the human soul, with a spontaneity that surpasses artifice in its direct, sensuous appeal. This may help to explain why the Baule excel in wood sculpture and use masks, while the Anyi, although they derive from the same recently formed ethnic stock, do not know this art. Taking everything into consideration — the closeness of the Baule group to the archaic tribes, former occupants of lands conquered by the invading Akan — it is conceivable that the Baule only appropriated the techniques of the conquered and adapted them to their own needs. This is true only of two main categories of works in wood: the masks and the pulleys of the looms; the Guro have not developed sculpture. Also, in the case of the Guro, there is a perplexing coexistence of superb anthropomorphic masks and crudely executed zoomorphic masks of the *die* type. The former usually represent delicate human faces, feminine, or masculine with effeminate features. They often acquire the characteristic attributes, large ears, tusks, trunks, and horns, of certain animals such as the elephant or the buffalo. These masks occur as symbols of totemic inspiration in commemorative ceremonies in honor of dead ancestors, or in the course of sacrifices made to minor guardian deities. The other type of mask belongs to the ritual apparatus of the men's societies, which are called Die, Do, etc. Looking at these masks one almost feels that the white and tender blocks of wood from which they emerged, and which the violent painting cannot conceal, have been roughly and too hastily shaped with brutal ax blows. In spite of this crudity the *die* have vivacity and a fine naturalism. In confining himself to sketching the characteristic traits of an animal, the Guro sculptor obtains a very evocative result, perhaps just because of his simplified technique (PL. 120). Among the Guro masks a special place is held by the *zamblé*, a zoomorphic mask which is probably derived from an anthromorphic one. The Guro assert that it is a recent innovation conceived by a talented sculptor called Zamblé, only a few years ago. This recent origin does not detract from the exceptional appeal of the mask, which is easily recognizable because it is clearly marked by the strong personality of its creator. Indeed, almost all of the 100 known works, male and female, seem to have come from the same mold: a long multicolored face, crowned with the twisted horns of a bongo, an extended jaw armed with rows of white fangs, and a pair of slit eyes outlined in red. Unlike the *die*, the *zamblé* always appears in an individual dance that is very fast and full of leaping, and he is followed by a partner who represents the female counterpart. The little community of the Kuya, who live in the locality of Vavoua and are practically assimilated with the Guro, possesses several particularly gifted artists whose works, either unknown or wrongly considered to be of Guro origin, display the highest artistic quality. The few Kuya sculptors have specialized in

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

making anthropomorphic masks that are very carefully executed and heavily ornamented, though lacking in expression. Like the Guro and the Yaure, the Kuya (with few exceptions) rarely carve statues, although not because of technical incapacity, as they produce very fine ivory figurines.

The pulleys of the looms, marvelously carved, are for the most part inspired by large animal and human masks, but they are also original creations. Their diversity, their fine shape, and their patina have made these small objects highly sought after by collectors. The Yaure and Baule weavers use pulleys similar to those of the Guro, and the variety of their decorative motifs is perhaps even greater.

In the low mountains to the northeast of Bouaflé, the Yaure have developed a civilization of a type intermediate between those of the forest and of the grasslands, corresponding to their physical environment. Apart from some beautiful pottery, the artistic interest of this very small tribe lies essentially in its masks, which do not equal the dramatic effect of those of the great forest but are impressive in the delicacy of their execution and the perfect balance of their features. The long thin faces with a withdrawn look that makes them seem lifeless or absorbed in mystic contemplation, and with the thin lips, the narrow projecting chin reminiscent of the false beard of the Pharaohs, and the zigzag line like a halo, are undoubtedly among the finest artistic creations of the Ivory Coast. This assessment, naturally, does not apply to the recent everyday masks produced for visiting tourists. The ornamental attributes of the Yaure masks reflect a very elaborate symbolism and a complex mythology which are becoming incomprehensible to the people and are expressed in conventional symbols recalling the old lunar and solar cults that have disappeared into oblivion. The use of masks among the Yaure is similar to that among the Guro.

The work of the Baule sculptors, probably the best known among collectors of west African art, can be divided into several categories. Among secular objects are numerous household utensils (spoons, ladles, dishes) that are made with taste and precision, as well as various seats and stools, chairs with backs, the carved handles of tools, and the like. These works, however, rarely appear in art collections. Some objects fall on the borderline between the secular and the religious or merely ceremonial: chief's insignia; ceremonial canes which symbolize tribal beliefs and adages; flywhisks reserved for those of important social rank. In spite of an obvious functional corruption, most musical instruments retain an indication of their primitive ritual role, particularly the magnificent drums, ornamented with polychrome reliefs, and the remarkable *dawle* or *laule*, the gems of Baule sculpture. These are small carved sticks used in the course of certain feasts for striking a flat bell of iron, which produces a clear metallic sound. Like the numerous loom pulleys, the heads of these sticks carry ornamental motifs drawn from the rich mythology and popular traditions of the Baule. Especially worth mentioning are the carved doors, works of the past, with decorative designs in relief inspired by both mythology and everyday life. The images of ritual masks and symbolic animals (mainly those associated with water mythology, fish, crocodile, varan, and python) are mixed in a disconcerting proximity with historical or living people (for example, a military officer on horseback). Works intended for cult purposes fall into the two usual categories, masks and statues. The latter are more numerous among the Baule, contrary to the situation in the other groups of this cultural area.

In the grasslands cultures the making of ceremonial objects in wood is not the prerogative of the smith, as is often the case elsewhere, but of a sculptor in wood who has specialized in this type of work. Any gifted individual may enter this craft. Baule sculpture presents the sort of formal parallelism that was discussed earlier. Two forms exist, two diametrically opposed concepts of ritual masks: the large masks, made with little attention to detail, and the little anthropomorphic masks that are very carefully executed and are closer to Western taste. Although complementary and sometimes interchangeable, the functions of these two categories of masks must not be confused. The large masks are used almost exclusively by the men's societies of the villages, which are known by the name of the guardian deities under whose sign they are instituted: Do, Botiva, Die, Goli, etc. The small masks have a more universal use in the great feasts of the agrarian cycle, in funeral ceremonies, and in other events which embrace the whole community, including the individuals who do not belong to any of the cult organizations mentioned. The sacrifices which necessarily accompany such ritual ceremonies are intended for one of the two principal divinities, Nyamye of the sky and Assye of the earth. A counterpart of the Earth Mother, the latter occupies the central place in the thriving telluric cults. Altars called *assye bonu* were once placed in all the Baule villages, at the crossroads. These were tiny huts sheltering effigies modeled in painted clay, of symbolic animals associated in myths with the forces of the earth and the waters, especially the huge python (here without doubt a phallic symbol), the chimpanzee (with erect phallus, the promise of approaching fecundation), the tortoise (symbol of the vulva), and the crocodile. The two supreme deities (who, incidentally, are unrelated by any theological attributes) are represented only indirectly, in the aspect of their mythological intermediary god or associated animal symbol, or even in a conventionalized ideogram which, in the altars of Assye, may take the form of a specially shaped piece of pottery with a lid. Nyamye (not to be confused with the ancient creator of the universe, Adudwa or Alulua, who is so remote as to be practically inaccessible to man) manifests himself to his devotees preferably in the form of a ram or a buffalo, animals famous for their strength and virility.

The large Baule masks have a clearly zoomorphic character. An analysis discloses sculptural features inspired by the animal world that the artist observes around him every day: the great hoofed animals of the bush, the hyena, the hydrosaurians, the reptiles, and various birds. Added to these are the forceful creations of the mystical imagination, so that the various ornamental motifs, often difficult to classify zoologically, which are superimposed on the massive jaw of some wild animal, owe their presence to mythology or, if one prefers, to totemism. Like other tribes of the Ivory Coast, notably the Senufo around Korhogo, the Baule sculptors sometimes make heavy animal masks formed of two opposed heads, which are worn as hood-masks by the dancers during the ritual, as they are among the Mende of Sierra Leone. The horned masks called *goli gulin*, *botiva*, *die yassua*, *do*, and the like, all seem to be based on the same model, the buffalo or the bull, with each cult adapting them to its particular needs and its own cosmology. The smaller masks, which are more precisely executed and have more varied decoration, are based on the human face and are often described as commemorative works. Although this is only partly accurate, a good many of these *mboro* (which frequently have very different individual names, a generic term often being unknown) are really portrait masks possessing specific identities. Given these facts, the place of these ritual instruments in the ancestor cult seems only logical and perfectly justified from the theological point of view. Among these essentially human masks, always rich in ornament, the buffalo (*ewe*) and the ram (*mbalwone*) are few in number but actually have a high place in the hierarchy as allegorical representations of celestial deities. Between the two types of wooden sculpture, the mask and the statue, there exists a parallelism of concept revealed by the similarities between the large masks of the *die* and *do* type and the statues of the minor divinities, on the one hand, and between the *mboro* and the statuettes called *waka sona*, which are completely anthropomorphic, on the other.

In Baule statuary the minor gods appear most often in the form of an animal carrying in its paws a cup ready to receive the offering, but they may have an indeterminate, composite character (IV, PL. 206). These objects, usually referred to rather unsatisfactorily as *gbekre*, are relatively rare both in their natural religious context and in collections. Their importance lies less in their esthetic value than in their ethnological significance. When they were first encountered, little was known of their true ritual purpose or of their position in the hierarchies of the local pantheons. Recent research makes possible more accurate evaluation of these figurines; they occupy a central place in the lesser cults, which function independently of the rituals of Assye but always have some connection with the forces of

fecundity of the earth. If the Baule civilization is recognized as one of the "yam belt" cultures, with strong ritual associations in the cultivation of yams, it becomes clear that the *gbekre* has a ritual function of great importance, although it is being displaced by a new intolerant god known as Tete Kpan, or Ahiere Kpli. An extensive study of the known specimens yields the following types of *gbekre*: (1) In first place, judged by the occult power for which it serves as vehicle, is undoubtedly the *ndiadan*, or great lord, a statue that is impressive not only for its size (it can be 3 ft. or more high), but above all for the bestial expression on its apelike prognathous face. As a weekly public offering the *ndiadan* receives a dish of *mvufu* (gruel made from yams and palm oil) and a little *mezan* wine, and from time to time a sacrificed animal to protect harvests and births. The figurine must be carved from wood of the *iroko*, the most appropriate kind for this holy use, since it is supposed to contain an especially strong and formidable occult power. Certain examples of the *ndiadan* in collections accessible for study are dressed in extraordinary clothes and accessories (raffia skirts, belts, and ankle bracelets) and possess attributes of magic significance, such as pendants of marcasite or neolithic axes that are believed to be of supernatural origin. (2) Most typical and most popular god in this category is certainly a cynocephalous deity, the *mbotumbo*, the name of the cynocephalous monkey in the savanna of the Ivory Coast. More grotesque than beautiful, sculpture of this kind has little esthetic value; its creator has clearly followed only the ritual requirements by which this strange god appears to the faithful in all its sacred ugliness. (3) Another minor guardian spirit, the *gbokro kofi*, is a personification of the hyena, believed to be in mystical communication with the underworld of the dead by simple theosophical reasoning that is easily understood. The *gbokro kofi* is thought by some authorities to play a ritual role as a kind of psychopomp in the Baule funerary rites, and it is said that together with other divinities of secondary importance, the *kakandie* and the *gbekre*, it conducts the souls of the dead into the beyond. This particular role has not been proved in the case of the *gbokro kofi*, however, which seems to prefer the affairs of the living. Like the *mbotumbo*, the *gbokro kofi* usually has a height of about 2 ft. Invariably, as if it delighted him, the artist exaggerates the teeth, which so weigh down the head and unbalance the whole anatomy of the *gbokro kofi* that they become the principal formal characteristic. (4) The *aboya*, sometimes described as the "father" of the two preceding gods, and also called *mbla mandwa kwassi* in certain regions, takes second place in hieratic importance among the various *gbekre*. Unlike all the others, the *aboya* has a more or less human appearance. As its second name indicates, the figure is characterized by a flywhisk made from an ox tail, which it holds in its right hand as an attribute of its dignity. Although the cult of the *aboya* has practically disappeared from contemporary religious practices, it seems that its main purpose was to free the village from all kinds of evil influences. It was particularly occupied with witch hunts and presided at the divinatory ceremonies to identify the persons responsible for all deaths under strange circumstances; sometimes it even executed the sentence. In its beneficent aspects the *aboya* willingly helped sterile households and in general occupied itself actively with the problems of births and with the material prosperity of its devotees. Although accepting chickens, sheep, and occasionally oxen, this god preferred the sacrifice of dogs.

The execution of these idols is fairly crude and inexpressive in comparison with the famous *waka sona*, representations of ancestors and living people, which for Western taste are the most outstanding creations of the Baule genius. In spite of the presence of thousands of these figures in collections, information on them is incomplete. No doubt this is due to the fact that the first collectors of Negro art, struck by their extraordinary beauty, which harmonizes with Western esthetic standards, neglected to ask their purpose (PL. 122). The *waka sona*, statuettes sometimes called votive and sometimes commemorative, fill a very imprecise place in the ritual. They all have a strongly personal character and, without exception, serve in individual cults which may easily escape the observer. The models may be chosen from either the visible or the invisible world. The figures represent persons of both sexes and all ages, either standing or seated, all set in conventional attitudes which somewhat detract from their individuality but give them in return that kind of noble inertia which is so characteristic of African statuary, and which confirms their fundamentally hieratic origin. Their entrance into the domain of the secular dates back only a few decades, in the author's opinion, and manifests itself in certain secondary but significant details borrowed from Western civilization: cork helmets, European costume, imported shoes, and hunting rifles. The artist always pays special attention to the faithful rendering of decorative scarifications, which were formerly characteristic of the various subgroups of the Baule. The *waka sona* are usually fairly small. The beautiful finish of vegetable colors, both somber and elegant, relegates polychromy to the background (PL. 123).

The divinatory boxes (*gbekre bo*), usually ornamented with figural designs, are still used daily in the Baule villages. They are employed in a kind of divination which requires the use of live mice in the positioning of knuckle bones placed on a bed of rice. After letting a hungry mouse loose on the rice, the *gbekre fwe* reads the oracle from the marks which result. The carved handles of the flywhisks and the chiefs' insignia, with their motifs drawn from tradition, are usually finely executed and then covered with thin gold leaf. This important class of ceremonial objects is found among all the Akan of the Ivory Coast, particularly among the Anyi. The Attie, the Abe, and the other neighboring tribes imitate this custom, although usually obtaining these objects from Baule sculptors. Among the Anyi, the use of wood in making ceremonial objects is much less widespread than among the Baule and is confined to two typical forms: carved seats, which are of great importance in religious ceremony; and statuettes, easily recognizable by their long, ringed necks, which are supposed to have beneficial properties and are referred to by the tribesmen as "fertility dolls." If there are a large number of carved insignia and gilded objects in the houses of the chiefs, it means that the mask is unknown in this area, as is the case among the Abe, the Attie, the Brong, and other tribes.

The local cotton is used in weaving, with excellent results, and this industry still flourishes in spite of the competition of imported cloth. The Baule blankets and loincloths have a beautiful blue-black color, obtained by dyeing the thread with indigo from bushes grown in the villages. The Baule dyers use a technique of successive soakings, during which an ingenious system of knots makes the desired pattern on the cloth.

Each region has its own centers of production of pottery for secular purposes, but the only products that are interesting from the artistic point of view are the funerary clay heads made by the Anyi of the Sanwi group, inheritors of the kingdom of Krinjabo.

Among all the tribes of southeast Ivory Coast the production of metals is insignificant today. The extraordinary *dia yabwe*, weights for measuring gold dust, are certainly of Ashanti origin; these people must have brought them from their old homeland in the Kumasi region of Ghana, in the course of successive migratory movements begun in the middle of the 18th century. The problems of the origin of these weights and of their system of graduation are too complex for discussion here. The weights made in geometrical form (cast in copper by the lost-wax method) are of slight esthetic interest, but from these have evolved figural pieces particularly admired by collectors, representing the most diverse subjects and scenes. Among these small masterpieces there are both original designs and pieces molded from natural objects. The first type is more interesting, especially for an expert, for these objects all speak an apocryphal language, full of double meanings, mythological allusions, and illustrations of the old Akan philosophy, particularly of the often ironic proverbs and moral sayings. The subjects represented are innumerable (PL. 128): domestic animals and such wild ones as elephants, buffalo, large antelopes, panthers, birds of every kind, crocodiles, fish, coiled snakes; miniatures of ritual objects and household articles; castings of lizards, crabs, insects, small fruits; tiny human masks; people, either separately or in groups, such as a hunter, old chiefs sitting on stools, checker players, a drummer, groups of dancers, a woman carrying a pot of water, a mother and child.

The Baule and the Anyi possess jewelry of some antiquity, as well as the work of contemporary craftsmen. The finest pieces are heavy gold masks and breastplates in the form of the customary tribal symbols. While serving as adornment, these also possess apotropaic power and so may be considered beneficial amulets. Similar personal ornaments of gold also exist among the lagoon peoples, such as the Ajukru and the Ebrie, and among the inhabitants of the coastal strip, such as the Alagya (Alladians).

The paleo-Negritic culture of the northern tribes of Ghana (Dagari, Tallensi, Vagala, and Dagomba) does not require the use of masks or statues in its rituals but makes up for the lack of these accessories in luxurious ceremonial ornaments. This situation, which recalls that of the Basari and the Konyagi in the Republic of Guinea, does not vary much among the neighboring tribes of North Togoland and Dahomey (Konkomba, Kabre, Youwa, Somba, and others). These small tribes, though fascinating for the ethnologist and anthropologist, create only small quantities of uninspired art.

In southern Ghana, where the highly developed economy is founded on a national political system, material conditions do not favor the flourishing of the arts. Because their culture is rapidly changing, the peoples of the coast are preoccupied with efforts at adaptation and seldom create art in the traditional pattern. This is true of the Fanti, Awuna, and other tribes. Among the activities of interest from the artistic point of view, only jewelry making, which is famous even in the neighboring territories, is worth mentioning. Thus, the widely varied cultural forms which have evolved in the three administrative sectors of present-day Ghana cannot compare with those of the Ivory Coast in artistic creation. The only exception, and a very impressive one, is the Ashanti culture, in which weaving and dyeing of cloth, pottery (see below), metalwork, and sculpture in wood reach an outstandingly high standard. The flattened and disk-shaped heads of the Ashanti dolls (*akua'ba*), which undoubtedly are of symbolic derivation, resemble the ancient clay heads of Fomena (see above). Carved of wood and painted black, these dolls have their arms crossed, are dressed in a simple *cache-sexe* of cloth, and wear necklaces, earrings, and other ornaments (VI, PL. 1). Sterile women and those who want more children carry *akua'ba* as talismans to encourage fertility. The traditional textile industry is similar to that of the Baule of the Ivory Coast; worth noting is a special technique of dyeing called *adinkira*, which makes use of wooden stamps to print the desired design on the fabric. Some authorities consider the casting of metal by the lost-wax method a borrowing from the expanding Ashanti state two or three centuries ago. Certainly the Ashanti metalworkers must be acknowledged as the creators of the gold weights (PL. 128), the magnificent *kuduo* (PL. 127), the ritual vessels or *ntoro* (often of silver), as well as numerous objects in bronze or copper that are figural works of considerable documentary interest (PLS. 124, 127). The proverb weights are the most important works in this category, both for their form and for their content. One example, a weight representing two entwined crocodiles (an allusion to tribal unity and solidarity expressed by the proverb, "Many jaws, but a single belly") is very well-known. The Ashanti ritual, like that of the Anyi, has no place for ceremonial masks, although R. A. Freeman in 1898 noted the existence of ceremonies in honor of a tribal god, Abosom, in the course of which an antelope mask appeared. Masks are not known in the rest of the territory, however, except perhaps for local innovations not recorded in the pertinent literature. Masks reappear much farther east among certain Dahomey tribes.

Togoland, including the zone that is now part of Ghana, offers a picture similar to that of the former Gold Coast; in the north are archaic civilizations, materially backward without any noticeable industries [the Tem, Kabre, Namba (Lamba), and Konkomba], while in the south are relatively advanced peoples who are undergoing rapid cultural change but who have shown little artistic ability. Only on the borders of Dahomey, among the Nago, the Fon, and even farther away among the Holli (Awori) on the border of Nigeria is there a rich sculpture in wood for ceremonial uses. Statues and masks, both under the influence of Yoruba prototypes, are produced in a huge area which extends over three countries: a part of southern and central Togo, southern Dahomey, and the western provinces of Nigeria. The Nago and the Holli, who form the vanguard of an enormous bloc of Yoruba, produce art not very different from that encountered in Nigeria. This is also true of many other small tribes in the vicinity of the Yoruba, such as the Mahi and the Gun, the latter living near Porto-Novo.

Historical enemies of the Yoruba, the Fon of Dahomey in the past set up well-organized states, protected by strong armies. Around the splendid court of the kings of Abomey, religious art and secular crafts flourished side by side. Craftsmanship still prospers, encouraged by the popular philosophy and by an exuberant and spirited oral tradition, but artistic values decline in proportion to the progressive commercialization. Untrammeled by dogmatic mystical thought, individual initiative frequently finds expression in local arts which were formerly closely bound to prototypes; there are, for example, figurines about 8 in. high, modeled in clay and outrageously polychromed, the work of an obscure artist in Porto-Novo. A complete collection of these can be found in the Geneva Ethnographic Museum. These squat, inelegant figures with protruding eyes are far from the conventional conception of beauty, yet they are touching in their childlike sincerity.

The pictures on the royal buildings of Agadja and Ghezo at Abomey show, in addition to a few allegories, historical and sacred scenes: emblems, human sacrifices, animals symbolizing particular kings, battles, illustrated proverbs, and so on. Because of their unrivaled documentary interest, the polychromed bas-reliefs of the Fon have been thoroughly studied by ethnologists, but their artistic value has been exaggerated (PL. 116).

Although a humble craft, the engraving or pyroengraving of gourds has been perfected to produce extremely pleasing results with beautifully balanced designs. The figural sculpture in wood (usually painted), which reveals a lack of technical skill not offset by any primitive charm, is less satisfying to Western taste (PL. 129). However, the museums in Paris, Dakar, and Abomey display some pieces of monumental sculpture that are truly impressive. The most noted examples, reserved for the kings at Abomey, are the great zoomorphic statues of the kings Ghezo and Glele, the portrait of Behanzin (Gbehanzin) armed with a sword, and the effigy to the supreme female god Mawu (Mahu), the consort of the creator Lisa. There are also some statues of symbolic animals which represent kingly attributes (lions, elephants, buffalo, wading birds, sharks; PL. 129). The guardian statuettes, such as the individual *legba*, are often made without any care, since they are exclusively for religious purposes. Like the Yoruba, the Fon use cult objects of a uniform exterior appearance, commemorative and allegorical masks (PL. 129), and votive statuettes, of which a surprising number are intended for the cult of twins.

The *ase* are metal portable altars used in the cult of kings and ancestors. They are unique works found nowhere else in the art of the Gulf of Guinea. The *ase* are made by the metalworker-jewelers of the Hutuji (Houtousji) quarter in Abomey and are composed of a head, recalling a kind of inverted cone, decorated in an extraordinary way peculiar to the ritual requirements, the whole supported by a long shaft that permits it to be planted in the earth. Depending on their form and their symbolic attributes, the *ase* may be consecrated to dead kings, to the god Fa, the master of oracles, to another spirit of the Fon pantheon who is addressed in the name of the king, or finally to personal ancestors. There are other *ase* known as *hotagati*, differently conceived, which are attached to the roofs of royal sanctuaries instead of being planted in offering places, where the *ase* receive libations of alcohol and the blood of victims sacrificed in honor of the god, king, or ancestor.

The magnificent high carved thrones are believed to be the repositories of royal power and take a central place in a ritual designed to assure the spiritual and temporal continuity of the chieftancy and of the community; most of these sacred relics are preserved in museums such as that in Abomey.

From the historical point of view, the system of Fon gods, or *vodun*, has a complex and syncretic character; the royal and pop-

ular cults are part of a disciplined religious hierarchy under the guidance of a strictly organized clergy. The influence of the royal family penetrates all spiritual life, while some religious ceremonies take on the role of national demonstrations. From the artistic point of view the two great creators are of little interest; the statue of the "Mother of Humanity," Mahu, mentioned above, seems to be an exception. On the other hand, the gods that are the objects of popular worship and control natural forces are very frequently represented. Such are the *vodun* connected with dangerous diseases and with the elements, sky, earth, water, and thunder, or those who are the patrons of professional associations. Fa, the god of the geomancers known as *gbokono*, is interesting as the promoter of a ritual industry that makes divinatory tablets of wood, decorated with symbolic designs.

The extraordinary intensity of the religious belief of this people penetrates all their artistic activities, including the crafts. However, the craftsmen today work almost entirely for European collectors, particularly in the production of the brass statuettes made in large numbers by the associations of metalworkers in the region of Zagnanado. Inspired by traditional works or by the creative imagination of the craftsman, groups or single figures represent various animals or tiny people (sacrifices made to Heviosso, the executing of a slave, the cortege of a king). The famous hangings with appliquéd designs also have become degraded in recent years into commercial articles; they reflect with great fidelity the common subjects of the decorated walls of the palaces and temples, thus indicating an allegorical significance relating to a proverb or a philosophical expression or illustrating the famous historical events of the country.

The Yoruba, who live in the heart of Nigeria, are divided into many subgroups distinguished by important cultural differentiations. Thus some localities, such as Oyo, Ibadan, Abeokuta, Ilorin, Ife, Owo, Benin City, and Iseyu (see above) have become real centers of regional civilizations without, however, ceasing to be part of a larger, relatively uniform grouping. Basically agriculturalists, the Yoruba have a dynamic temperament and an innate migratory tendency, but their present civilization is urban. Living in towns that by African standards are large and overpopulated, the Yoruba form a hardworking, very religious people, endowed with an unequaled artistic feeling. The interest of the local artist seems to be directed not toward ephemeral values (a surprising fact in consideration of the very practical, even commercial, spirit that has also developed among the Yoruba) but toward a belief in life after death. It matters little whether this conviction of the absolute, of the eternal, finds concrete expression through a cult of gods, kings, or ancestors, or whether it shows itself in a rather different way by a system of defenses against malevolent influences. The existence of countless divinatory instruments confirms this, for every human being, finding that he must depend on invisible powers, has reason to establish firm bonds with them and to take no decisive action without consulting them in advance.

A more or less direct parallel exists between the Fon *vodun* and the Yoruba *orisha*. In place of the two divine creators, Lisa the male partner and Mahu the female, are Olorun at the summit of the hierarchy and two gods associated in the work of creation, Obatala and Odudua (PL. 129); Fa becomes Ifa and plays the same role in the field of divination. The names and functions of the many Yoruba gods vary according to place and circumstance. The highly elaborated and specialized organizations of priests reflect this theological complexity. Assisting the priests in the struggle against natural disasters and the vengeance of evil spirits, as well as in the complementary function of honoring the memory of ancestors, are the cult associations such as the Ogboni, Gelede, and Egun. These exert a considerable influence on the Yoruba artist who creates the necessary ritual instruments. The Ogboni is the originator of two important artistic forms: the richly carved ceremonial drums called *agba* and the *edan* figurines, the sacred insignia of the society. The latter consist of two rods of iron on which are welded human figures, male and female, whose heads are joined by a chain. The *edan* is a secret object kept in the fastness of the sanctuary.

The *efe*, who comes directly from the underworld, is a strange masked being who drives away the sorcerers responsible for calamities and encourages the fertility of the fields and of the women by parading at night through the village together with three drummers chanting the appropriate songs. A large number of masks, sometimes as many as fifty (in couples), are used in the ritual reunions (called Gelede) before the assembled members of the society. The masks are all of the same fundamental type and are distinguished only by ornamental details which indicate their identity and their importance in the hierarchy. Their faces are painted in vivid imported colors and carry the three Yoruba scars on each cheek; sometimes they have penetrating almond-shaped eyes with white corneas. Made from light wood which decays easily and is vulnerable to destruction by termites, the *gelede* masks in museums are usually recent examples which, because of their exaggerated stylization and their often garish colors, rarely have much artistic appeal to Western taste (PL. 126). In contrast to the simplified naturalism of these masks, those of the northeastern Yoruba are notable for their excellent qualities of abstraction and composition, although they were late to appear in books on African art. In this particular group the heavy hood-masks reappear; of complicated construction and complex symbolism, they have unfamiliar generic names: *epa* (mask with a heavy superstructure; IX, PL. 355), *elefon* (a lighter type), *egun* (PL. 132), *koko* (literally, pot), *afofora*. However, as in other parts of the Gulf of Benin, each mask has another, personal name such as Olokosse or Oloko ("Master of the Bush"), Adja, Oditi, Opon, Ugura, or Olioro. It would be a mistake to confuse these works of art with the instruments intended only to terrify the profane or the neophytes, as certain authorities have suggested. Though their first use is to facilitate contact with the invisible, they can also be transformed into public entertainers. This happens frequently in the course of perfectly serious rituals, since every socioreligious initiation contains comic elements necessary for the restablishment of the temporarily disturbed psychological equilibrium.

Every *orisha*, every cult society, and certain famous temples possess special liturgical inventories with exclusive insignia: among the Fon of Dahomey, the *vodun* Lisa takes the chameleon as a symbolic animal, and the ax of Heviosso is decorated with a ram spitting fire. Similarly the Yoruba gods have their attributes: Shango the Thunder, who corresponds to Heviosso, wields a double ax (*oche*), which is an essential part of all the rites and all the statues that are consecrated to him. The great god Obatala is not directly represented but is symbolized by elephants' tusks. The attributes of Ogun are an enormous cutlass and a double bell. In considering the wooden ritual statues, one observes that the effigies of some cults are distinguished entirely by the decorative detail; for example, the temples of a river deity (Oshun, goddess of the river of the same name) contain statuettes executed exactly like the others but curiously flecked with white.

Among the Yoruba, unlike the semi-Bantu peoples of the delta of the Niger, the cult of twins is widespread. If an older twin dies, the parents are obliged to get a sculptor to make a figurine named "Ibeji," resembling the dead as closely as possible, of the same sex, and about 8 in. high. The survivor or the mother, if both twins die, then treats the statuette (or statuettes) like a living being, feeding and dressing it. In spite of their smallness, such sculptures are often fine works of art (PL. 130). On first acquaintance Yoruba sculpture produces a misleading impression of uniformity; a detailed analysis, however, not only distinguishes a great variety of local styles, some of which (like the excellent works of the Owo region) had remained unknown to experts for a long time, but also reveals the sporadic emergence of artists of strong individuality who constantly introduce new forms. In addition to the very common ceremonies of the Gelede there is a particularly picturesque biannual one in the Yoruba country, the Epa, which is a veritable review of the giant masks of the type mentioned and is an excellent occasion to see how the conventional form of the masks in a given category can vary depending on the personality of the creative artist. The *epa* masks always have two enormous faces (opposed like those of Janus on antique busts) on their lower part (the hood). With a height of as much as 4 ft. and a weight of 110 pounds, the *epa* are almost monumental works which permit the artist to express his genius freely, always re-

membering, however, the dancers who, in order to give life to this cumbersome apparatus, have to leap over a hillock a yard high without dislodging or injuring their masks. The Yoruba also excel in low-relief sculpture, of which three typical kinds can be mentioned: the plates made for the geomancers of Ifa, the doors (PL. 131; FIG. 245), and the carved pillars, which are

Carved door, Yoruba tribe, Nigeria.

some of the most striking esthetic creations of this civilization. (See also IX, PL. 522.)

Farther toward the southeast the Negro civilizations come to an end approximately at the delta of the Niger, where almost without transition the first outposts of the Bantu world are met in such tribes as the Ibo, the Ijaw, the Ibibio, the Efik, and the Ekoi of the Cross River, who belong to the semi-Bantu linguistic group. They have developed their own unique art forms, which reflect a more individualistic mentality. Usually freed from convention and not adhering to prototypes, these arts have a different psychological approach and create exceptionally dramatic effects. In this complex, the Ibo art seems the most expressive and the most powerful, in spite of its frequent borrowings from neighboring tribes with a more autonomous esthetic, such as the Ibibio, Ijaw, Igala, and others. The vast territory of the Ibo encompasses a great variety of carved wooden masks, the northern styles showing a preference for realistic forms, while in the south there is a distinctly abstract trend. Sometimes the mask covering the face of the sacred dancer is replaced by a carved figurine enhanced with vivid colors, which is carried on the head of the dancer during the ritual ceremony. Among the Ibo are found large human figures for religious purposes, used especially in the various ancestor cults; extremely beautiful slit drums with ornamental motifs; ceremonial benches; decorated cups and plates; and doors ornamented with traditional or modern designs. The Ibibio have created a particularly impressive mask which is used by the Ekpo cult society (PL. 132). It has a heavy but mobile lower jaw which produces interesting aural and visual effects during the rapid movements of the dance. The oldest wooden objects of the Ibibio date back 200–250 years, according to the experts; they are figurines of ancestors, made in a unique style created by a subgroup of the Ibibio, the Oron. The tribes living along the Cross River have developed certain surprising works as part of their ritual accessories. Among these are the carved heads covered with human skin (PL. 132) made by the Ekoi. These heads are striking because of their precise anatomical detail and very naturalistic coloring. They have one, two, or sometimes even three faces carried on a powerful neck and crowned by an elaborate coiffure with spiraled tresses.

Bohumil HOLAS

*Contemporary pottery of Ghana, Nigeria, and the Cross River.* Among the Ashanti of Ghana, where whole villages specialize in pottery, smoke-blackened wares are popular for both domestic and ritual use. Special kinds of pots are made for drinking, cooking, palm wine, melting shea butter, and so on. The shallow bowls for grating peppers have interiors grooved in concentric rings. Water jugs are elegantly shaped, with wide mouths and flattened globular bodies. Incised decoration is austere and is typically restricted to a band of arched lines, sometimes bordered with punched dots. The more ornate kinds of jars are made by men, rather than women, and have lids, handles, and designs representing frogs, snakes (PL. 127), and various artifacts, modeled in appliqué relief. A striking example of a ritual jug, used for pouring wine on the famous "Golden Stool," is decorated with circular panels enclosing scroll designs and a band of palmettes in low relief; the whole treatment suggests the influence of repoussé metalwork. Some of the most artistic work is to be seen in the small tobacco-pipe bowls modeled in various animal forms and made by men. In northern Ghana bands of rouletted ornament are sometimes combined with engraved wavy lines. In the Ho district the Ewe make crude clay heads with flat faces, on which the features are applied with small pellets.

The Yoruba of Ilorin color their vases with red and black slips. Other Yoruba creations are water coolers with two spouts and a looped handle, black incised bowls, tall lamps, and big tubs for dyes, decorated with rouletted ornament.

The peoples of southeastern Nigeria and the southern Cameroons are exceptional in Africa for the beauty and originality of their ceramic art, in respect to both form and decoration. The more elaborate forms are used in ancestral and other religious cults. The Ibo of Onitsha province make large pedestal and tripod vases with ringed necks and small handles; wavy ridges in red, black, and orange tints encircle the body. Their ritual jars often have a number of small mouths, which may be connected by loop handles; others are adorned with human or animal figures in high relief. A unique type of ritual bowl from the Kwale Ibo has its vertical walls topped with groups of squatting figures, well modeled in the round but with stylized features and attenuated legs (IV, PL. 206). Twin cups or bowls, joined at the rims and supported on one or two pedes-

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

tals, are made by the Ibo, Ekoi, and other tribes. Although they do not make true terra cottas, the Ibo model and paint realistic figures of unbaked clay for their *mbari* houses for use in fertility cults. Some of these figures portray deities and spirits, but most are secular and are arranged in groups which vividly depict a wide range of occupations and scenes of everyday life. On the conclusion of the ceremonies they are abandoned.

Like the Yoruba and other tribes, the Ogoni of Calabar use perforated bowls for smoking and drying fish or meat over the fire. These potters incise their wares with owners' "trademarks," some of which resemble Roman letters. The Ekoi and Ijo make strikingly graceful vases both for ritual and for domestic use; they are characterized by slender tubular spouts combined with loop handles, and bodies decorated with sinuous meanders and convolutions, incised or painted, in a great variety of irregular patterns.

**GUPTA, SCHOOL OF.** The Gupta period, which takes its name from one of the greatest dynasties of India, is rightly considered the "classic period" of Indian art, because of the obvious balance manifest in the creation of forms within the religious framework, the organized symbology, and the genuinely esthetic approach. Rich in remarkably varied artistic phenomena, from its first phases through its period of decadence,

the Gupta period represents the peak of creative capacity in Indian figural art, standing equally as the inheritor of the art which preceded it and a permanent influence on that which followed. At the same time it must be considered individually for the distinctive body of art it produced, and not merely as an essential period in the complex evolution of Indian art.

SUMMARY. General character (col. 249). Historical background (col. 249). Artistic background (col. 250). Gandhara and later art of western India (col. 251). The Indian transition style (col. 252). Early Gupta art (col. 253). Classic Gupta art (under the Gupta emperors and the later Vākāṭakas) (col. 253): *Secular architecture; Hindu temples; Buddhist sanctuaries; Ideals of figural art; Sculpture; Painting.* The decline of Gupta art (col. 260): *Late architecture; Late sculpture; Late painting; Minor arts.* The end of Gupta art (col. 262).

GENERAL CHARACTER. The Gupta age represents the classic phase of Indian civilization in so far as it aspired to create a perfect, unsurpassable style of life and as its creations were imitated, as authoritative models, throughout the Hindu Middle Ages and to some degree up to the present day. It had been made ready by several centuries of stimulating contact with Near Eastern and Hellenistic civilization from the days of Alexander the Great (Indian invasion, 326 B.C.), culminating in the Kushan empire (2d–3d cent.). It was inspired by the expulsion of the foreign conquerors and the consolidation of a mighty national state, first under the Vākāṭakas, then under the Gupta emperors in the course of the 4th and early 5th centuries. Gupta civilization assumed its characteristic shape in the 5th century by borrowing extensively from the late Hellenistic-Parthian and Hellenistic-Roman world and transforming these influences into a national Indian spirit. This was an intensive new development, and it created something very original and different, indeed antagonistic to the Occidental inspirations. Under the impact of renewed barbarian invasions from Central Asia the Guptas were in the 6th–8th century superseded by a number of military dynasties. The cities and their rich middle class were ruined. Their hitherto secular civilization became part of a mythical past and was transformed into a sacred heritage to be piously handed down from generation to generation. When in the 8th century an exclusive feudal-clerical society developed, even the understanding of this tradition was lost, and instead it became the model of a medieval culture in the sense in which Christian-Roman and Byzantine civilizations where the models inspiring the Romanesque Middle Ages.

HISTORICAL BACKGROUND. When Alexander's invasion brought India into contact with the Western world, India was a rural country with a few towns constructed of wood and sun-baked bricks, separated by wide forest belts. Its numerous tribal territories were under the loose suzerainty of a few kingdoms. Under the Maurya empire (ca. 324–187 B.C.), the Greeks (2d–1st cent. B.C.), the Scythians and Parthians (about the beginning of the Christian Era), and the Central Asian (Tocharian) Kushans and the Scythian Kshatrapas (1st–early 3d cent.), the country absorbed more and more of Iranian and Hellenistic civilization; and under the Śuṅga and Kāṇva dynasties (ca. 187–75, 75–29 B.C.) of the north and the Śātavāhanas (225 or ca. 100 B.C. to A.D. 221 or 249) of the south it reshaped its own tradition, first in the spirit of Buddhism, then in that of the "Brahmanical Renaissance." The new upper class of the great cities — hereditary chiefs, officials, rich merchants, courtiers, scholars, poets, and artisans — evolved a refined all-Indian culture.

In the 2d century this new civilization entered into serious competition with that of the foreign conquerors; between the 2d and 4th centuries first the Kushan empire (from the mid-3d cent. subject to the Sassanian emperors of Iran) and then the Kshatrapa kingdom of western India were superseded by the rise of Indian nationalism, under the Nagas of northern, then the Vākāṭakas of central, India. Early in the 4th century the Gupta empire was founded in Magadha (Bihar) by Candragupta I (ca. 315–28, 320 Gupta era). Samudragupta (ca. 328–76) expanded this empire over the whole of northern and parts of central India and invaded Orissa and Andhra. His son Candragupta II (ca. 378–414) overthrew the Kshatrapa empire, invaded even the Kushan states which had slipped from the control of the Sassanians, and obtained, through the marriage of his daughter Prabhāvatīguptā to Rudrasena II, control over the great Vākāṭaka kingdom of the Deccan. Even the tribes and the states that did not acknowledge Gupta suzerainty (the Kadambas, Gangas, and Pallavas in the south, Nepal, Kashmir, and Assam in the north) imitated the Gupta court and its refined civilization. Under Kumāragupta I (414–55) the empire reached its zenith, the mightiest and most glorious state and civilization to be found at that time.

Then the crisis set in. Internally there were tensions, since Candragupta II had moved his residence from Pataliputra (Patna), the old capital of Magadha, to Ujjayini (Ujjain) in Malwa, the former capital of the Kshatrapas. Externally his raid on Central Asia had weakened the late (Kidara) Kushans so much that they ceased to be a bulwark against other nomad hordes pushing southward. First, Tungus tribes under their king Muliyan (Mihiragula) invaded Kashmir and then the Indian plains. In their wake came, via Turkistan, the White Huns (also called Ephthalites). The Gupta empire was overrun; Kumāragupta had to flee. His son Skandagupta (455–67) succeeded in holding back the Huns. But under his weak successors all northern India was devastated, its cities destroyed, the wealthy middle class ruined. The power fell into the hands of the generals, who set up their own pretenders to the crown. Viṣṇuvardhana Yaśodharman at last expelled the Huns and made himself dictator over most of the empire (ca. 525–35). The Guptas lingered on in the eastern provinces until 543–74. The Vākāṭakas, who under Hariṣeṇa (ca. 480–515) had attacked the Guptas from the rear, were in their turn overthrown by the Kalacūrīs of the central Deccan.

The period from the late 6th century to the middle of the 8th century witnessed the struggle between the military dynasties of the Maukharis of Kanauj (dominant in the 6th cent.), the Puṣpabhūtis of Thanesar north of Delhi (Harṣavardhana, 606–47/8), the Guptas of Malwa, later of Bihar (dominant under Ādityasena, late 7th cent.), and finally the Maukhari Yaśovarman of Kanauj (?–753). During all these wars nomadic tribes who originally had fought in the Hun hordes, the Śūlikas and Gujars, attacked the frontiers of India but were defeated by the Maukharis and later the Guptas and reemployed as mercenaries and frontier guards. Gujarat and Saurashtra were held by the Maitrakas; in the Deccan the Kalacūrīs were expelled by the Nalas, until the Chalukyas of Vatapi (mod. Badami) subdued the Gangas of Mysore, the Kadambas, and the Nalas and conquered the whole Deccan and Gujarat (7th cent.). In the coastal plains of the Tamil country the Pallavas of Kanchi (Conjeeveram) became a great power (ca. 574–897), extending their influence as far as Ceylon, Indonesia, and even Cambodia. With the short-lived conquest of most of India by Lalitāditya Muktāpīḍa of Kashmir (724/25–56), the overthrow of the Chalukyas by the Rashtrakutas (Skr., Rāṣṭrakūṭa) in 753, and the rise (ca. 780) of the Gurjara-Pratīhāras of Rajasthan and Kanauj and of the Palas in Bengal (ca. 756) the Gupta age reached its end. It had become a mere relic surviving at the royal courts. Its original area, the flourishing provinces and wealthy cities of the 5th century, had been more and more depopulated and resettled with barbarian prisoners of war and mercenaries. A new society had evolved, dominated by an exclusive aristocracy and an arrogant priesthood. By the 8th century medieval Hindu civilization had taken shape, based on the Gupta tradition, but in many ways its antithesis.

ARTISTIC BACKGROUND. Because of their intellectual and missionary character, Buddhism and Jainism (qq.v.) had hitherto been the religions of the upper class all over India. But when Buddhism also spread to Afghanistan, Central Asia, and the Far East, it became the religion of the foreign conquerors. The national revival, therefore, sought support from the popular cults by integrating them, in the manner long practiced in the Hellenistic-Roman world, with the philosophies of the leading Brahmanical sects, the Bhāgavata followers of Viṣṇu and the Kāpālika or Lākulin devotees of Śiva, as well as with the ritual of the Brahman court priests and ministers. The Kushans and

Kshatrapas, and especially the Nagas and Vākāṭakas, had more and more turned to these syncretistic cults, mainly to Saivism. The Guptas, though tolerant of other cults, were devotees of Viṣṇu, especially in his incarnation as Rāma, the hero of the national epic *Rāmāyaṇa* and the ideal prototype of a national kingship. This implied a new direction in art: the creation of the Hindu temple and of a new, powerful figural art. And the time was ripe for such a reorientation. For "Buddhist" art, evolved from timber construction, wood carving, and clay modeling, had in the 2d–3d century reached the last possible stage of its stylistic evolution, highly involved, overdecorated, with elegant, very erotic figures in an almost illusionistic scenery. In the meantime timber was becoming rare and was being increasingly replaced by stone. But stone buildings imitating wood construction were as absurd as they were precarious. And figural art, which had grown naïve, had in the meantime encountered the very different Hellenistic canon of ideals, proportions, and types, and probably also the disparaging criticism of the foreigners.

This clash of ideas first became evident at Mathura — winter capital of the Kushans, international trade center, and a holy Buddhist, Jain, and Hindu place of pilgrimage — during the reign of Kaniṣka (late 1st?– first half of 2d cent.). In the architecture (known to us only from fragments and representations on reliefs) we still find the traditional Buddhist and Jain stupas and chaitya halls with their slim columns and rafters, rounded doors and windows, roofs, and relic shrines. At the same time, the reliefs show towers of several stories, apparently an experimental stage of the Hindu temple; and fragments of door frames have been found, generally of Hellenistic form, but decorated with Parthian floral motifs (as in early Palmyra) and with donor reliefs of Roman inspiration but Indian elaboration. In Mathura sculpture very few pieces of Gandharan or provincial Roman inspiration have been discovered. Generally their type is purely Indian, but with a new note. Instead of the naïve tradition still discernible in the works of the 1st century, there is a very conscious modeling, the evolution of an Indian canon of beauty and of proportions in contrast to the Hellenistic-Roman ideals: athletic, somewhat massive men, and women with rather small heads, languid eyes, plump necks, heavy breasts, slender waists, broad hips, and long, slim legs. Also, we now find a definitive canon of types for the Buddha and the bodhisattvas, the Jain tirthankaras, and the Hindu deities, evolved from the ancient statues of yakshas and yakshis (local genii), nagas and *nāgiṇīs* (snake godlings, mermaids), influenced by, but quite different from, the Occidental typology that the Gandhara artists had adapted for the Buddhist pantheon.

Gandhara and later art of western India. The overthrow of the Parthian empire by the Sassanians in 227 and the disintegration and subjection of the Kushan empire shortly afterward had fargoing consequences. The Parthian-Hellenistic artists (mainly of Seleucia on the Tigris), neglected by the Iranian chauvinism of the Sassanians, emigrated to Palmyra in the Syrian desert or to northwestern and western India and probably were followed by Hellenistic Syrians captured by the Sassanians and deported to the interior of Asia. To them we have to attribute the revival of Hellenistic art in Gandhara (q.v.) and its flowering under the Kidara Kushans (late 4th and 5th, locally even 7th, cent.; see KUSHAN ART), as well as the new wave of Hellenism in Central Asia and northwestern India. At Khotan and Miran in the Tarim Basin, Hadda, Bamian, etc., in Afghanistan, Harwan in Kashmir, Taxila and Agroha in the Punjab, Rang Mahal (Suratgarh, Bikaner) in Rajastan, Mirpur Khas, Thul Mir Rukan, Depar Ghangro, Sudheranjo-Dhar, Jarak in Sind, and Samlaji in Gujarat, we find, as in the best "early Gupta" seals, a very characteristic new style, more Hellenistic in some ways, more Indian in others. Its Buddhist architecture generally follows the later Gandharan type (small stupa proper on several platforms or drums); the Hindu temples seem to have consisted of a tower with a pyramidal roof, echoes of which we can trace in Kashmir and Kulu, but which experienced a late renaissance under the Maitrakas in Saurashtra (Gop, Visavada, Than). In the decoration the Hellenistic motifs are further simplified but are applied in a bolder manner, and indigenous Indian motives are added, especially the "chaitya window" arch, but broken up or reduplicated. The chaitya windows of the recently excavated Samlaji stupa (later than Viśvasena, 3d cent.) are utterly transformed by means of Roman wreaths and triglyphs, and enclose capped gable niches. The ornament (especially the leafwork) combines the grandiose linear rhythm of Parthian-Hellenistic art with Indian sensuousness. The figures combine the Tocharian dress with the curly locks of the Syrian fashion; those of the Buddha wear either the Indian (one shoulder uncovered) or the Gandharan (both shoulders covered) monk's costume. Often the divine figures (especially bronzes) are surrounded by a halo of pointed rays (*sphuratprabhāmaṇḍala*), like the Roman Sol Invictus. Their modeling first emphasized clearly defined, almost hard surfaces; later, however, it flowed over into the delicate softness of the Gupta style. It seems that this development reached its apogee in the late 4th century, when the persecution of the non-Christians in the Roman empire, inaugurated by Theodosius I, brought a last wave of refugees from the West. Unfortunately, the ruins of Ujjain in Malwa, from the time it was the Kshatrapa and Gupta capital, have not yet been uncovered.

The Indian transition style. We can follow the transition of Indian art proper both within the Kshatrapa kingdom and central India, and also in the northern Deccan and the Ganges plain. In the Jain caves of Dhank (Saurashtra) and the Buddhist ones of Dhamnar, Kholvi, and Bagh (I–III) the old timber style has been reduced to a mere ornamentation, the former pillars have become decorative pilasters without function, and the round chaitya windows are a meaningless cornice decoration, precursor of the *gavākṣa* ornament of the Gupta period. Real pillars of square or octagonal cross section, with simple brackets and horizontal lintels, have been introduced. The stupas, though still of the old hemispherical type, have become small and are placed on a high cylindrical substructure, sometimes rising in several steps. For the Hindu temple the old chaitya hall still was used — Trivikrama temple at Tagara (Ter) near Sholapur, Kapoteśvara temple at Chezarla in Krishna district, and possibly also Pakkī Kuṭī temple at Sravasti (Saheth-Maheth) — but executed on a rather small scale, in brick, sometimes duplicated, with an apse at both ends (as at Nagarjunakonda), or expanded by a pillared square cult hall (mandapa). But it was more and more superseded by a square chapel, probably with a flat or pyramidal roof (a conclusion we draw from subsequent architecture, as no complete building of this time survives). Like the Buddhist stupa, this shrine was raised on one or several platforms decorated with blind pilasters and small chaitya windows: for example, the Tīlā temple at Padmavati (Pawaya), similar to the Buddhist stupas of Mirpur Khas and Samlaji. The columns of these temples bore a sort of "Maurya" bell capital, on top of which were statues of the respective deities. Of this type is the Uparkoṭ at Junagarh (Saurashtra), two stories of rock-cut underground rooms, probably a summer palace of the last Kshatrapa rulers or their conqueror Candragupta II.

Farther east the centers of art development were the Naga capitals Mathura, Pawaya, and Vidisa (Bhilsa) in Malwa, Janakhat in Farrukhabad district, Kantipur (Kantit) in Mirzapur district, Sravasti, Kausambi (Kosam), Vaisali (Basarh), and Patna in the Ganges plains, and the Vākāṭaka capitals Purika and Pravarapura (Pawnar, 6 miles from Wardha), Bhandak (caves), and Deo Baloda and Nachna-Kuthara in central India. To what extent the temple reliefs and fragments at Mathura mentioned above belong to this period has not yet been clarified. The fragments from Janakhat reveal the same Parthian decoration along with pure Hindu figures (Gaṅgā). The Tīlā temple at Pawaya has already been mentioned. Only the foundations of the Viṣṇu temple at Basarh are left. The Śiva temple of the Vākāṭaka emperor Pṛthvīsena (middle 4th cent.) at Nachna-Kuthara seems to have been rebuilt in Gupta times.

In the sculpture of this period the new style evolved at Mathura was taken up, but the problems involved were not

really understood. In this turbulent time people appreciated only the solidity and strength, the possibilities for a new iconography. As a matter of fact, many sculptures are utterly barbarian, short, almost dwarfish, and of a stiff immobility, or squatting with knees wide asunder (Mathura, Bhinmal, Samlaji). Others are crude but strong, almost echoes of the pre-Kushan yaksha statues: Hanuman at Parkham, Narasiṃha from Besnagar, the colossi of Rup Bas (Rup-bad) in Bharatpur. Others continue the elegant late Śuṅga style (Trivikrama relief and dance scene, Gwalior, Archaeol. Mus.; Umā-Maheśvara group from Kosam, A.D. 458/59, in the Calcutta museum), or the Kushan type (Dance of Nīlañjana, Mathura, Archaeol. Mus.; Kṛṣṇa steles at Mandor), though with costumes revealing the survival of the older styles deep into the Gupta period (e.g., the statues from Pali in the Sardar Mus., Jodhpur, early Kushan style but with 6th-cent. wigs!).

Early Gupta art. The art produced under the first Gupta emperors, even during the early reign of Candragupta II Vikramāditya, seems to have been of the same type. The designs of their gold coins — modeled on Kushan and Roman prototypes — show powerful but rather plain figures, in simple costumes, to some degree still in the Kushan fashion (III, pl. 400). The same features we find in the Viṣṇu from Sonbhandar Cave at Rajagriha (Rajgir; Nalanda, Mus.), the Rāma and Trivikrama reliefs at Pasupatinatha (Nepal), the statue of Samudragupta's horse for the Aśvamedha (imperial) sacrifice (Lucknow, State Mus.), the Bodhgaya Buddha (A.D. 383), that from Mankuwar near Allahabad (448–49, provincial archaism), the Dīpaṅkara (Lucknow, State Mus.), some sculptures from Samlaji, Vala, etc., and especially the sculptures of the cave temples of Udayagiri. These 20 temples were carved from a ridge northwest of Bhilsa (Malwa) during the campaign of Candragupta II against the Kshatrapas and consecrated in his presence (inscriptions in Caves VI and VII) in A.D. 402 (additions 426). Here we find the basic concepts of Hindu mythology, Śiva lingas, Nandi, Durgā, Gaṇeśa, Viṣṇu, Ādi Varāha lifting the earth from chaos, Nārāyaṇa lying on the snake of eternity (Ananta), the Churning of the Ocean, etc., powerful but simple works. However, on the whole the iconography of this period still is undeveloped and tentative.

However, after the conquest of the Kshatrapa kingdom we find a completely new style born from the synthesis of Parthian-Hellenistic, Roman-Syrian, and Indian art. This influence of late Roman art was not an isolated phenomenon, for we can trace it also in music and dance, in the new turn of classic Sanskrit literature in the works of Kālidāsa, and in astronomy (the *Romaka Siddhānta* and the works of Varāhamihira; see II, col. 74). In architecture the *templum in antis* and prostylos emerged temporarily, along with a type of decoration on temple walls that persisted for a longer time. Characteristic of this phase are the entrance door, crypts beneath the sanctuary, true arches and vaults, coffered ceilings, helical columns, indented entablatures, "conch" gables, as well as scrollwork, garlands, laurel wreaths, capitals with projecting figures, "Erotes" (*gaṇas*), "bacchantes" (*surasundarīs*), "Victories" (*gandharvas* and *vidyādharas*), "hippocampi," and "Tritons" (*gandharvas*). This new style coincided with the persecution of the heathens by Theodosius I and must be connected with it. The reaction against it was not less vehement; the foreign imports were quickly Indianized and in the end served to strengthen the Indian currents already evident in the art of Mathura. However, the influx of late Roman art motifs continued until the 8th century, transmitted apparently through the Sūrya (Sol Invictus) cult, and finally by (Nestorian) Christians.

Classic Gupta art (under the Gupta emperors and the later Vākāṭakas). High Gupta art was mainly a product of the aristocratic and capitalistic upper classes (*nāgarika*) in the great cities (*nāgara*) and, therefore, was called *nāgara*, a term later applied also to northern Indian medieval architecture (excluding Kashmir and Bengal). Its ideals were shaped by the princes and rich connoisseurs and by the courtesan-actresses, dancers, musicians, poets, and the scholars they patronized. It was thus a highly conscious art, disciplined and learned, comprehensive and elaborate. But it had strong roots in the rising folk cults and in the well-to-do lower-middle-class population.

*Secular architecture.* The towns generally were open and spacious, with groves, gardens, ponds, and artificial lakes (one of the most conspicuous features of India). On the embankments of the lakes were ghats, temples, and pleasure houses. The ponds were excavated and often framed by flights of steps. Only the center of the town was fortified, with high earthworks faced with bricks and surrounded by a broad moat (Gaṛh-Kālikā at Ujjain, Samlaji, Aihole, Sigiriya in Ceylon). The gates, flanked by projecting bastions, gave access to the main roads, generally meeting in the center of the town, at the royal palace, a temple, or a public hall (*mandapī* > *mandavī* > *mandī*; *caturaṅga*). In some cases we find also an inner citadel on some almost inaccessible cliff, as at Bhilsa, Aihole, Badami, Sigiriya (III, pl. 176), etc. The *Daśakumāracarita*, *Arthaśāstra*, *Rājataraṅgiṇī*, and other Sanskrit texts give us descriptions of the palaces: a fortified enclosure, many courts, audience halls for public representation (*āsthānamaṇḍapa*) "towering like cloud banks," the prince's private rooms with secret doors and passages and other precautions against conspiracies, the ladies' quarters (*antaḥpura*), and vast gardens with ponds, light wooden pavilions (some on artificial hills), and underground rooms and baths for the summer. Though lost in India, well-preserved contemporaneous examples still exist in Ceylon (Anuradhapura, Sigiriya). The palaces were constructed of wood and brick but luxuriously decorated with gold leaf, paintings, sculptures, silk, jewelry, etc. (The ancient descriptions are corroborated by later Portuguese accounts of the royal palaces at Vijayanagar.) The ordinary houses generally were laid out in rectangles around one or several courts, accessible from narrow side lanes branching off from the main road. The fortified town center was reserved for the court, the households of the ministers, princely hostages, great bankers, and other high dignitaries.

*Hindu temples.* In the time of Candragupta II the Hindu temples (*mandir*, *prāsāda*) still were very simple. Many [Sanchi XVII and XXXI, Mukunddarra and Udaipur in Malwa, Uchahara, Garhwa (?), Samlaji-Devnimori, Tigowa in Jubbulpore district] were not yet erected on a platform. The cella (*garbhagrha*) was approximately a cube (*caturaśra*) with a flat, double roof (Samlaji, Pataini Devī temple at Uchahara; in Cambodia copied at Sambor Prei Kuk and Hanchei). By the addition of a pillared porch (*mukhamaṇḍapa*) it became temporarily very similar to the Roman-Syrian prostylos or the *templum in antis* [Sanchi XVII (pl. 140), Tigowa, Udaipur, later Mahua near Gwalior; one partly excavated from the rock at Udayagiri]. The frame of the entrance to the cella, based on the Roman model, was, however, decorated with panels of protective godlings (yakshas), generally in couples (*mithuna*), and the square or octagonal pilasters were adorned with traditional figural capitals.

But in the course of the 5th century the Hindu temple, now generally constructed of heavy stone blocks, assumed its characteristic shape, though still far from the later elaborate type of medieval times. The indigenous tradition reasserted itself. The sanctuary was placed in the center of a broad square platform (*medhi*), first of rather modest size (35 ft. square; 3 ft., 8 in. high), but soon extended in front and growing to a length of 118 ft. and a height of 9 ft. (examples at Ahichchhatra-Kampilya in Uttar Pradesh, Bhitargaon, Bhumara, Chamba Town, Deogarh, Kotivarsha-Bangarh, Manora, Nachna-Kuthara, Nagari near Chitorgarh, Nalanda in Bihar, Pundranagara-Mahasthan, Sarnath, Sirpur in Madhya Pradesh, Sravasti, Udayagiri in Malwa). Also, at Pawaya, Ahichchhatra, and Mahasthan (west temple) several terraces were piled one on top of the other. On this platform the public could attend the religious service, see the temple dances, or circumambulate the shrine (*pradakṣiṇāpatha*). For this purpose an open mandapa was often added in front of the sanctuary [e.g., Viṣṇu (Daśāvatāra) at Deogarh, Mahādeo at Nagari, Temple XIII at Nalanda, Kachī

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

Kuṭī at Sravasti], or the shrine was surrounded by a covered gallery for the circumambulation (*sandāra-prāsāda*) [e.g., Pārvatī temple at Nachna-Kuthara, Baigram in Dinajpur district (Bengal), Gop, Bileshwar, and Kadvar in Saurashtra (later, but archaic)]. By the side of the steps leading up to the platform (e.g., Mahādeo at Bhumara) or at the four corners of the platform (*pañcāyātana* type, first at Deogarh) subsidiary chapels for the prominent gods not venerated in the principal shrine were set up. Often also a pillar (developed from the flagstaff, *dhvajastambha*, of the village shrine), carrying an image of the deity or of its sacred animal (*vāhana*), was set up outside, as at Bayana-Vijaymandargarh, Bhitari (A.D. 456), Bilsar (A.D. 415/16), Eran (A.D. 484/85), Delhi — from Mathura, of 6 tons of non-rusting steel — Garhwa, Mandasor (A.D. 528), Kahaon (Jain, A.D. 460/61), Rajghat near Benares (A.D. 476/77), Sanchi XXVI, XXXIV, XXXV.

The sanctuary proper grew into a tower, generally of square ground plan, occasionally also with a transversal axis counterbalancing the projection of the porch (*áyatāśra* type), as in the Navadurgā temples at Jageshwar (PL. 142) and Bhitargaon; the 8th-century temples of Teli-kā Mandir and Naresar near Gwalior; the 9th-century temple of Vaitāl Deul at Bhuvaneshwar; and the temples in Farther India: Prasat Bayang and Banteay Prei Nokor in Cambodia, Mi-sön in Champa (III, PL. 193). The tower originally consisted of two (*dvitala*) or three (*tritala*) genuine stories, originally dedicated to the heavenly or esoteric aspects of the deity venerated (shrines in Buddhist monasteries, Nagari, Nachna-Kuthara, Bhumara, Manora, in Kaimur Range, Aihole, and, later, Mamallapuram and Conjeeveram in the south). But by the time of the last years of Kumāragupta (Mandasor inscription), these stories were fused into one spire (shikara) of merely symbolical character, representing the mountain of the gods (Kailasa) or the world axis (Meru, Mandara; see IV, col. 811), similar to the Babylonian ziggurat. In contrast to south India, where the individual stories (*bhūmikā*), though reduced to miniature proportions (*pañcāram*), retained their distinct shape, the stories were in classic Gupta art degraded to a mere surface ornament, as at Nachna-Kuthara (Śiva temple), Deogarh, Makanganj, Nalanda, and in Java (Caṇḍī Bhīma and Gunung Gangṣir); the top story ended in a heavy wheellike coping stone (amalaka) or, in the case of an *āyatāśra* temple, in a wagon roof. The interior of the shikara formed one corbel vault, and sometimes two, though true vaults were occasionally used in Gupta times (Bodhgaya, Bhitargaon, and, later, Mul-Dvarka in Saurashtra).

The decoration of the temple represented a fusion, a reinterpretation, of traditional Indian and Roman-Syrian motifs. The plinth (*adhiṣṭhāna*) consisted of a sequence of angular and rounded molding courses (*bandha*) repeating, in miniature, the general build-up of the façade, that is, plinth, wall (*harmya*), cornice (*grīva*), eaves (*chajja*), and roof (*pīḍa*). The walls had niches (*rathika-bimba*) enclosing mythological reliefs (at Nachna-Kuthara they were carved with cliff scenery), either in the center (e.g., Deogarh) or alternating with pilasters (e.g., Bhitargaon). These niches were at first square, then enclosed in round arches, at last topped by a *gavakṣa* (ornamental chaitya window). The panel friezes (*śākha*) of yakshas, nagas, and *mithunas* around the entrance (*dvāra*) to the sanctuary were combined with scrollwork (*paṭrāvalī*; in which sometimes yakshas or *gaṇas* are climbing), or "Buddhist railing" posts, or traditional "wooden" columns with cushion capitals. The lintel friezes showed scrollwork with gandharvas flying toward a "crown" (the Roman acanthus basket) or a projecting coping stone (*dvāralalata-bimba*) with the image of the temple deity or of its *vāhana* occupying the place of the Roman reliefs of the emperors, Jupiter, or Sol Invictus. The Roman corner volutes were replaced by lions rampant, then by the goddesses of the holy rivers Gaṅgā (on a crocodile, or *makara*) and Yamunā (on a tortoise, or *kūrma*), in their turn transformations of the tree goddesses (*vṛkṣakā*) of the Buddhist stupa gateways (toranas). At the foot of the door jambs figures of dwarfs (from whose navel the scrollwork was growing), snake kings (*nāgarāja*), temple guardians (*dvārapāla* or *pratihārī*), princely donors, and the river goddesses were added.

Above the massive pillared porch (*mukhamaṇḍapa*) was a window, as in the Buddhist chaitya halls, by which the idol was illuminated. The stories of the shikara were embellished with the figures of various deities or simply with heads looking out of the blind windows (*gavakṣa*). On top of the amalaka there stood a stone vessel (*kalaśa* or *stūpī*).

The pillars (stambha) of the porch or the hall in front of the temple were, like those of the sanctuary, originally either square pilasters ending in a highly simplified Parthian-Kshatrapa acanthus capital or in a cross bracket or were round (plain, fluted, or helical) columns ending in a cushion capital (*kumbha*). The two types were soon combined, with many variations. For example, the shaft might be composed of both square and 8- or 16-sided sections (the transition being obtained by the old Buddhist semiroundels, *ardha-cakra*); at the top it might return again to the square shape or end in a capital. The capital became either a fusion of the cushion and Doric capital, or the pot-and-foliage capital, and then a fusion of the cushion with the acanthus capital, the transition being exemplified at Bhitargaon.

*Buddhist sanctuaries.* Under the psychological pressure of Hindu theism, Buddhism had also turned into a cult of saviors (bodhisattvas), and protective deities, and Buddhism regained its prestige during the peaceful reign of Kumāragupta I and especially under the last Gupta emperors. In consequence, the chaitya hall focused on a chaitya (small stupa) disappeared. Its last examples are Caves XIX and XXVI at Ajanta (PLS. 140, 141, 454; II, 381), ruin No. XVIII at Sanchi, and the Viśvakarmā Cave at Ellora (ca. 600); these were covered all over with reliefs and paintings: the historical Buddha and his presumed predecessors teaching, surrounded by bodhisattvas and monks, scenes from his life (Avadāna) and from his previous lives (Jātakas), often mere pretexts for genre scenes of rather secular character. Also, the earlier chaitya caves at Kanheri, Bhaja, Bedsa, Karli, etc., were redecorated with reliefs of Buddhas, at times colossal, and murals.

Instead, the chaitya, or in its place the Buddha image, was accommodated in a chapel at the back of the monastery (vihara) court, which later was transformed into a mandapa. Of monasteries built in stone only ruins survive at Sarnath, Sanchi, Kusinagara (Kasia), Samlaji, etc.; the sanctuary sometimes has a second story, as in the early Hindu temples. Much better preserved are the cave monasteries (most of them erected under the Vākāṭakas and Kalacūrīs) at Bagh (III and IV), Ajanta (most of them carved out in the 5th–6th cent., though paintings were executed up to the 8th cent.), Ghatotkacha, Kondivte, Aurangabad (esp. III), etc. Their front verandas, halls, and chapels are lavishly decorated with pillars carved with jewelry, flowers, and *mithunas*; arches springing from the mouths of crocodiles (*makara-toraṇa*); reliefs of the life of the Buddha, river goddesses, and *mithunas*; and murals of flowers, innumerable Buddhas, and Jātaka scenes. The stupas grew to high towers of purely symbolical character; however, few of the 5th century have been preserved (e.g., several near Rajgir, Rāmābhār at Kasia, Dharmarājika and Caukhandī at Sarnath), as most of them were enlarged in subsequent times. Now the temple became common also in Buddhist places of pilgrimage, either a square or oblong cella on a platform (e.g., the earliest chaityas at Nalanda, the temples of Mūlagandhakuṭī and Kumāra Devī at Sarnath, Nirvāṇa temple at Kasia) or evolving from the chapels arranged on the four sides of a stupa (e.g., Paharpur, first stage). In the latter case the stupa drum was fused with the image shrine, the secondary chapels with the image niches on the temple walls; this temple tower was crowned by a small stupa, and the chapels at the four corners of the temple platform were replaced by small stupas. The most famous Buddhist temple is the Gandhakuṭī of the Vajrāsana (or Mahābodhi; PL. 133) at Bodhgaya, already in Kushan times a tower of about five stories (represented on a terra-cotta plaque found at Kumrahar near Patna), rebuilt in early Gupta times, again rebuilt by Narasiṃhagupta Bālāditya in A.D. 526, by Pūrṇavarman (a feudatory of Harṣavardhana of Thanesar) in the early 7th century, probably enlarged in the 8th century,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

and restored by the Burmese in A.D. 1105, 1298, and 1880–81. It is a huge shikara on top of a platform with four corner chapels; the image is in a vault in the substructure and the platform is accessible by two covered staircases. The design (especially the genuine vaults, the rounded image niches, and huge blind chaitya windows) probably goes back to Bālāditya's reconstruction; the dimensions of the present building, however, reveal the ambitions of the 7th and 8th centuries. An exceptional case is represented by Māniyār Math at Rajgir, a small stupa dedicated to the godling Māṇibhadra and decorated with delicate stucco figures of snake gods and goddesses, the god Śiva, the demon king Bāṇāsura, a linga, etc.

*Ideals of figural art.* Under Candragupta II and Kumāragupta I the representation of the figure assumed its characteristic shape. The new ideals, utterly different from those of the Mediterranean and Semitic-Iranian world, embodied all the sensuous exuberance of a tropical country, especially an intensive love and understanding of nature, flowers, animals, the moods of the day and the season, as well as a great erotic excitability, physically and emotionally. The artistic response was expressed in a great musicality and rhythmic modeling. The flesh, the plants, animals, human beings, and gods almost seemed to be alive. There was an emphasis on erotic portrayal — languid eyes, full necks, cuplike breasts, slender waists, broad hips — but it was nonetheless healthy, frank, and natural. We feel an exuberant imagination reaching from this visible world to the depths of a universe almost as infinite in space and time as that of modern science, and expanding into spheres of thought almost as abstract as those of modern mathematics. But all this exuberance of the senses and of the imagination is kept under control by Yoga, the will to master the senses, to sublimate and refine, or even to suppress them, and by a methodology so elaborate and abstract as almost to be lost in pedantry.

Indian art theory, as evolved since Gupta times (the *Nāṭyaśāstra* by Bharata, the *Viṣṇudharmottara*), regards the esthetic experience as a sort of mystic empathy by means of which man's feelings are brought into harmony with the divine. The basis of all artistic creation is the mystic evocation of the ideal prototype through concentrated meditation; implied in this experience is that every form, every color, and every object assumes a more than direct meaning and becomes a symbol, and that their interrelation becomes the expression of whole chains of associations and thoughts. The formal starting point, according to the *Viṣṇudharmottara* (part III), is music, especially rhythm (highly elaborated in India). The common link to figural art, however, is the dance, sculpture and painting being hardly more than its fixations. The classic Indian dance (Bhāratā-nāṭyam) is much more elaborate than the Occidental ballet, inspired both by rich folk tradition and (probably) by the imperial Roman pantomime (as described by Pliny and Seneca), which, in its turn, had systematized the gesture language of the ancient Near Eastern cults. As a result, Bhāratā-nāṭyam can express not only abstract, purely decorative movements and poses but also narrate, through a single dancer, whole myths and poems, including the scenery and imagined partners and even their "unspoken" thoughts and subconscious reactions, by means of complicated combinations of poses, gestures, and expressions comparable only to the score of a modern opera or symphony.

Thus there developed a subtly systematized iconography of gods and goddesses, kings and queens, princes, ministers, Brahmans, and low-class people. In the immense pantheon which had developed, each deity was distinguished by its special group of postures, attributes, expressions, etc. The principal religious systems had absorbed many local deities, considered as majestic, benevolent, or terrible aspects of a few major gods and goddesses, in their turn the trinity and quaternity of the one godhead; others were interpreted as their incarnations (*avatāra* and *mūrti*) or family and attendants. Each of these individual types was allotted a different position in the various religious systems. In this iconography behavior, expression, and movement were characterized and classified according to *sthāna* and *āsana* (standing and sitting postures), *bhaṅga* (bend of the body), *hasta* and *pāda* (arm and foot positions), movements of the eyes, the neck, and especially the hands (*mudrā*), by means of which every slightest emotion could be expressed.

These many details again were held together by a flowing rhythm, a strict composition, a canon of proportions (*talamāna*) and of refined manners (these classified in the dance) and even of expressions of the face — at least in official art; for in the Gupta terra cottas we find a great freedom of expression, even of freakish gestures. Typical of this refinement were the carefully arranged curled hair, the delicate jewelry, and the often richly decorated transparent costumes, of a material as thin as cobwebs, which adhered closely to the body.

*Sculpture.* Sculpture was used for the decoration of temples and palaces, for votive steles, temple images, and small votive or house-shrine images. There were also terra-cotta (occasionally stone) reliefs illustrating scenes from the *Mahābhārata* and *Rāmāyaṇa*, the dramas and poems of Kālidāsa, Bāṇa, Bhavabhūti, etc., and even grotesque or satirical harem or folk scenes (from Mathura, Kurukshetra, Chausa, Kasia, Pelwa, Newal, Kosam, etc.). Most of them may originally have been intended for the decoration of palaces. Their style generally is very free and has in common with official art only the costume of the time. Of a similar type are terra-cotta plaques from minor, mainly provincial, brick temples depicting gods, demons, and well-known mythological subjects (Sravasti, Ahichchhatra, Paharpur, etc.). Finally, the terra-cotta figurines (house idols, votive images, dolls, toys, etc.) found all over northern India, some of them prepared by means of molds, reflect the official style much more. The great bulk of the sculpture, however, is comprised of images in stone or bronze (*aṣṭadhātu* = eightfold alloy) and mythological reliefs in stone which once decorated the walls of the temple platforms; the best examples are the Viṣṇu (Daśāvatāra) temple at Deogarh (PLS. 226, 458, 459) and the Paṭṭharghaṭṭi temple at Nalanda.

As classic Gupta art emerged after the conquest of the Kshatrapa kingdom by Candragupta II, its early monuments are found mainly in western and central India (Besnagar near Bhilsa, Sanchi, Jhalawar, Mandasor in Malwa, Samlaji-Devnimori, Kotyarka, and Akota in Gujarat, Valabhi in Saurashtra, Brahmanabad in Sind, Bhumara and Manora in central India). At first the modeling was rather clumsy: the legs were almost like columns, the arms like sausages, the hands and feet broad, almost animalish, the chest like a log, the face broad and expressionless; in contrast the costume was daintily treated, in fine, but conventional, folds. Over the transparent loincloth or skirt (*jhaṅgikā*) another cloth was wound, forming a big loop at the hip and falling down to the feet; that of the men was twisted like a rope, that of the women spread out over one thigh; its ends, like those of the underdress proper, formed delicate zigzag folds. The hair fell down in heavy locks, when not covered by a crown; miters (*kirīṭamukuṭa*), often flattened, still are reminiscent of the (much lower) Kushan crown in Gandharan art; the halo, round or oblong, was decorated with pointed rays. But soon the modeling became more sensitive, movements gracious, the expression lively, though the bodies continued to be heavy; the hair, in distinct corkscrew curls, looked almost like a small parasol (*chatrākara*).

Under Kumāragupta the classic style assumed its definitive shape and spread over the whole empire (known examples from Kasma in Rajasthan, Bagh, Badoh, Sanchi, Besnagar and Bilsar in Malwa, Bhumara, Khoh, Garhwa, and Gwalior in central India, Mathura and Sarnath in the upper Ganges plains, Kasia and Sultanpur in Bhagalpur district in the east, etc.). The modeling now reached its apogee, always idealized and suppressing inessential detail, but anatomically sure, strong, and noble. Its masterpieces are the famous Buddha statues from Mathura and Sarnath (PLS. 134, 138, 452, 453, 462; II, 380) and the Khoh linga with the majestic face of the god Śiva, in all of which the flesh has become the vessel of an overwhelming spirituality. Both the earthiness and daintiness of the preceding style phase have disappeared. The costume has become simpler, though so transparent that the body un-

derneath is visible; the twisted overscarf is gone, except on bodhisattva figures (PL. 135). The male hair falls down in a mass of locks (*alakāvalī*), the female hair is built up in a "trefoil," that is, two masses falling down on the sides, but forming a sort of knot on the crown of the head; a variant was the Bhramarka fashion, with loose curls falling over the forehead. On the other hand, the ornament has become much richer: jewelry and rich textile designs on the figures, miters like short cylinders decked with jewels, round halos ornamented with floral scrolls, similar scrolls and jewelry motives of immense verve covering all buildings.

The gold coins of the Gupta emperors are the most beautiful in India, equaled only by those of the Indo-Greek kings and of the Moghul emperors. Originally inspired by those of the Kushan and Roman emperors, a great variety of designs soon evolved. Some represented the emperors carrying a Garuḍa standard, battle-ax, or sword, walking under an umbrella, riding on a horse or an elephant, slaying a tiger or a rhinoceros, in the company of the empress, or playing the lyre; others showed religious symbols, such as the conch or Garuḍa of Viṣṇu, Kārttikeya (the patron deity of Kumāragupta and Skandagupta) on his peacock, the horse of the imperial sacrifice. On the reverse the Roman Tyche, sitting on a throne, a cornucopia in her hand, was first transformed into the goddess Lakṣmī or Ambikā, and at last replaced by a purely Indian type, sitting cross-legged on a lotus. These designs are less naturalistic than those of the Indo-Greeks and Kushans but excel in decorative pattern and rhythmic *élan*. After Skandagupta (A.D. 467) the coins quickly degenerated, both in monetary and artistic value. Later Hindu dynasties produced only a very poor coinage.

However, the overwhelming vitality of the time of Candragupta II and the spiritual vigor of the early reign of Kumāragupta were superseded in Kumāragupta's later years by elegance and effeminacy, and nobility became mere manners. Modeling became conventional, even pronouncedly mannered, the figures overelongated and ill-proportioned, with overthin arms and legs.

Then the empire disintegrated under the attacks of the White Huns. In the more protected east, where the Gupta dynasty lingered on until the middle of the 6th century, that soft, elegant style continued to flourish, refined, sensuous, and tired, corresponding to the ornate Gauda style in literature. In the west, which had to defend itself against the barbarian raiders, art remained simpler and stronger, corresponding to the Vidarbha style of literature. For here its center had moved southward, into the Vākāṭaka kingdom of central India and the northern Deccan, which had regained its independence when the Gupta empire began to disintegrate. Vidarbha (in Berar) was the province where its successive capitals Vatsagulma (Basim), Purika, and Pravarapura were situated, but none of these cities has survived. The world-famous cave monasteries of Ajanta (q.v.) are the most glorious monument of later Vākāṭaka art. But the sculptures of Ajanta cannot compare with any creations of genuine Gupta art. The earlier ones are of a somewhat lifeless, noble dullness. The later ones, sensuous but weak, with a predominance of juvenile types and pervaded with a passive melancholy, reflect the decadence of Gupta society.

*Painting.* Painting was highly developed. Society people (*nāgarika*), men as well as women, courtesans, and even maidservants were expected to be capable of drawing a fairly recognizable likeness and to judge the merits of a picture. Murals were common in temples, palaces, and rich mansions; even picture galleries (*citraśālā*) were known. The masses were familiar with the *yamapaṭas* that Buddhist and Jain monks as well as Hindu ascetics used for the illustration of their sermons. But very little has survived of all that: at Dengaposhi (Keonjhar district, Orissa) some paintings in a rock shelter, probably of the time of Candragupta II; some murals in Cave IV at Bagh (ca. 420–30); and murals in the Ajanta Caves XVI and XVII (end of the 5th cent.; PL. 457; I, PLS. 43–45, 47, 48; II, 381). The first (processions) still conserve the simplicity of the early classic style; the second (a procession, girls dancing a *garba* around a foreigner, two weeping women), now almost completely faded, are vigorous both in style and expression; the last (illustrations to Āryaśūra's *Jātakamālā*, interpreted as secular genre scenes) show Gupta painting just beyond its zenith, technically perfect, but slightly overornate, effeminate, and tired. The technique everywhere is the same: a strong outline drawn on a thin layer of fine plaster, filled in with simple surfaces of vegetal or mineral colors. There is no shading, but a certain picturesque effect is obtained by a carefully elaborated overlapping of details and balance of colors. The individual figures have been well observed, though idealized; the scenery has a crude perspective in detail, but as a whole is built up, sometimes in continuing narration, as if rising on a hillside of curiously stylized cliffs.

THE DECLINE OF GUPTA ART. With the disintegration of the Gupta empire the character of Indian classic art underwent a change similar to that of the Italian Renaissance in the 16th century or of Roman art from the 3d century. Of the former numerous upper class, rich and cultured, only the courts of military emperors claiming semidivine status and an aristocracy of warring feudatories and mighty priests survived. The country was impoverished, the power of the individual princes and nobles insecure. Art had to be impressive and pompous, but quickly and cheaply executed. It became routine work, evolving well-established formulas to obtain the maximum superficial effect. But the underlying mood was rather resigned, tending toward pessimism and mysticism. What under the Gupta emperors had been a high ideal now became a canon of divine authority to be observed slavishly. Furthermore, the breakup of the empire into a number of new monarchies inaugurated the evolution of new local styles, resulting not only from the differences of local background but also from the incapacity of employers as well as artists — many risen from the ranks or even foreign barbarians (as in the late Roman empire) — to understand and appreciate the intentions of classic Gupta art.

*Late architecture.* The palaces (of which none survive) had to be replicas of the mountain of the gods, Kailasa (inscriptional evidence). The Buddhist monasteries became huge buildings, sometimes several stories high, with projecting monumental gateways (Sarnath, Sanchi No. XLV, Nalanda, Sirpur; Paharpur and Mainamati-Pattikera in East Pakistan). Also, temples and stupas had to be impressive. Either they were raised on pyramids of successive platforms, long flights of steps leading to the central sanctuary (stupas at Nalanda and Lauriya Nandangarh, Paharpur, Caṅkuṇa stupa at Parihasapura, Kashmir). Or stupas or chapels projected from the corners of their platforms (Nalanda stupa; additions to Deogarh temple; Gop). Or they were enlarged to monumental dimensions (Dhāmekh stupa at Sarnath, Kesariā stupa, renovation of the stupa at Manikyala by Yaśovarman of Kanauj; Yaśovarman's Teli-kā Mandir on Gwalior Fort; Parihasapura chaitya; central temple — now lost — at Ajanta), especially when they had to house a colossal metal image visible from a vast distance. In addition, groups of many modest temples were set up by ambitious feudatories anxious to gain the support of an influential priestly party (Deo Barnarak, Naresar, Jageshwar, Osia, Aihole).

Simultaneously, the temples became increasingly elaborate. A high shikara became the rule, at first still a succession of stories (e.g., Lakṣmaṇa temple at Sirpur) later more and more often covered with a continuous ornament of *gavakṣas*. Their ground plans became more complicated by repeated projections and recessions of the façades, at last star-shaped (e.g., Muṇḍeśvarī at Bhabua, Bihar, A.D. 635; brick temples of Kharod and Pujaripali in Madhya Pradesh; Kherat in Malwa; Sona Tapan and Chinpur near Bankura in West Bengal, etc.). First (in the 6th cent.) the open mandapa in front of the shikara shrine was replaced by a cult hall (vimana) with three naves beneath slightly sloping roofs (Aihole in the Deccan; Lakroda in Gujarat; the Paraśurāmeśvara temple at Bhuvaneshwar in Orissa; Jageshwar, Bageshwar, Baijnath, Dwarahat, and Palithi in the Himalaya). Then, in the 7th century, the plain exterior of this vimana was designed like a series of small chapels (Meguti at Aihole, A.D. 634, Malegitti Śivālaya at Badami; Pattadakal; early Pallava temples), or the open pillar hall (still found

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

at Pathari and Osia) was closed by a balustrade (Osia; Kālīmātā and Kṛṣṇa temples at Chitorgarh). Finally, combinations of several shikara shrines into one building were attempted (Ṭhākurdvāra at Masrur, Kangra Valley; Dharmanātha at Dhamnar). But this last development found its consummation only in Greater India, in the stupa and temple on a pyramid of terraces, and some other types of this period.

Also, the decoration of the temple was elaborated more and more. The image niches and projecting chapels on the three sides (the fourth being the porch) were crowned by first one, then three, then five or more *gavakṣas* until these latter formed subsidiary shikaras. Their number increased, and they housed not only the images of the great deities (Śiva, Viṣṇu, Sūrya, Brahmā, Kubera, later Gaṇésa and Durgā) but also of the guardians of the nine points of the compass (*parivāradevatā*). Around the entrance the figures of the seven planets (later nine, by the addition of Ketu and Rāhu, personifying the waxing and waning moon, i.e., the *navagraha*; see II, col. 75) were arranged, and the remainder of the wall area was decorated with scrollwork, jewelry, and minor godlings.

The Buddhist cave monasteries reached the apogee of their splendor in the early 6th century (last monasteries at Ajanta, Aurangabad, Kanheri, etc.). But as the number of monks began to dwindle, many became mere temples with or without a circumambulation passage or cella for the guardian monks (Ajanta VI, Aurangabad VI and VII, Ellora VI and VIII); in the chapel proper many statues, of the Buddha, bodhisattvas, monks, and donors, were set up. This type of monastery was taken over in Central Asia (Ming-oi, etc.) and China (Tun-huang, Yün-kang, Lung-mên). It reached its most elaborate form in the Do Thal and Tīn Thal (Caves XI and XII) at Ellora, the image-filled halls of which remind one of Far Eastern temples.

With the rise of the Saiva Kalacūrī dynasty the Brahmanical cave temple developed, originally of the same ground plan as the Buddhist cave temple (one or several cellas with or without a circumambulation passage, at the back of a pillared porch). The oldest one is the beautiful Rāmeśvara (XXI, early 6th cent.) at Ellora; next come the Nīlakaṇṭha (XXII) there and the minor caves at Elephanta; lastly (end 6th cent.) the four cave temples at Badami. The next step was that a linga shrine was placed in the center of a vast hall and of surrounding courts (oldest, Jogeśvarī Cave near Bombay, 6th cent., then the great cave at Elephanta and the Sītā-kī Nahānī at Ellora, which cover the end of the 6th and part of the 7th cent.).

*Late sculpture.* By the time of Kumāragupta I a certain mannerism had emerged in which all body forms were reduced to almost mathematical shapes. This tendency continued during the subsequent centuries, without, however, for the time being, undoing the naturalistic general impression of the figures. The 6th century, with its mixture of tragedy and heroism, developed pronouncedly "baroque" ideals. A type of superman (savior) found expression in gigantic statues: Bamian in Afghanistan, the "Great Bodhisattvas" and Buddha images at Ajanta, the huge *dvārapālas* and bodhisattvas at Jogeśvarī, Elephanta, Ellora, etc. Its female counterpart was a woman dragged down by the heaviness of her immense breasts and broad hips (e.g., Ajanta Cave I, river goddesses at the Kharod temple, etc.), as described in the then-developing Gauda style of poetry. Characteristic of these statues are the immense periwigs (*alakā*) worn by the men, which later became balloon-shaped crown-caps, and the "pot" style (*kumbha-bandha*) for the women (later terra cottas, Lakanātha from Sarnath, Sondani sculptures, reliefs in Ajanta Cave XXVI, Jogeśvarī, bust of a woman from Gwalior, etc.), and a growing predilection for excessive jewelry, innumerable pearls, and costly crowns. This latter fashion led to a reversion of the hair style in the late 6th century, the hair being bound up on top almost like the ascetics' hair style (*jaṭāmukuṭa*) and pushed into a jeweled miter. Toward the end of the century the figure type again became less exaggerated, as exemplified in Lakhamandal, Elephanta, and Ellora (PLS. 467–69). In the 7th century it became slim and elegant, even overelongated, in the east rather anemic and of an almost metallic hard cut (Siddhaikavīra from Sarnath, Samantabhadra of Nalanda), in the west soft and badly modeled (Kaman, Gaṅgā on Kangra Fort, Kanheri, late Ajanta reliefs, etc.), in the south still retaining a healthy character (Aihole, Badami, Mamallapuram, Talkad). Concurrent with this, the crowns became high cylinders, and the halos (elliptical and framed by a fringe of flames by the 6th cent.) were dragged out, like long, slim steles. In the 8th century the figures lost their sensitiveness, the costumes their delicacy, and the movements became unnaturally exaggerated (Teli-kā Mandir at Gwalior, Naresar, Masrur, Osia, etc.).

Technical competence was high, not only in stone, but also in the casting of bronzes (Brahmor in Chamba; Jageshwar and Katarmal in the Himalaya; Mainamati in East Bengal; Nalanda and Kurkihar in Bihar; Akota, Vasantgarh, and Lilva-Deva hoards in western India; Raipur, Sirpur, and Sopara statuettes in the Deccan), in many cases inlaid with gold, silver, and copper, and sometimes of considerable size. Of the colossal metal statues mentioned by the historians not one has survived. Numerous new iconographic types, mainly the religious imagery of Hinduism and Mahayana Buddhism, were created, although many resulted from mutual borrowings and adaptations. Small-size models and sketches seem to have played an important role in this process.

*Late painting.* The same trends can be traced in the murals surviving at Bagh (Cave III), Ajanta (especially Caves I and II), Bhaja, Bedsa, Pitalkhora, Ellora (VI and XII), Aihole, and Badami (Cave IV). The "baroque" style of the 6th century (Badami, Ajanta II) was superseded by an elegant style in the murals and renovations of the 7th century, very charming and rich in inventions, though of a somewhat immature fashion-plate character, and amazingly erotic for the habitations of monks. However, in the former imperial capitals the best creations are lost, though we can get some idea of their splendor from their echo in the Buddhist murals of Central Asia and China. The last style phase, however, evidently executed by means of stencils, was clumsy: first, excessively elongated figures, almost dolls; at last, completely without proportion or expression.

*Minor arts.* Very little is preserved, except for fine seals and a few rings. But what we find depicted in sculptures and paintings reveals a very high quality, especially of textile work, jewelry, weapons, etc.

THE END OF GUPTA ART. By the end of the 6th century a breakup into the more elaborate "Eastern School" of the Middle Ages and the simpler "Western School" (under Śīlāditya I Dharmāditya of Valabhi, ca. 595–612) had set in. In the course of the 7th century quite a number of local styles began to evolve an individuality of their own. In Assam it was rather simple (Dah-Parbatiya, Tezpur district). In Orissa there was a slightly barbarian interpretation of the eastern Gupta style, Hindu under King Śaśāṅka of Gauda (Paraśurāmeśvara temple; later, Vaitāl Deul at Bhuvaneshwar) and in Khiching and Mayurbhanj, Buddhist under the Bhaumakara kings, especially Śubhākaradeva (Nalatigiri, Udayagiri, Ratnagiri, Sholapur). In Nepal the local art still existing in our time started with the sculptures of King Mānadeva and the Buddha statues on Sambhunatha hill; the exquisite bronze technique of Nepal is of late Gupta origin, though enriched by the Bengali-Buddhist (Pala) imagery. In the western Himalaya the style was mixed with Gandharan and Central Asian elements (Lakhamandal, Brahmor, Chatrarhi, the Guṃ Sūrya, Sandhyā-Devī temple at Jagatsukh, Fatehpur bronze Buddha). In Kashmir the art of the Kārkoṭa dynasty occurred; first it was late Gandharan (as at Bijbehara), then under the great conqueror Lalitāditya Muktāpīḍa it absorbed the last Gupta style of Kanauj and Bihar and, with an admixture of late Roman and Chinese elements, it evolved into the medieval Kashmir style (PLS. 360, 361; Martand, Wangath, Narastan, Buniar, etc.). The earliest Gujar art occurred in Rajasthan and Gujarat (Bhinmal, Roda, Vasantgarh, Osia, etc.), with occasional Mongoloid strains. In Saurashtra Valabhi art (resuming the late Kshatrapa typology) evolved under the Maitraka emperors, represented by the tem-

ples in Gop, Than, Kadvar, Kalasara, Sutrapada, Visavada, and Bileshwar. In Madhya Pradesh the local styles of the Somavaṃśa kings (Sirpur) and of the Paṇḍuvaṃśa kings of Mahakosala (Rāmcandra temple at Rajim) developed. Finally, the classic styles of the south, of the Chalukyas (Aihole, Badami, etc.), the Pallavas (Mamallapuram), and the Gangas (Talkad), evolved. Outside India Gupta influence made itself felt in Afghanistan, the Tarim Basin (Ming-oi, Kizil), China (Tun-huang, T'ien-lung-shan, etc.), Ceylon (Isurumuniya and royal palaces at Anuradhapura, Sigiriya), Burma (Prome and Thaton), Siam (Dvaravati, Srideb), southern Cambodia, Annam (Champa), Java (Dieng and earliest Buddhist temples), Malaya, and Borneo.

Everywhere the Gupta prototypes were taken over; at first they were slavishly copied, but they soon developed in another spirit or were misunderstood. By the middle of the 8th century the Gupta tradition had disappeared, superseded by the art of the Hindu Middle Ages. However, the latter was merely an elaboration — in the medieval authoritarian spirit — of what the Vākāṭakas and Guptas had created, ideologically as a revival of ancient Brahmanical traditions, but in reality a novel, most original, and highly refined art.

**HAITI.** See AFRO-AMERICAN ART; ANTILLES.

**HALS, FRANS.** No document establishes the place or date of his birth, but there is good reason to believe that Hals was born in Antwerp between 1581 and 1585 and that his parents were Franchoys Hals, clothworker from Mechelen (Malines), and Adriaentgen van Geertenryck of Antwerp (J. van Roey, 1957). He was buried at Haarlem, Sept. 1, 1666. Frans's brother Joost, who was a painter (d. before Oct. 16, 1626), was probably also born in Antwerp; none of Joost's works have been identified. Hals's parents are not mentioned in the Antwerp census lists after 1585; it is likely that they were among the thousands of Flemings who immigrated to the Netherlands after Antwerp fell to the Spanish in 1585. The family settled in Haarlem, where Hals spent the rest of his long life. The earliest reference to Hals's parents in Haarlem is on Mar. 19, 1591, date of the baptism of Dirck Hals, the third son of the family to become a painter. According to the anonymous author of the biography of Karel van Mander published in the second edition of *Het Schilder-Boeck* (1618), Van Mander was Hals's teacher, probably only until 1603, when Van Mander left Haarlem to work on *Het Schilder-Boeck*. In 1610 Hals joined the Haarlem Guild of St. Luke.

It is not known when he married Annetje Harmansdr., his first wife. Their son Harmen (d. 1669), who became a painter, was baptized in Haarlem, Sept. 2, 1611. The record of this event gives the father as "Frans Hals van Antwerp." This appellation is found six times in the Haarlem archives, and in 1628 Hals himself signed his name that way; this is additional reason to call Antwerp his birthplace. Annetje died in June, 1615, leaving two children. The lengthy list of petty claims made against Hals by his creditors begins in 1616. During the same year (ca. Aug.–Nov.) he went to Antwerp; as far as we know this is the only time Hals left Holland during his lifetime. In Feb., 1617, Frans married Lysbeth Reyniers, who was still alive in 1675. Estimates of the number of children of the second marriage vary. Birth dates of eight are known, and at least three became painters: Frans II (1618–69); Reynier (1627–72); and Nicolaes (Claes; 1628–86). Another son, Jan (Johannes; active ca. 1635–50), whose pictures can be deceptively close to his father's (*Portrait of a Man*, 1648, Kiaer Coll., Fredrikstad, Norway), was probably a child of the second marriage. A daughter, Adriaentgen, married Pieter Roestraten, the Haarlem genre and still-life painter. Besides his five sons,

Hals's pupils included his brother Dirck, Judith Leyster and her husband Jan Miense Molenaer, Adriaen van Ostade (q.v.), and Philips Wouwerman, and he had one pupil of genius: Adriaen Brouwer (q.v.).

Little is known about Hals's character. Only two self-portraits can be ascribed to him (how different from Rembrandt, who left a series of almost 100!). One is in the group portrait, *Officers of the Guild of Archers of St. George* (1639, Haarlem, Frans-Hals-Mus.); the other, of ca. 1650, exists in numerous versions, the best at the Clowes Foundation, Indianapolis. Neither shows the physiognomy of a man who was a combination of Falstaff and Cyrano, as 19th-century romantic critics liked to consider Hals. Hals did not leave a single drawing which could give us an idea of his private thoughts or his impression of the milieu in which he lived, and not a line written by him has been found. Some have tried to attribute to him the way of life of the merry drinkers he painted (PL. 143), but this is pure speculation. The earliest reference to Hals's conduct is a phrase written by the German painter Matthias Scheits in his copy of *Het Schilder-Boeck*; Scheits noted that in his youth Hals was "a great lover of life." Scheits probably heard this from his teacher, Philips Wouwerman, who was Hals's pupil. In 1718 Houbraken wrote that Hals was usually drunk every evening, and by the end of the 19th century his biographers accused him of being a wife beater as well as a chronic alcoholic. It is true that a Frans Hals was summoned before the burgomasters of Haarlem on Feb. 20, 1616, for drunkenness and beating his wife, but Bredius (1921) showed that the authorities admonished Frans Cornelisz. Hals, a weaver, not Frans Hals the painter; moreover, Hals was a widower in 1616 and did not have a wife to beat. Hals seems to have been a respected member of his community: in 1618–19 he was a member of the Haarlem society of rhetoricians, and he belonged to the Haarlem St. George militia company; in 1629 he cleaned and "changed" paintings from the monastery of the Brethren of St. John (possibly working on pictures by Geertgen tot Sint Jans); in 1644 he was made an officer of the Guild of St. Luke; and, most important, from the beginning to the end of his career he received commissions for portraits of distinguished Dutch theologians, professors, civic leaders, artists, and merchants.

Between 1616 and 1664 he painted six group portraits of militia companies and three of regents; no other leading Dutch painter made so many. Eight of the group portraits are at Haarlem in the Frans Halsmuseum. The ninth one, *The Company of Captain Reynier Reael*, is in the Rijksmuseum, Amsterdam. Hals was called to Amsterdam in 1633 to make it; the honor was a singular one and the honorarium was high. He was chosen above the fashionable Thomas de Keyser and young Rembrandt, who had established his reputation as a leading portraitist a year earlier with the *Anatomy Lesson of Dr. Tulp*. Hals was to receive 66 guilders for each figure portrayed. (When Rembrandt was at the height of his fame he received about 100 guilders from each patron he represented in the *Night Watch*.) Hals failed to finish this picture, and it was finally completed by Pieter Codde (Bredius, 1913).

Hals had financial difficulties all his life. Even during the 1630s, when he enjoyed his greatest popularity, he was sued by his landlord, his butcher, and his shoemaker; in 1635 he failed to pay 4 stuivers to the Guild of St. Luke. By the 1640s he was receiving fewer commissions; this was the time when a considerable part of the Dutch public began to acquire a taste for the work of portraitists like Bartholomeus van der Helst, who could give his sitters a Van Dyckian air, and Hals did not follow the new mode. However, there were still those who preferred his subtle understatement to the ostentatious display of manners and clothes which was the specialty of the more popular portraitists, and he continued to receive important commissions. During the 1640s he painted four members of the Coymans family, one of the leading families of Haarlem; in 1643 Paulus Verschuur, the director of the largest textile mill in Rotterdam, posed for him (New York, Met. Mus.); and ca. 1649 he painted his most famous sitter, Descartes.

A list of the extant portraits Hals made during each decade of his career is instructive: in the 1620s, about 25 single portraits, 2 militia group portraits, 1 life-size family group, and 1 life-size double portrait; in the 1630s, about 65 single portraits and 3 militia group portraits; in the 1640s, over 40 single portraits, 1 regent group portrait, and 2 life-size family portraits. Between 1650 and 1666 he painted approximately 40 single portraits and two group portraits of regents. Hals's loss of popularity during his last years should not be exaggerated. After all, fewer commissioned portraits by the young Hals are known than by Hals the septuagenarian and octogenarian; only about ten single portraits and one militia group portrait can be dated between 1610 and 1619. The total number of extant portraits made in the course of more than a half century is about 195. Making all allowances for lost and unidentified pictures and for the vagaries of taste, the inescapable conclusion is that one of the most facile artists who ever lived was simply not very productive even when he was at the peak of his fame. Rembrandt, whose life was about twenty years shorter, made more than twice as many portraits as Hals.

The last decades brought additional difficulties. In 1642 his imbecile son Pieter was placed in solitary confinement because he was dangerous, and in the same year Hals and his wife asked the civic authorities to send their daughter Sara to the workhouse to help improve her lax morals. In the 1650s Hals's financial situation worsened — his meager possessions and five pictures were seized in 1654 by a baker in payment for an unpaid debt — and during the last years of his life he was apparently destitute. The guild exempted him from the payment of dues in 1661 because of his old age; in 1662 the burgomasters of Haarlem awarded him a yearly stipend of 150 guilders; and two years later he was given three wagonloads of peat and a 50-guilder increase in his subsidy. But for at least a short time before his death Hals was suddenly affluent: in 1665 he was able to act as guarantor for his son-in-law for the large sum of 458 guilders, 11 stuivers, possibly because of money received for his *Regents of the Old Men's Almshouse* and *Regentesses of the Old Men's Almshouse* (both 1664, Haarlem, Frans-Hals-Mus.). He died in 1666 and was buried at the Cathedral of St. Bavo, Haarlem, on Sept. 1 of that year.

An acceptable canon of Hals's work has not been published. C. Hofstede de Groot (1910), W. von Bode and M. J. Binder (1914), and W. R. Valentiner and K. Voll (1923) all endorsed about 300 paintings as authentic. Their lists include some school pieces and copies. The entry of "verschijden copijen naar Hals" in an inventory made of paintings owned by Heyndrik Willemsz. den Abt in 1631 (Haarlem Municipal Archive, St. Lucas Guild 196) is a cautionary reminder that Hals's pictures must have been copied almost as soon as they were made. However, the reduction of Hals's *œuvre* to 109 pictures by Trivas (1941) is far too radical. Recent study indicates that about 240 of Hals's pictures are extant. As we have seen, about 195 of these are portraits; except for a *St. Luke* and a *St. John* rediscovered in the U.S.S.R. in 1959 (I. Linnik, 1959), the rest are genre pictures. Seventeenth- and 18th-century inventories and catalogues cite a few additional religious pictures (Hofstede de Groot, 1–8), a *Vanitas* and *Five Senses* (Hofstede de Groot, 9 and 10), the tondos *Boy Drinking* and *Boy with a Flute* (formerly Schwerin, Staat. Mus., perhaps part of a series of the *Five Senses*), and a *Landscape* (Hofstede de Groot, 447). Hals's portraits range in size from a life-size group of 19 militiamen (1639) to exquisite tiny portraits made as models for engravers; most of them, however, are single half-length or three-quarter-length life-size pieces. Only one is a full-length life-size portrait (*Willem van Heythuysen*, ca. 1625, Vaduz, Liechtenstein Coll.). Hals's whole development can be seen at Haarlem, but he is well represented in most of the principal museums of the world. The United States is particularly rich in his works, with almost one-third of his *œuvre*. Not a single print by Hals is known. What is even more extraordinary is that generations of connoisseurs have not been able to turn up a single preliminary drawing for a painting. The drawing *Portrait of a Man* (London, Br. Mus.), called by Van Regteren-Altena (1929) a preparatory study for a portrait in The Hermitage (Leningrad), appears to be a copy of the painting. The handful of other drawings that have been ascribed to Hals are also un-

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

convincing. It seems inconceivable that Hals never made preparatory studies. Probably some of his small painted portraits should be classified as preliminary sketches, though these small studies are also rare. The meager evidence indicates that most of the time Hals must have attacked his canvas directly.

There are other riddles. What Hals did before he was 25 or 30 years old (the age depends upon the birth year one accepts) remains a complete mystery. Perhaps these were *Wanderjahre*; or perhaps, like some other artists who lived a long time, he was a slow starter. The *Portrait of Jacobus Zaffius* (1611, Haarlem, Frans-Hals-Mus.) is his earliest extant dated picture, and his development, from this work up to the end of his long life, can be traced with the aid of dated portraits. On the basis of stylistic evidence a few pictures can be placed a year or two earlier than 1611: e.g., *Man Holding a Skull* (Birmingham, Eng., Barber Inst. of Fine Arts) and *Portrait of a Woman* (Derbyshire, Eng., Chatsworth Settlement). Their sober character and stiff poses show Hals's debt to painters like Cornelis Ketel; but what is more important, they already show evidence of the fluent brushwork which is Hals's hallmark. If the *Banquet in a Park* (ca. 1610; formerly Kaiser-Friedrich Mus., destroyed in World War II) was painted by Hals — and it is difficult to think of another artist who could have painted the picture — it indicates that at the beginning of his career Hals painted genre scenes of "gallant companies" that evolved from the Prodigal Son and Banquet of the Gods pictures of David Vinckeboons and the Haarlem mannerists, Van Mander, Hendrik Goltzius (q.v.), and Cornelis Cornelisz. van Haarlem. A few years later a new generation of painters working in Haarlem (W. Buytewech, E. van de Velde, and Dirck Hals) developed the "gallant company" picture into a special branch of painting; but Hals's métier was portrait painting, and as far as we know, during the rest of his long career he never again painted a genre picture lacking a portrait-like character.

His *Banquet of the Officers of the Guild of Archers of St. George* (1616, Haarlem; PL. 144) is the first monumental landmark of the golden age of Dutch painting. The entire work exults in the healthy optimism and strength of the men who had helped establish the new Dutch republic. There is no precedent in the long history of Dutch group portrait painting (cf. A. Riegl, 1931) for the impression of immediacy he achieved or his forceful characterization of all 12 sitters. Even the still life on the damask tablecloth is a spectacular measure of Hals's new vision, and it makes those painted by the contemporary Haarlem still-life painters, Floris van Dyck and Floris van Schooten, appear dry and naïve. However, the picture's ties with the past should not be overlooked. The composition is an elongated version of Cornelis Cornelisz. van Haarlem's *Banquet of the Officers of the Guild of Archers of St. George* (1599, Haarlem); the change gave Hals's patrons elbowroom — something the sitters for Dutch group portraitists had never before enjoyed. Like his predecessors, Hals was able to introduce only a slight suggestion of air and atmosphere around the heavy black figures. A convincing diffuse light entered Hals's pictures only in the 1620s, the decade when he made an even more decisive break with the mannerist tradition of late-16th-century Dutch painting. Hals's predilection during the 1620s for plein-air effects and a light tonality shows that he was impressed by innovations that Caravaggio's Dutch followers H. Terbrugghen and G. Honthorst (qq.v.) brought back from Italy. His debt to the Utrecht Caravaggists is most evident in his half-length life-size genre pictures (PL. 146) of musicians, drinkers, actors, and laughing children. But there are also significant differences: he was not at all interested in their experiments with the dramatic chiaroscuro produced by artificial light; the expressions of his subjects never freeze into grimaces, and the subjects never look like costumed models posed in a studio. The vitality and spontaneity which characterize Hals's portraits were perfected in his genre pictures. It is clear that almost all Hals's extant genre pictures were made during the first half of his career, but it is difficult to establish a precise chronology for them because only one is authentically dated: the *Fruit Seller* of 1630 (Bridgnorth, Eng., Viscount Boyne Coll.; the still life in it was painted by Claes van Heussen, and he dated the picture). The date of 1623 on the so-called *Yonker Ramp and His Sweetheart* (New York, Met. Mus.) does not appear to have been inscribed by Hals himself, but on the basis of stylistic evidence that date is acceptable. Moreover, it is hard to correlate the genre pictures with the dated portraits because the former were always executed with much greater freedom then the latter. Hals never tried to hide his brushwork in his genre paintings; on the contrary, his unmistakable touch is discernible in all his pictures. An examination of even his commissioned portraits done in the traditional smooth manner shows that he added touches of broken color to them when they were finished in order to introduce his own style. During the last decades of his life he virtually ceased to make genre pictures. His brushwork, however, became bolder and more economical, and the slashing strokes that were once reserved for paintings of fisherboys and screeching women were used for commissioned portraits of respectable burghers and their wives.

Hals reached the height of his popularity during the 1630s. This period marked a shift toward a greater unity and simplicity in his style; the bright colors of the 1620s gave way to more monochromatic effects. A change in fashion helps account for the new sobriety; during these years the stately black regent costume replaced the multicolored and richly embroidered clothes of earlier decades. The dignified character of the *Regents of the Hospital of St. Elizabeth* (1641, Haarlem, Frans-Hals-Mus.) typifies the pictures Hals made in his last decades. By the middle of the 17th century Dutchmen were not so aggressive as their fathers had been. It is no accident that group portraits of militia companies were painted hardly anywhere in the Netherlands after 1650. The bravura of an earlier generation was replaced by a generation concerned with consolidating its gains. Hals's late penetrating portraits have the same restraint that characterizes the majestic works Rembrandt painted during this period. To be sure, Hals never had Rembrandt's productivity, depth, or universal range, but he did have Rembrandtesque moments; and conversely, Rembrandt had Halsian moods. This is overlooked in the comparison made so frequently between the young Frans and the mature Rembrandt. After 1640, portraits of sitters wrapped in sober introspection became more frequent than smiling ones. The classic frontal pose he gave his patrons helps account for the new dignity; deep olive greens and silver grays replaced the warm yellow ochers of the 1630s; his pictures became darker, and even the flicker of light on black costumes was reduced, until finally, as in Hals's masterpieces of the *Regents of the Old Men's Almshouse* and *Regentesses of the Old Men's Almshouse*, we are conscious only of white linen, hands, faces, and — one is tempted to add — souls.

Hals never lost his delight in the viscosity of oil paint, and he kept until the very end of his life his unsurpassed surety of touch, which could simultaneously draw, model form, define texture, and create lively spatial and surface accents. None of his pupils grasped the revolutionary aspects of his *alla prima* technique, and his contemporaries were blind to it — or, at any rate, they were mute about it. Neither Huygens nor Vondel mentioned Hals in their writings; Sandrart, who knew the Dutch art scene well, did not think him worth even a thumbnail biography. A century later Reynolds acknowledged that not a single painter had Hals's ability to capture the character of a sitter, but he thought it unfortunate that Hals did not have the patience to finish his pictures. Hals was a discovery of the 19th century. Courbet and the impressionists saw the qualities of his tonal painting and brushwork, and they were the first to dare rank with the greatest Western artists the man who had been dismissed by earlier critics as a mere "face painter."

**HANDICRAFTS.** The word "handicrafts" refers to useful or decorative objects made by hand or with tools by a workman who has direct control over the product during all stages of production. The term also indicates the methods of production. Its meaning is close to the significance of "minor arts." Because of the tendency in much of the history of handicrafts to repeat and imitate models and prototypes, modern critical terminology has also used the expression for a qualitative evaluation of certain examples of painting, sculpture, and architecture; in this use the term indicates that these products have not succeeded in reaching the highest levels of art but are rather documents of the average output of a period.

The diversity of handicraft techniques, materials, trading practices, and producing organizations in the various civilizations makes certain general statements difficult. Aspects of specific handicrafts may be studied more closely in the following articles: AUTOMATA; CERAMICS; COINS AND MEDALS; ENAMELS; FEATHERWORK; FURNITURE; GLASS; GOLD- AND SILVERWORK; INLAY; LACQUER; METALWORK; MOSAICS; MUSICAL INSTRUMENTS; PUPPETS AND MARIONETTES; STAINED GLASS; STUCCO; TAPESTRY AND CARPETS; TEXTILES, EMBROIDERY, AND LACE.

SUMMARY. General considerations (col. 269). Antiquity (col. 271). Western Europe (col. 273). Non-European civilizations (col. 278): *India; China; Islamic civilization.*

GENERAL CONSIDERATIONS. While handicrafts include many activities which normally do not form a subject of esthetic evaluation and which serve to satisfy exclusively practical needs (e.g., the work of tailors, shoemakers, blacksmiths, masons), almost every kind of handicraft has furnished high-quality products that may be considered true works of art. Handicraft products vary markedly in materials, techniques, and the skill with which they are executed. Economic factors that may affect the production of handicrafts include demand and the means of the consumers.

The distinction between handicrafts and industry is based not only on differences in techniques but also on economic ends and methods of organizing labor. The term "industry" generally applies to production involving large quantities, limited concern with quality, and collective rather than individual output. However, since the industrial revolution and the changes in construction techniques through science, the quality level of industrial production has risen considerably. While art in contrast to industry — until modern times, at least — could be considered as production designed to yield the highest possible quality with a sacrifice of quantity, in handicrafts as opposed to both art and industry the relative values of quantity and quality are different in many ways. The general law that quality is inversely proportional to quantity has some validity for handicrafts as well as for art, however — the goal of handicrafts being the unique, as opposed to the mass-produced. A theoretical distinction between art and handicrafts (which has led to a social distinction between artist and artisan) has been made only since the Renaissance. (However, there was some awareness of the possibility of a theoretical distinction as early as the great ancient civilizations.) Various changes in the Western European world indicate that these theoretical distinctions were not fully made until after the period of maximum prestige and diffusion of handicrafts.

Between the 11th and 14th centuries, handicrafts were principal components of the structure of European society: They were a chief source of the cultural development of the cities, thereby furnishing the basis of municipal autonomy; they gave rise to active trade in merchandise and thus to a vast network of cultural relations; and they promoted indirectly the creation of great masterpieces of architecture, painting, and sculpture. If such masterpieces are compared to other products of the same technical level which answered particular and immediately practical requirements, the need for a clear distinction between the spiritual and the utilitarian becomes apparent. Dante, Petrarch, and Boccaccio were aware that Giotto and Simone Martini were not merely superior artisans and that the forms of their art were outstanding more for human content than for refinement of execution. In the 15th and 16th centuries the distinction was given a deeper theoretical basis. But the separation of handicrafts from the fine arts was not only a matter of the history of thought; it was also connected with changes in political, economic, and social systems and with the evolution of science and technology. This separation was a long and involved process and one which is not yet completed (see below, *Western Europe*).

Handicrafts, or at least their highest expression, were for a long time subject to the directives of the courts and the great centers of religious culture. Only in the late Middle Ages, with the affirmation of the liberties of the cities, did handicrafts acquire independence and constitute the basis of a bourgeois class able to exercise concrete political influence. However, when the signories brought into existence a new kind of political power, the princes sought interpreters of an elite culture in the individual personalities of artists, rather than in the collective personalities of artisans. The growing stratification of classes by social function and economic means led not only to a prolongation of the economic role of handicrafts but also to the formation of many new branches of handicraft activity, which became more and more specialized. Finally, several kinds of activity were required to produce a single object.

The fate of handicrafts seems to have been linked with the autonomy and self-sufficiency of the cities, that is, with the clear division between town and country. Handicrafts add to the value of material the value of human labor and make possible the accumulation of wealth by the city dweller; the country dweller can accomplish this by the ownership of productive land. If the finished handicrafted piece is to constitute a transmissible heritage, its value must not depreciate with the passage of time, and it must be durable; production as a whole must tend to retard changes in taste. Such necessities strongly influence the organization and technical development of handicrafts. The value of an object is in part correlated with patient, detailed work — with the complexity and difficulty of production. In contrast to industry, which always tends to simplify forms, handicrafts tend to complicate them, sometimes even whimsically, or to attain extreme refinement in the choice and preparation of materials.

In the history of handicrafts, the need to protect against competition has led artisans to use secret processes and to emulate the products of others. In certain tribal societies specialized craft groups are under the protection of magico-religious regulations which preserve artistic secrets and transmit them to the initiate. In urban societies, in the course of generations, the activities of an individual workshop frequently gave impetus

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

to the formation of other workshops linked to the first by family ties. A given city might become specialized in a particular type of production, and protection of a shop's business would become part of the larger process of fostering the production of a whole city or even a whole state; thus there arose legally constituted professional associations of various categories of artisans, which protected the general conditions of the market, set up rules of competition within the different categories, and favored the exchange of experience as well as improvement in the quality of production. This general trend explains how the techniques of handicrafts multiplied through the accumulation of work experience, without use of the discoveries of science; it must be kept in mind, however, that in the centuries when handicrafts truly flourished, science, which was then merely systematic and speculative, did not readily lend itself to practical application. When science assumed an experimental character, handicrafts were undergoing a crisis. At that time artists were seeking contact with science in order to analyze nature rather than to serve utilitarian ends. The limit of handicraft techniques can clearly be observed during the scission of artistic activity in the Renaissance and baroque periods, when supreme efforts were made to raise quality handicrafts to the level of art; these strivings succeeded only in substituting the ideal of elegance for ideals of the beautiful, of ingenuity for talent, and of the arbitrary and capricious for creative originality. It was then that handicrafts broke their own traditions and accepted cautiously some discoveries of science and mechanics, always bringing them into line with the accustomed procedures of the shop. Handicrafts branched out into ever-greater technical specialization and were transformed into luxury art to serve the demands of the richest and most conservative classes of society. There soon arose new methods of organizing handicraft work, and concentration of the means of production resulted; at the same time the first manufacturing establishments were begun. The replacement of handicrafts by industry, even in high-quality production, has been accelerated, but handicrafts still survive. Their cleavage from higher artistic activities had serious repercussions both on the average quality of the handicraft product and on the development of architecture and representational art (see AMERICAS: ART SINCE COLUMBUS; EUROPEAN MODERN MOVEMENTS). In the 19th century John Ruskin and William Morris (qq.v.) made pleas for a revival of quality handicrafts and even of medieval guilds of artisans. The supporters of a real introduction of handicrafts into the framework of industrial production have based their arguments on the need for the experience of the artisan (see INDUSTRIAL DESIGN).

Handicraft products are now considered valuable material for the reconstruction of the esthetic history of civilization; their historical cycle has been almost completed. From the evaluation of individual objects historians have gradually passed to general evaluations, recognizing the creative nature of the production. The output of primitive cultures and that of a spontaneous and popular character have been reevaluated on the basis of esthetic considerations.

In addition to the great branches of handicrafts, related forms of activity which do not have commercial exchange as an end in itself often are artistically interesting. In this sphere are included buildings of certain types (see ARCHITECTURE); utensils, tools, and furnishings used by farmers and fishermen in their work and at home; domestic handicrafts (lace, embroidery, etc.); and some forms of folk art (q.v.). Rural handicrafts, which may be either related to or independent of urban handicrafts, are disappearing with the elimination of certain traditional distinctions between town and country and with the spread of industrial products in areas far from centers of production.

ANTIQUITY. Within the first agricultural societies, handicrafts probably constituted a specialization of agriculture and related activities; from these early societies we must exclude, however, those of the first prehistoric period (see PREHISTORY), in which the relation between handicrafts and art cannot be expressed in the critical terms appropriate to later cultures. (The connection of handicrafts to agricultural activities is suggested by the Semitic root *hrs*, "to plow," from which the word for artisan is derived in many Semitic languages.) In all primitive societies the origin of handicrafts has been considered an act of divine revelation; this has helped give the community of artisans an esoteric character, accentuated by rules safeguarding professional secrets. With the development of urban life, the various handicraft specialties became concentrated in their own quarters of the city. (This was true of the different regions of the ancient, medieval, and modern worlds.) When the first urban agglomerations arose in Mesopotamia around great temples, artisans were added to the staff of the temple and produced the articles necessary for worship and occasionally even participated in religious ceremonies. Later, when secularization of the state took economic monopoly away from the great sanctuaries, the artisans acquired a certain independence and could sell their products on the market or work on order, generally for the royal household. (Slaves worked side by side with the artisans.) Comparable phenomena may be observed in the different civilizations of the ancient Near East.

* *

In ancient Greece and Rome artisans were men engaged in manual activities, including occupations considered fine arts. The famous passage in Xenophon (*Memorabilia*, III, 10) that presents Socrates' theories on absolute beauty mentions, without establishing any hierarchy of merit, the painter Parrhasios, the sculptor Kleiton, the corselet maker Pistias, and an anonymous painter of hetaerae. Artisans were considered indispensable for everyday life but, nevertheless, enjoyed very little esteem. The *technitai* and the *artifices* (craftsmen), whether citizens, metics, or slaves, were always regarded as inferior to philosophers, politicians, and warriors. Not only did Aristotle exclude craftsmen from citizenship (*Politics*, 3, 3, 2: "The best form of state will never admit the artisan to citizenship because the artisan class works with its hands for the community in the same way in which a slave works for his master"), but even authors who appreciated the educational and political worth of the arts, such as Plutarch (*Pericles*, 2) and Lucian (*Somnium*, 9), disparaged the artist as one who lived by the work of his own hands. In Sparta and the aristocratic communities citizenship was denied to artisans, and only metics and slaves might pursue the arts. However, in the more democratic societies such as Athens, all citizens, metics, and slaves could practice the various trades; furthermore, the evaluation of the products of arts and handicrafts was not influenced negatively by the low social prestige of their producers. When the Greeks praised the *banausos* (craftsman) who created a work of higher art, they magnified his work, which would remain an eternal document of a superior craft, but at the same time they separated it from the human personality of the author, who always remained merely a *banausos*. In Rome this attitude of approbation was lacking, a fact which Cicero (*Tusculanae disputationes*, 1, 4) lamented: "If Fabius was praised because he painted, might perhaps we not have also had at Rome artists to place alongside Parrhasios and Polykleitos? *Honos alit artes* [honor nourishes the arts]." In Rome that *honos* was absent — the honor or praise which alone could stimulate the artisan to become an artist. Gradually the lowly status of artisans in both Greece and Rome caused them to unite to protect their livelihood and defend their interests — in *koina* in Greece and in *collegia* or *universitates* in Rome. These associations were powerful and well organized in the Hellenistic period. At least as early as Diocletian, the communities of artisans were under tight control of the central power; provision was made for artisans' associations in the legislation of Theodosius. There were, however, more slaves than free artisans under the Roman Empire.

Every ancient locality boasted some outstanding handicraft of its own. Thus Athens and Corinth had no rivals in vases and bronzes; Babylonia, Tralles, and Phoenicia were famous for leather goods; Egypt, Phoenicia, and — under the Roman Empire — the valley of the Rhine excelled in glass; Samos, Aegina, and Etruria were outstanding for jewelry. Even minor inhabited centers had their own characteristic products; in Etruria, for example, tomb paintings were important at Tarquinia, tripods at Vulci, alabaster reliefs at Volterrae, and cano-

pic urns at Clusium (Chiusi). These specialties often survived even after the Empire had been destroyed.

Silvio Ferri

Western Europe. The handicrafts of the very early Middle Ages were based on Roman handicrafts. Producing generally mediocre work, the craftsmen followed changes in taste determined by the creative activities of greater artists. The same motifs were used again and again, as in the many mosaic floors done in both East and West. Ivory carving and the casting of silver and bronze objects were entrusted not to individual artisans but to associations or groups of freemen or serfs. Each seignorial community, with its artisans, could boast of a kind of productive self-sufficiency.

The burdensome taxes of the Byzantine Empire made it difficult to obtain raw materials; because of the need for considerable initial capital, there arose workshops of artisans, especially in the East. Numerous shops grouped together in their own quarters according to their specialties: the glass blowers near the Gate of Glass on the Golden Horn, the bronze smelters in the Chalcographia between Hagia Sophia and the forum, the gold and silver smelters in the Mesé (the main east–west street of Byzantine Constantinople), and goldsmiths and weavers near the imperial palace. Except for the state silk workshops, the enterprises were privately owned, and the masters were united in associations. Apprenticeship lasted two years, the master often paid by the apprentice's family for his teaching. Prices were fixed by law, and large fines were imposed for increasing or decreasing them. Artisans attached to the service of the palace and the monasteries produced religious objects.

In the West, the economic reforms of Diocletian and Constantine, which bound freemen to their place of habitation or indirectly prevented their passage from one trade to another, led to the growth of hereditary trades; this growth was further favored by the barbarian invasions lasting from the 5th to the 9th century. Barbarian jewelry, both ornamental and religious, was distinguished from local works of art because of its homogeneity of ornamental motifs. The surviving examples come mostly from tombs. Barbarian jewelry was probably spread by the tribes themselves, or perhaps, as is indicated in a text in Lyons (*CIL*, XIII, 1945), by colonies of Eastern merchants in the West.

The closed economic system of the Middle Ages led, in the West, to a development of local handicrafts; all the needs of the local feudal nucleus were met by a group of artisans through their various specialties. The great monasteries, which were also organized during this same period in self-sufficient communities, similarly had their own artisans, who were originally converts or monks. Because of increased demand, monastic artisans later came to include serfs and freemen. Within this economic system, in which trade was quite limited, there arose traveling artisan organizations such as that of the *maestri comacini*, which was composed of masons furnished with building tools and able to build structures on traditional models. These masons were accompanied by stonecutters, who had the job of sculpturing capitals and making presbyterial furniture. However, those handicrafts which required more precious raw materials always remained attached to the abbeys and the courts.

In the Romanesque and Gothic periods, changes in social and political conditions led to overproduction within the closed economies. Meanwhile the lay artisans were detaching themselves from the great monasteries. With the movement toward urban centers the growth of handicraft associations was stimulated; indeed, these had never completely disappeared. Ordinances and statutes regulated apprenticeship, prices, and wages, supervising the special interests of the different occupations and preventing free competition as well as providing material and spiritual assistance to their members. As a rule, an individual had to belong to an association in order to practice its trade. However, an artisan freely entered and left a workshop, and, if he wanted, he could move with his work companions to another location when a job was completed. Within the workshop the activity of the artisan was subject to the artistic direction of a master builder — generally an architect — who gave orders, divided and supervised the work, and left much of the actual execution to individual initiative; the entire administrative and financial responsibility belonged to an agent or overseer. Sometimes individual artisans or entire workshops were transferred from one organization to another; thus styles were spread over great distances in the Middle Ages. The demands of the great public works and the trade in manufactured articles, first with nearby centers and later with more distant ones, led the artisan to keep improving the quality of his products; there was some specialization and division of labor. Medieval documents of cathedral workshops offer a clear picture of the use of specialized craftsmen such as masons, carpenters, stonecutters, glass blowers, mosaicists, tinsmiths, cabinetmakers, and bronze smelters. As a rule, the more eminent artisans worked in their own shops. Information on professional handicraft associations is furnished by statutes preserved in considerable number, of interest for their information on the internal organization, privileges, and spiritual obligations of members. Worthy of note is the record in the *Livre des métiers de Paris* that Estienne Boileau, provost of the merchants of Paris from 1258 to 1268, placed goldsmiths in the first rank of the six bodies of masters in Paris; goldsmiths' work he felt, was the most noble because it served the king.

Handicraft production in the Middle Ages everywhere reached the level of great art; there even existed a superiority, lasting until the Renaissance, of the so-called "minor" arts over the "fine" arts. The beauty and costliness of the objects produced by craftsmen contrast with the humble anonymity of their makers. Centers of production changed according to the period and the specific art, although often located close to import routes or sources of raw materials. In the Early Christian period, for example, weaving shops were numerous in Syria, the terminal area of the silk caravan route from China. Many shops for ivory carving were found at Antioch and Alexandria, near the centers of ivory production. Egyptian bronze-lamp works were not far from the copper mines of Cyprus. However, such strategic location was not always necessary; imported raw materials could be transported without too much difficulty. Early Christian ivory-carving shops existed in Milan, Rome, and southern Gaul; weaving shops were found in Egypt. Byzantine handicrafts had their seat in the capital city, and only much later did there develop a limited monastic production; this was true even of the great monasteries of Byzantium itself — for instance, the Monastery of the Studion or those of Mount Athos. Jewelry of a barbarian type appears to have been widespread, but its centers of greatest production were the courts of kings and dukes — in Italy, for example, at Pavia, Cividale, and Spoleto. In the Carolingian period, the largest centers for both jewelry and ivory carving were monastic communities; in these the cultural activity of the time was concentrated. Other large centers included Tours, Metz, Lorsch, Reims, and, for a short time, Rome and Milan. Later, centers of production proliferated; they can best be studied according to the raw materials and techniques they used.

Handicraft products, especially those of small size, could be transported readily, and traffic in such items helped to diffuse stylistic tastes rapidly and to open new markets. Thus ivories and tin ampullas and devotional objects made in the East spread the themes of Syro-Palestinian iconography in the West during the Early Christian period. The great silk caravan route served to introduce into European markets not only Chinese but also Sassanian handicrafts, particularly fabrics, metalwork, and pottery. Byzantium — through its conquests, direct contact with subject peoples (including the Slavs), and official relations with the Carolingians and the Ottonians — spread its handicrafts widely by land and sea. However, the really broad diffusion of Byzantine handicrafts in the West came after the sack of Constantinople in 1204. Islamic handicrafts, such as glass, metalwork, pottery, ivory, and cloth, were the objects of trade soon established between the two opposite shores of the Mediterranean. Earlier, rapid commerce in small handicrafts had been kept alive along the routes used by pilgrims to reach the Holy Land or such European shrines as Santiago de Compostela. Soon after A.D. 1000, handicrafts of small size and modest

cost were being transported along several routes: the great Frankish route which reached Rimini through the Saint Bernard and Mont Cenis passes and which continued down the Adriatic shore; along the route from Rimini to Rome; and along the four roads from the east of France to the Pyrenees. Workshops were established at Limoges, located on one of the direct routes to Spain; from that country, at least in the early period, there were imported vitreous pastes for the manufacture of enamels.

Guglielmo MATTHIAE

As has been noted, with the rise of cities handicrafts were no longer exclusively in the service of court and clergy. Workshops produced also for a new secular society of merchants and bankers, while the guilds, whose role remained essentially an organizing and protective one, participated more and more in the artistic and political life of the city. But the workshop, which in its group undertakings may have been an excellent form of artisan organization, contained the seeds of disintegration in the first affirmation of individualistic aspirations; eventually the artist was to be separated from the artisan in a crisis of the traditional organization of production. The division between artists and craftsmen did not take place, however, until the beginning of the 16th century; throughout the 15th century the artist (painter or sculptor) still kept to the way of life and method of work of the artisan. In many shops, even in those of the most famous masters, orders were accepted for works on the borderline between handicrafts and art, as for the decoration of furniture. A new esthetic consciousness was favored by the development of Humanistic theory and by the formation of the signories; the artist put himself at the direct service of a prince and became a courtier, art expert, and free intellectual.

It is significant that while Cennino Cennini subordinated art to science and regarded his treatise on painting as a technical handbook for the artisan, Leon Battista Alberti (q.v.) defined painting as a science and took up Horace's theme of *ut pictura poesis* ("as is poetry, so is painting"). From Alberti's time until the end of the 18th century, almost all art treatises argued in behalf of the fine arts, trying to separate from crafts the arts of painting, sculpture, and architecture in order to raise these three to the status of liberal arts held by poetry and music. The clear distinction of rank, both theoretical and social, between the fine and minor arts based the fine arts on science, history, and invention and the minor arts on hand labor, practice, and imitation. Leonardo da Vinci considered painting a liberal art, but not sculpture, which was too fatiguing and mechanical. In the 17th century the English thought only the painting of miniatures and water colors fit for a gentleman because these arts did not dirty the hands. The separation of art from handicrafts was to be advanced by the 16th–17th-century transition from the idea of art as science to art as poetry. The manual and technical aspects of artistic creation, still respected in the 16th century, were later on set apart and depreciated more and more.

The emancipation of artists from the guilds led to the formation of the first art academies created on the model of the literary ones [e.g., the academies of Bertoldo di Giovanni, Leonardo da Vinci (qq.v.), and Baccio Bandinelli]. In Rome it was Michelangelo who forswore the traditional shop and the principle of collaboration associated with it, and who persuaded Paul III to exempt Roman sculptors by decree from the jurisdiction of the guilds. In addition, the Accademia dei Virtuosi was established; in 1593 the Accademia di San Luca was revived. The latter, while welcoming gilders, embroiderers, and engravers, gave hierarchic supremacy to painters, sculptors, and architects. In Florence, Vasari promoted the foundation of the Accademia del Disegno. In 1570 Florentine painters were exempted from membership in the guild of doctors and apothecaries; sculptors were similarly exempted from the builders' guild. Examples of handicraft products that are close to the fine arts are found in the work of the goldsmith Cellini (q.v.) or the miniature painter Giulio Clovio. Tommaso Garzoni (*La Piazza universale di tutte le professioni del mondo*, Venice, 1585) indicates the multiplicity of handicraft specializations (most of them very humble) and how varied and broad was their terminology.

Because of the shift of interest from ornament to the meaning of the image, the decorative arts as well as handicrafts underwent radical renovation. The ideal of monumentality and the importance given to so-called "history" painting in the principal classical formulas supplanted the medieval taste for beautiful material and abstract decoration: mosaics gave way to frescoes; bronze took the place of ivory; woodcuts replaced miniatures; enamel work declined to become a mere decorative accessory. Pottery, made in imitation of painting, included display pieces as well as useful objects. When, at Urbino, Raphaelism gave way to genre, a certain decadence became apparent. Even ivory work and tapestry declined because of their attempts to emulate sculpture and painting; the decorative arts were subordinated to the fine arts by virtue of imitating them and using their inventions or design.

From the 14th century onward, handicrafts had developed — at least in some areas — to the point where they depended heavily on capital and on the market. It is sufficient to recall that Florence about 1400 contained 84 major silk factories, which employed 15,000 workers and exported cloth to all Europe, from London to Constantinople. Florence was also in the forefront for the quality of its furniture and pottery. In 1474 the city had 84 workshops for engraving and inlay, 54 marble workshops, 44 goldsmith and silversmith workshops, and dozens of shops of painters and sculptors. Growth of international trade and capitalism, by accelerating mechanization, favored the trasformation of handicrafts into industry. Mechanization was introduced first into textile manufacture; competition existed among the textile factories of Lucca, Siena, Genoa, Milan, and Venice. (In the 16th century Venice annually exported cloth and textile worth 10 million sequins, or zecchini, and sent an amount worth $1^1/_2$ million to the rest of Italy.)

Medals were an original creation of 15th-century Italy; the development of smelting and accurate execution guaranteed artistic esteem for the products of such artists as Pisanello, Matteo de' Pasti, and Luciano Laurana. In the 16th century, use of the pendulum press hastened the decay of the art of making medals, while still permitting new esthetic possibilities in coins.

Mechanization of printing put an end to hand copying and hand illustration of books. Woodcutters, engravers, and miniature painters were employed in the decoration of pages. As early as the 15th century the first secular ateliers appeared, and they produced playing cards and sacred or profane pictures which in technique and style were perfectly adapted to the use of printed characters. Copper engraving was to serve for centuries to illustrate books and to circulate the visual arts much more widely; often copper engravings reached high levels through the work of great artists. In the 16th century, bookbinding ceased to be the work of goldsmiths. Its decoration was stamped with a roller on leather; in general, decoration became less costly, though it was not devoid of esthetic effect.

Industry made use of artists, calling upon them to design models for tapestries (e.g., Raphael's tapestries woven in Brussels), cloth, pottery, carved floors and ceilings, and furniture. This division of the plan from its execution is evidenced by the usual signature with the inscriptions *invenit* and *excudit*. The artist not only ceased to execute the work himself but also was ignorant of its techniques; therefore esthetic quality was almost always dependent on the interpretation of the executors in their stylistic translation of the plan, according to the nature of the material and the particular handicraft technique.

The great commercial importance of much production caused competition among the various European states in order to overcome foreign monopolies. The first large-scale attempt to nationalize and regulate all artistic industries took place in France, where in 1599 the king granted the Milanese Turati the means to open factories for spun gold in Paris; in 1607, the king favored the creation of royal manufactures. Later, in 1662, Colbert joined them to the Manufacture Royal des Gobelins, expanded in 1667 into the Manufacture des Meubles de la Couronne. Colbert's attempt was a grandiose one — to organize handicrafts

according to industrial principles, at the same time regulating the esthetic aspect of production through the dictatorship of the painter Charles Lebrun. The fact that designs were confided to artists such as Vouet and Lebrun explains the influence of monumental baroque on the handicrafts of the 17th century.

The French royal factories, distrusted by the old guilds, soon became the most important factories in Europe. Until that time the best handicrafts had always been destined for the courts and the aristocracy, but in the 18th century the number of customers grew larger; the *bourgeoisie* was on the rise, and the aristocracy was giving up its great palaces and living in apartments which required furniture of small dimensions and small decorative objects. The rococo was a new triumph of the taste for beautiful material, stylization, and ornament. Ivory and enamel returned to favor and were used in France, Vienna, Dresden, and London for snuffboxes, jewelry cases, and toilet objects; mirrors, crystal, porcelain, precious woods, and marbles were also prized. The most varied handicraft specialities were utilized for furniture; besides the traditional inlaid work in exotic woods, ivory, marble, stone, and bronze, Boulle work was originated in France under Louis XIV, together with lacquered and painted furniture. Wide use was also made of decorative ceramics and cameos. Thus painters, tapestry makers, carvers, and bronze workers worked together in the execution of a single object. Rococo decoration was conceived by architects and painters as a harmonious synthesis of various handicrafts — furniture, mirrors, tapestries, and stucco; painting was limited to coverings and panels — that is, to simple decorative elements of the whole. It is significant that Watteau's master, Audran, was a decorator. The influence of tapestry work and porcelain on the painting of Boucher and other rococo painters is noteworthy. Catalogues of ornament also were compiled. Until the work of Albertolli and others in the 19th century, these catalogues exercised considerable influence on taste; they were authentic handbooks of handicrafts, while also favoring that standardization which characterizes industrial production.

Although luxurious handicrafts triumphed in France, where the *bourgeoisie* was weak, in more economically progressive England, as early as the 17th and 18th centuries, products were developed which were genuinely utilitarian and inexpensive, in anticipation of modern industrial output. The weight of economic factors in determining production activity became greater than in the past. A crisis occurred in gold- and silverwork (flourishing again in 18th-century taste), which came to a head in 1722 as the result of wars and the bankruptcy of the financier John Law in 1720. This crisis brought enormous advantages to porcelain, which was less costly than silverware and soon became stylish. At the end of the 17th century, the production of fine earthenware was thriving in England and Holland, and imports from China and imitations of Chinese ware increased greatly. In 1709 the process of making hard porcelain of the Chinese type, which required kaolin, was discovered at Meissen, Saxony; this discovery led to a struggle to monopolize the raw material.

The old craft associations with their privileges had become a conservative element; though protected by the kings, they were disliked by the new bourgeois class. In an attempt at reform the king of France, with the Edict of Turgot in 1774–76, suppressed the handicraft guilds; they were subsequently reestablished, again dissolved during the French Revolution, reestablished once more, and finally abolished by Napoleon in 1806. It was inevitable that they would be sacrificed to the new economic principle of free trade. This turning point in handicrafts became apparent about the middle of the 18th century and was due in part to increasing demand (which caused a gradual decline in quality), but chiefly to the growth of industrial production. In England the modern factory, incorporating many machines and laborers, was organized by the capitalist. Everywhere technical progress favored utilitarian production of glass (especially in Belgium) and the working of iron. The new textile industry made great strides forward and even succeeded in producing carpets and tapestries by machine; in these, however, industry imitated craft models, producing debased versions for mass distribution.

Thus the split between artistic creation and productive activity became more pronounced. Artists felt estranged from both industrial production and handicrafts, which were no longer a creative force, and considered themselves the defenders of the idealism of art against utilitarian materialism; a new concept arose, that of the "artist-priest," who was not an artisan but who was disdainfully isolated from society or in conflict with it (Schiller, Schelling, Coleridge). When Prince Albert promoted a show of artistic industrial products in London in 1851, Ruskin denounced the mediocrity of Victorian products, blaming the factory and the machine, which deprived the workman of an intimate relation with material and form. William Morris even spoke in favor of a rebirth of medieval handicrafts with their guilds; he founded a center of production (painting, engraving, metalwork, furniture, etc.) which had great importance for the formation of Art Nouveau (q.v.). In the last years of the 19th century and the first years of the 20th, there occurred throughout Europe an apparent revival of handicrafts; but since this was essentially a reaction of intellectuals against industrial mechanization, the movement hastened rather than delayed the historical decline of crafts. Not only were the products of these elite crafts so expensive that they could be bought only by the wealthy classes, but industry speedily repeated in cheap materials the types created by artists; this gave rise to a uniform and almost universally diffused style. Although the reaction to industrialism did not cause a true revival of handicrafts, it did serve to point out the problem of achieving quality in industrial production. Laborde, Semper, and Muthesius maintained that machines were not necessarily incapable of producing objects of high esthetic quality; they could do so if properly used. Later developments in this field belong rather to the history of industry than to that of handicrafts, which is now perhaps almost over (see INDUSTRIAL DESIGN).

After the disappearance of the shops and handicraft guilds, other means of providing for the training of masters were needed. In France, in 1794, the Ecole Polytechnique and the Conservatoire des Arts et Métiers were established. The second half of the 19th century and the first decade of the 20th saw everywhere the establishment of professional schools to train the creators of forms as well as technical directors, art teachers, and specialized workers. After World War I, Walter Gropius (q.v.) founded the Bauhaus at Weimar, which had as its goal the preparation of a class of artist-planners for industry. A constant concern was always the safeguarding of the esthetic culture and experience historically linked to handicrafts, so that this culture and experience might not be dissipated by industrial technology or undermined by the economic goals of capitalism. The historical example of handicrafts was counted on and deliberately perpetuated, not only to improve the esthetic quality of the industrial product but also to furnish a moral lesson to industry on the obligation to strive for quality. Such an approach was significant in the German *Werkbund* (1907), similar English institutions, and the first phase of the Bauhaus. The same approach, fundamentally a moralistic one, as well as the desire to demonstrate art values as absolutes which can be reached through the most simple, traditional, and at times even archaic technical processes, have led various modern artists (e.g., Picasso and Matisse) to produce pottery, tapestries, cloth and jewelry. In Aubusson, France, a tapestry factory directed by Jean Lurçat was established for the purpose of showing that modern forms can be expressed through traditional techniques. However, in these 20th-century examples there is no question of reviving a dead system; rather, individual attempts have been made by artists aware of the need to seek in all the creative forms of mankind the history of esthetic experience.

Luigi SALERNO

NON-EUROPEAN CIVILIZATIONS. *India.* In order to understand the handicrafts of the Orient, esthetic and religious attitudes must be considered; such attitudes often inspired even the most humble handwork. In Vedic and Hindu India, every creative expression was believed to be derived from religious inspiration. Creative expression was considered in some way a

manifestation of life, which in itself was felt to be holy. Painting, sculpture, music, the dance, architecture, and the decorative and applied arts were linked to one another; a vision of man and the universe as an integrated whole prevailed. The value and esthetic quality of the work of art, whatever it might be, were further determined by the spatial proportions, by principles which might be called geometric, and by an elaborate symbolism of color. The science of proportions (*pramāṇa*), which was based on relationships of length, width, and thickness, was applicable not only to architecture and sculpture but also to objects such as jewelry, weapons, beds, ritual earthenware, and ornaments. Because every color with its full range of shades corresponded to definite emotive themes, the choice and distribution of colors were treated as carefully for the minor arts as for the more complex arts. Color and proportion determined the visible structure of the object, which theoretically acquired life and meaning only by being permeated with rasa (Skr., *rasa*) — that is, only in so far as it was able to give rise to an esthetic emotion (see ESTHETICS).

The principal products of Indian handicrafts were stone-, ivory-, enamel-, and metalwork, baskets and mats, wood sculpture, jewelry, pottery, and cloth, including printed and embroidered fabrics. The characteristics which handicraft traditions assumed in India appeared solidly established in the cultural centers of the Indus Valley civilization of the 3d–2d millennium B.C. Three basic trends were gradually elaborated: The first, reflecting popular attitudes, was characterized by a conception of life and work which was agricultural and reflected the familiar and unchanging forms of the village, the social unit typical of India; it was in the village where the depository of an uninterrupted tradition of decorative skill survived. The second trend, which may be called "classic," was elegant, sophisticated, full of ideological conceptions, and rich in symbols and myths; it reflected the great sources which fed it — the temple and the court. The third trend was tied to commerce and the export of products to the markets of Europe, Asia, and Africa.

In the first of the above-mentioned currents in Indian handicrafts, anonymity prevailed. A lack of interest in the material value and durability of the produced work was also evident. Massive clay figures (horses, elephants, human beings) were shaped on the occasion of religious ceremonies and were later left in fragments along the roads; paintings full of poetry, painted on walls by the women of Mithila in connection with marriage ceremonies, were later covered by a coat of plaster. It is almost impossible to trace the chronology of this spontaneous art, which is separated from the great cultural currents and does not involve economic interests. In contrast, we can note the presence in northwest India of signatures on works of a higher level belonging to the second trend, such as the famous Kanishka reliquary signed Agesilas (Agiṣala, or 'Αγεσίλαος).

The grammarian Pāṇini uses the term *śilpa* (craft) in referring to organized artisans. The concept includes — without any special distinction — the crafts of barbering, carpentry, laundering, dyeing, dancing, painting, pottery making, weaving, tailoring, and arrow making. The artisans traced their origin to Viśvakarma, architect of the gods; they united in free guilds known as *śreṇi*. At one time the exclusive character of individual trades was not rigidly defined, but the son ordinarily followed the occupation of his father. With the later development of Indian society, a strict separation of castes and of occupations arose, and the hereditary basis of handicraft organization was firmly established. The handicraft guilds became powerfully organized bodies, with a sphere of activities locally defined. The son of an artisan grew up in the atmosphere of the workshop and, in continuous contact with living traditions, unconsciously acquired familiarity with the forms, symbols, and techniques of the trade. The heritage of knowledge, passed on from father to son and from teacher to pupil, was also transmitted by means of diagrams, sketches, and formulas composed in Sanskrit verses.

The Indian artisan was both a designer and an executor; the customary distinction between art and handicrafts had no meaning, though the term *śilpin* (craftsman; cf. above, *śilpa*) means something closer to "artisan" in a broad sense than to "artist." In any case, the artist who conceived the Maheśamūrti group at Elephanta moved along the same traditional line as the minor decorators and the stonecutters who carved the caves of Elephanta. The Indian artisan learned from tradition the elements of his formal expression, his symbols and designs, data concerning geometric and proportional values, and an awareness of functions; but he was not inaccessible to foreign influences. The various invasions of India brought with them skilled artisans as well as technical innovations, and a mutual exchange of artisans took place between India and northern Asia. Under the Moghuls there originated the royal *karkḥana* (workshops) for the needs of the emperors and the courts. With these workshops new elements intervened to modify the old handicraft experience. In the *Ā'īn-i Akbarī*, a work by Abū'l Fadl 'Allāmī in which the royal workshops of Akbar are described, mention is made of the *naskṣa bandha* (designers of cloth), who arrived in India from the handicraft centers of Iran. The function of designer then became separated from that of executor, and with the passage of time the artisan became merely an executor. A fundamental change subsequently took place in the conception of the object: in the old tradition the object was seen as a structural whole; but in the courts of the Moghul emperors the accent was shifted from structural design to elements of execution such as calligraphy, enamelwork, and inlay devoted to decoration of surface and richness of detail. A break between handicrafts and the arts of sculpture, painting, and architecture then occurred. In some isolated centers in southern India, temples and religious communities continued to protect the old handicraft traditions, but these declined rapidly in the rest of India.

In the *karkḥana* of the Moghul emperors, jewelry, enamelwork, marble carving, jade and ivory carving, engraving on silver, and brocade weaving flourished; objects of great refinement were created, their calligraphic design inspired by a characteristically Moghul love for gardens and hunting scenes. With the decadence of the royal courts, the *karkḥana* lost their original character and became centers of large-scale production designed to satisfy the demand for curios and exotic objects for foreign markets.

From very remote times, trade relations existed between the cities of the Indus Valley and Mesopotamia. As far back as 3,000 years ago ivory objects, embroidery, and colored cotton were shipped on Indian vessels to Babylonia and the court of King Solomon. Indian muslins were very highly prized at the courts of the Roman emperors, where they were referred to as being "woven of air." Carved ivory and fragments of jewel boxes of the Gupta period (6th cent. of our era) have been found at Begram (anc. Kapisa), Afghanistan. For centuries the Near and Middle East, Africa, and the courts of Europe continued to order the products of Indian handicrafts. But as a result of industrial development, the growth of the middle classes in the West, and the subsequent enlargement of the handicraft market, demand turned toward more inexpensive products. Handicraft associations formed in the cities and, exclusively concerned with products for export, lost all contact with the original decorative tradition; their wares became mechanical and devoid of originality.

Pupul JAYAKAR

*China*. A history of Chinese handicrafts — meaning the whole of the products of the various techniques — is identical with the history of Chinese art. Painting, however, was the only representational art in China to have been considered art in local treatises. The Chinese regarded painting as a vehicle of thought. Nonetheless, they looked upon objects which Westerners consider handicrafts (e.g., jade, ceramics, textiles) as sources of intellectual enjoyment and not merely stimuli to hedonistic pleasure. The intrinsic value of the materials employed by the craftsman was highly prized, and a symbolic and esthetic value was attributed to the objects themselves.

A hierarchy of the arts was, however, an inevitable reflection of the social hierarchy. At the base of the former was the particular skill involved and the more or less noble function

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

of the object produced. There are texts in which the nobility of painting is clearly exalted as a spiritual activity, distinct from the trade of the glazer or the mason. Sculpture was always less exalted in China — a handicraft rather than an art because of the fatiguing manual labor required to produce it. While the names of famous painters are almost infinite in number, the names of famous sculptors are very few.

The professional artisan, a person who worked on order and for others, appeared at the time of the Shang dynasty (16th–11th cent. B.C.); from that dynasty comes the first signed lacquer. The *Chou-li* ("Ritual of Chou," a work written possibly in the 3d cent. B.C., referring to the period of the Chou dynasty, 11th–3d cent. B.C.) speaks expressly of the *t'ao-jên*, or terra-cotta makers, and tells us that at court there was an official charged with supervising production. The *Chou-li* also reveals that in the social hierarchy artisans constituted the fifth class of workers; further, the text tells us of the existence of rigidly fixed and inviolable technical and formal standards, which opposed any innovations in tradition.

The advent of Buddhism increased commercial and handicraft activities at the expense of agriculture. The spread of Buddhist communities caused the appearance and growth of various trades: architects, statue makers, painters, goldsmiths, and copyists, who were called upon to work for the needs of the cult. By the beginning of the T'ang dynasty the faithful acquired statues which were kept in their own homes, often for the purpose of magic; previously statues had been used only for dedicating at places of worship. The newer practice favored the development of handicrafts in small objects and flourished especially in the 7th–8th century of our era. In 714 an imperial decree forced the closing of artisan shops in which alcoholic beverages were sold; these shops also cast Buddhist statues or copied sacred texts. Other centers of activity, besides these shops, were the various Chinese monasteries of Central Asia.

From the beginning of the imperial dynasties in China, it is probable that the more important handicrafts were placed under supervision; however, the existence of real state handicrafts is documented only with the first imperial porcelain factories of the Ming period (14th–17th cent. of our era). All productive activities had a typically handicraft character. Architecture, almost always in wood, decorated with paintings and polychrome ceramics and revealing exceptional typological rigidity, has shown a tendency to survive through the centuries, and almost all forms have maintained themselves to our day. The same tendency to survival, with a perpetuation of forms, occurred in the techniques for working various materials such as wood and bamboo, clay, precious and base metals, skins, jade, ivory, glass, stone, lacquer, and silk. In the history of this enormous and varied production — prized in Europe at almost all times, from the Middle Ages to the 18th century, with its taste for *chinoiseries* — three categories of products can be distinguished: One category aimed at satisfying ritual purposes and often achieved the level of a minor art. Another category attempted to satisfy utilitarian needs, and through the centuries has consisted of production by a large rural class that provided for its own needs by building houses and hand weaving cloth for personal attire. The third category sought to satisfy the demand of the imperial courts and the wealthier classes and therefore followed a more clearly esthetic line. Contacts with the West gave rise to handicrafts designed for foreigners.

In the 19th century Western mechanical civilization was introduced to China and Japan. This led to a distinction between arts, crafts, and industry. At the same time, existing traditional production remained in vogue, especially favored by the foreign demand for products considered typical.

*Islamic civilization.* In the pre-Islamic world distinctions between handicrafts and art were quite difficult; they resolved themselves practically in the critical evaluation of the works — in the fixing of a scale of esthetic values to be recognized from case to case, aside from any distinction of genres. Later, the Islamic world excluded, as the contemporary esthetician Bishr Farès points out, "any hierarchy among the various arts with all that it would imply in distinct disciplines according to the material and the destination of the works." The Islamic world did, however, attribute to architecture and to calligraphy a *de facto* prevalence, also extended to miniature painting. The reasons behind this developing esthetic approach become quite clear when we consider how deeply religious and metaphysical conceptions have pervaded all the artistic manifestations of the Islamic world. Iconoclasm — which among other things explains the absence of monumental sculpture in Islamic culture — constitutes only a partial manifestation of the influence of Islamic religious thought on art; furthermore, iconoclasm was chronologically late, geographically variable, and discontinuous. Much more profound has been the very deep conviction of the transience of things, a sense of impermanence at the base of those currents of Islamic thought which are less deeply pervaded by Aristotelianism. Such a metaphysical orientation has produced a particular vision of space as well as a desire to express or to represent the unknown, the incoercible, the changeable — those elements which belong to the sole reality that is God. Islamic philosophy has thus pushed naturalism and realism in art to a secondary place and given rise instead to the ornate and to the arabesque. In short, it has produced a particular taste of a decorative character which, although it does not preclude the reaching of high artistic levels, eliminates the possibility of stabilizing those hierarchies among the arts which have been accepted in India and in China and affirmed in the West with the Renaissance.

The Islamic artist signs his work, whether it be a miniature, a rug, or a piece of pottery. Although, as the 20th-century writer Aga Oglu observes, in Islamic thought man is a weak creature who owes everything to the divinity, the artist is not able to attain the complete depersonification of the Hindu, who considers himself only the docile tool of divine creation; rather the Islamic artist feels that he operates on a particular plane and, though he does not admit it, is able to consider his own work as a creative act. Thus the signature of the artist remains in Islamic works of art, although the works are often accompanied by expressions of modesty in connection with the insignificance of man. A characteristic concept of Islamic culture is that the materials used in art should possess no intrinsic value (which in turn stems from ideas of the impermanence of things); however, this concept is subject to certain limitations: It is quite true, as the contemporary writer Louis Massignon has pointed out, that "Islamic art prefers to use malleable, humble material, without thickness, such as a flowing dress, a fusible metal," and that "art elevates itself above the material as a kind of reflection"; but this does not preclude the appreciation of work in precious or costly materials. The ceramic goblets of Nishapur, while they present ornament and characteristic stylizations of Islamic Iran, nevertheless can be considered as the transposition — in less precious material — of the figures with which the Sassanid silver goblets were decorated. The technique and material are thus at the service of an ornamental effect, despite proscriptions concerning the use of precious and rare metals.

The position of artisans and artists — clearly separated from men of science, as is proved by an anti-Christian text mentioned by Aga Oglu — was rather low during the first centuries of Islamic civilization. Works of art and technology were considered inferior to pure thought, though it has been noted that the Ommiads, who were genuine Arabs, decidedly encouraged arts and handicrafts. It has also been recorded that foreigners were occasionally to be found among the artisans of the Islamic world and that the Islamic artisans often belonged to religious sects which were not at all orthodox. Toward the middle of the 4th century of the Hegira (ca. A.D. 970), artisans who were gifted with such qualities as to make them artists assumed greater importance through the formation of guilds (*aṣnāf*); the guilds were closely connected with the sect of the Karmathians, which arose among the non-Arab subject populations of Islam. We find traces of this social question in the *Rasa* of the Ikhwān al-Safā, an eclectic school strongly influenced by Hellenistic thought. From the text of the *Rasa*, which contains a section entitled "Sharaf al-Sanā'i" ("The Supremacy of the Trades"),

a certain attitude appears that can be summarized in the words of G. E. von Grunebaum (*Medieval Islam*, 2d ed., Chicago, 1953, pp. 216–17): "The crafts . . . differ in virtue when considered from these five angles: (1) the material on which they work: here goldsmith and perfumer have the advantages; (2) the product they achieve: the makers of complicated instruments like the astrolabe rank highest; (3) the urgency with which their work is needed: this viewpoint favors the weaver, the farmer, and the builder; (4) utility for the general public: bath keepers and scavangers are vitally important for the weal of the city; (5) when taken per se, as skills, without regard to utility, etc., prestidigitators, decorators, and musicians are justified by their accomplishments as such."

**HELLENISTIC ART.** The term "Hellenistic age" generally refers to the period extending approximately from the death of Alexander the Great (323 B.C.) and the subsequent dismemberment of his huge empire to the Battle of Actium (31 B.C.), which sealed the fate of Ptolemaic Egypt, the last of the kingdoms of his successors. In this age, the civilization and art of Greece were widely diffused in the East and acquired a cosmopolitan aspect favoring the emergence of characteristics and orientations that were to prove decisive for the achievements of Rome and of all the West.

SUMMARY. Concepts and chronological limits (col. 284). General considerations (col. 286). Architecture (col. 289): *General characteristics; Types of monuments; a. The temple; b. Monumental altars; c. Propylaia; d. Porticoes, basilicas, and libraries; e. Theaters and meeting halls; f. Halls for popular assemblies (bouleteria, ekklesiasteria); g. Palaestrae, gymnasiums, baths, fountains; h. The lighthouse of Alexandria and the clock tower of Andronikos; i. Houses; j. Commemorative and funerary monuments; k. Cities and city planning.* Sculpture (col. 312): *General considerations; Phases, directions, and schools; Historical development; a. The traditional currents of the early Hellenistic period; b. The "simple style"; c. The "baroque"; d. The eclecticism and classicism of the late Hellenistic period.* Terra cottas (col. 346). Painting (col. 347): *The problem of Hellenistic painting; Schools and styles according to the literary sources; General characteristics; Copies, derivations, and reflections of Hellenistic pictures in Romano-Campanian figure paintings, with descriptions of various Hellenistic pictures; Genre subjects and still life; Landscape; Portraiture; Systems of wall decoration.* Ceramics (col. 366). Gold- and silverwork (col. 373). Gems and glyptics (col. 378). Coins (col. 380): *Macedonia; Kingdom of Lysimachos, including Thrace, Crimea, and western Asia Minor; Pergamon; Syria; Egypt; Minor Hellenistic kingdoms; City coins.* Glass, textiles, rugs (col. 386).

CONCEPTS AND CHRONOLOGICAL LIMITS. The term "Hellenism" appears infrequently in ancient literature, employed in various, sometimes contradictory, senses; for example, it denotes imitation of the Greeks, the use of styles and language purely Greek, the use of the koine rather than pure Attic, and paganism. In modern use the word does not convey any of its ancient meanings. It appears for the first time in modern historiography in the *Geschichte des Hellenismus* of J. G. Droysen (1877–78), who derived it, perhaps incorrectly, from a passage in the Acts of the Apostles (6: 1) which differentiates the Hellenists (Ἑλληνισταί) from the Jews of the Christian community, that is, those who spoke Greek from those who spoke Aramaic. Thus, any Palestinian of non-Greek descent who spoke Greek was considered "Hellenized." According to Droysen, Hellenism is the culture developed by peoples brought into the orbit of Greek civilization by Alexander's conquests and their sequel. The scope of the definition excludes contemporaneous civilization in Greece proper and in countries Hellenized previously. But this exclusion, accepted by many historians since Droysen, breaches the fundamental unity of Hellenistic civilization, the very unity that binds it to the Greek world of the 4th century B.C. Although Greece proper and the countries Hellenized before Alexander did not form part of the new social and economic structure (based largely upon Eastern models) of the newborn "Hellenistic" kingdoms, they nevertheless continued to act, albeit in secondary roles, on the political stage of the civilization they had fostered. Droysen's terms imply a distinction between the history of Hellenism, that is, the history of the countries Hellenized after Alexander, and the history of the Hellenistic age, which would cover those countries as well as the rest of the Greek world. In the field of art history least of all can we accept a limitation that permits us to speak of Hellenism only in connection with art forms deriving from the Hellenization that took place in countries such as Egypt, Syria, Bactria, and not of an Attic, Rhodian, Anatolian — still less of a Sicilian or Italian — Hellenism; for these were among the more active and fruitful regions, and produced art forms more truly Greek and of greater universality.

It is appropriate, therefore, that the term "Hellenistic culture" be applied in referring not only to the defined, circumscribed phenomenon of the progressive Hellenization of the eastern world, but, by extension, to the entire epoch characterized by this process, up to and including the last phase of the Greek world, which has for some time been improperly designated by the terms "Alexandrian age" and "Alexandrianism," an implicit attribution to Alexandria of a function it certainly did not have, that of being the principal center of inspiration of the period.

The chronological limits of the Hellenistic age indicated above (323–31 B.C.) are all but universally accepted. Variants suggested by scholars for the date of the beginning of the Hellenistic age include: 336 (the year of Alexander's accession to the throne); the beginning of the 4th century B.C.; 306 (the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

year of the formation of the new kingdoms); 280 (marking the stabilization of the Hellenistic world, with the three great dynasties — the Antigonids in Macedonia, the Seleucids in Asia, the Ptolemies in Egypt — securely in power). The end date is advanced by some scholars to 146 B.C., the year of the creation of the province of Macedonia, by others to 86 B.C., the year of the fall of Athens. In the political field the dates 323–31 B.C. can be accepted without serious objections: the death of Alexander initiated a new, long period of Greek history, and the Battle of Actium made Rome the center of the ancient world. The adoption of these dates raises more serious doubts in the field of art history, for here artistic events whose dates are not verifiable may have as sharply determinant a character as do political and military events in their sphere. However, there is no need to alter the acepted dates as they have come to be transferred from the field of political history to that of art history, so long as it is borne in mind that their value is largely conventional and practical; in this way the unfortunate errors in historical evaluation that have sometimes resulted from a too rigid and enthusiastic adherence to them can be avoided.

The date 323 signifies not so much the beginning as a particularly important stage of the development that led from the ideals of the 4th century (see CLASSIC ART) to those of the Hellenistic age, and it can be advanced or set back without creating serious misunderstanding. The end date, 31 B.C., signals the transition from Hellenistic to Roman art, but since the term "Roman art" has mainly a chronological significance, this transition has little bearing on style. The assumption that a monument of the Roman age, whether it be found in Italy, Syria, Egypt, or anywhere else in the Roman world, expresses Roman rather than Hellenistic ideals is unjustifiable. The history of the art of the period does not echo that of politics or war. The irresistible thrust of Roman power to the east that culminated with the victory at Actium was accompanied by no analogous thrust of Roman art and culture capable of gradually replacing or dominating Greek art and culture. There is no transition from a Hellenistic art to a Roman art in the strict sense of the word in Greece after 146 B.C., nor in the East after the successive constitution of the provinces of Asia (133), Bithynia (74), and Syria (62), nor in Egypt after it passed from the rule of the Ptolemies to that of the Roman emperors. Each of these regions, while feeling to a greater or lesser degree the effects of the modes and currents originating in the new capital of the world, remained within the great artistic climate of Hellenism and the local traditions. It is with these traditions that so much of the Roman art in the East — from the many portraits of the Fayum to the sculptures of Palmyra, to the architectural monuments of Baalbek, Petra, Dura-Europos, Palmyra, and other sites — is bound up (see ROMAN ART OF THE EASTERN EMPIRE). Thus in the sphere of art, and of culture in general, the Roman phenomenon was quite the reverse of what it was in the political sphere — and the Romans themselves were well aware of this: "Graecia capta ferum victorem cepit" (Horace, *Epistulae*, ii, 1, 156). The art and culture of Greece, which had been reaching Rome for centuries by way of Etruria and the western colonies, flowed to Rome during the Hellenistic age in ever stronger currents. The successive conquests of Sicily and Magna Graecia, of Greece and Asia Minor, of Syria and Egypt, filled Rome as never before with Greek artists and works and fashions (see HELLENISTIC-ROMAN ART). The art produced in Rome after the Battle of Actium, and even much earlier, was Greek or Hellenizing art, in great part owing to the activity of Greek artists, which for a very long time overwhelmed or benumbed creative impulses more congenial to the ancient Roman temperament. Until the second half of the 2d century of our era, the art of the Imperial age remained in the Hellenistic tradition, not as a mere passive recipient and imitator of forms but as the heir to dynamically developing Hellenistic tendencies and ideals, as seen in portraiture, continuous narrative relief, spatial illusionism, landscape, painted wall decoration, impressionistic rendering of forms, and architectural features. This art, which can be said to have been Greek art in the service of Rome — or Greco-Roman — did have new and original aspects, but it was never antithetical to the Greco-Hellenistic genius. No matter how many components are discovered in it, the predominance of the Greco-Hellenistic cannot be denied. Not only did Hellenistic art have one of its chief theaters in the Italy that was in the process of Romanization; it centered there, to live longer and prosper more than it had in the rest of the Hellenistic world in the course of the two preceding centuries.

The farther removed one is from the *Orient oder Rom* controversy and other disputes that postulate a clear break between Hellenistic and Roman art and set East and West in opposition as fundamentally different cultural worlds, the more apparent is the necessity of reconstituting a unity so heedlessly broken up. The historic role that Rome played in revivifying Hellenistic culture and in disseminating Greek art must be acknowledged. In this respect Rome took over the function of the Hellenistic kingdoms: as they had stimulated the diffusion of Greek art in the vast regions of the East, Rome brought Greek art to the West, thereby transmitting this inheritance to the modern age.

The year 31 B.C., then, may be taken to mark the phase in which Rome became the center of artistic production in the Mediterranean world but not to mark the end of Hellenistic art. Not until the 3d century of our era, or slightly earlier, did newly predominant stylistic ideals seem to transcend Hellenistic ideals. But even then it cannot be said that Hellenistic culture was submerged — its figural tradition was to live on tenaciously until the end of the ancient world and then, with other elements, to merge with the Byzantine and Western art of the Middle Ages. Before the neoclassic "rediscovery of Greece" in the late 18th and early 19th centuries, it was the Roman elaboration of Hellenistic art, not classic or archaic Greek art, that the modern age looked to as the antique.

The perpetuation of Hellenistic artistic traditions and tastes in the Roman age and beyond accounts for the expressions "Hellenistic-Roman," "Hellenistic of the Roman age," "Hellenistic-Byzantine." Medievalists and Byzantinists use these terms, as well as the simple "Hellenistic art," to refer to late-antique and early medieval stylistic modes that are really of the Greek tradition.

The difficulty in defining "Hellenistic" as applied to style is apparent. It is vain to attempt to define Hellenism in terms as precise as those applied to other great styles — to Gothic, the baroque, the rococo, impressionism, and the rest. Rather, we may distinguish two applications of the term "Hellenistic" — a more limiting one, set over against "classic," and a broader one, paralleling "Greek" as referring to a Grecism that combines in itself the experience of classicism, of Hellenism properly so called, and also of the Roman age as heir and continuer of Hellenism. The limiting definition draws attention to that aspect of Hellenistic art which moves away from the measured and the ordered, from the forces of tradition, from the idealization of spiritual content and of form characteristic of the classic in the strict sense, and moves toward an art of contrasts, of more thorough and accurate observation and representation of nature: hence the variety of moods, of individual character, of realism in the human figure and its natural surroundings. In this sense of our definition, the classicizing tendencies of late Hellenism, though still of the age called "Hellenistic," no longer represent true and characteristic Hellenistic taste; in Roman art — aside from popular indigenous currents — there can be distinguished both Greek classicizing and truly Hellenistic tendencies. As for the broader application of the term "Hellenistic," it is a matter of finding a definition that will cover all classic and Greco-Roman art. Such a definition was offered in 1955 by Bianchi Bandinelli: "the artistic forms preserving the essential organic unity of structure which was fundamental to Greek art and to its naturalistic bent" — as distinguished from the schematization or ornamental use of organic form and its distortion for expressionistic ends which are characteristic of the new ideals of the late-antique period (q.v.).

GENERAL CONSIDERATIONS. If, broadly speaking, in its political and cultural aspects the Hellenism of 4th-century Greece was in its infancy, nonetheless it is clear that in many respects it differed profoundly from the Grecism of the preceding period.

With the establishment of the great kingdoms, the Greek cities lost their political predominance and became contested satellites. The new Hellenistic state bore no resemblance to the old Greece of the polis. The sovereign was supreme. The concept of the citizen more as a creator than a participant in the life of the state was a thing of the past. Yet the new regime accelerated the development of the individualism that had taken hold by the 4th century; cultural specialization, virtuosity of technical achievement, and the internalization of spiritual life proceeded at a comparable pace. The Hellenistic man was a citizen of the world. The narrow limits of the city-state gave way to the vast boundaries of the *oikoumene*, to the political ideal of Alexander and the Diadochi of the fusion of the races; great new metropolitan centers arose thronged with restless crowds of natives, Greeks, Macedonians, Jews, and foreigners of every description. The diffusion of the Greek tongue, in the form of the koine, was world-wide; Greek culture was universalized, affecting and being affected by every country it entered. Eclecticism in art was born. Under princely patronage scientific research and the arts flourished, benefiting from the establishment of such institutions as the Mouseion and Library in Alexandria. The science of philology was born and developed rapidly; the sciences entered a most fruitful period. In religion the weakening of faith in the old Greek gods of Olympos opened the way to an influx of exotic religions.

With the decline of the great ideals of the past, poetry, when not erudite or courtly, turned to the particular: genre subjects, romantic impressions of nature, and amorous sentiments were the preferred themes and types. Similarly, philosophy turned from abstruse metaphysical problems to a largely religious concern with the spiritual life of the individual. Stoicism and Epicureanism, more especially, with Cynicism, represent the main directions taken by philosophical thought; significantly, they also had great success with the Romans.

Historians do not agree in their interpretation of Hellenistic culture — its uniformity, the role of Eastern elements in its formation and development, its intrinsic significance. In point of fact, because of its remarkable extent in time and space and the heterogeneity of its constituent elements, the Hellenistic world, if fundamentally unified, reveals a clearer and more profound differentiation from region to region than is commonly realized. Especially in the field of art, Hellenism had different aspects in Athens and in Alexandria, in Egypt and in Asia; furthermore, in Egypt and in Asia it varied from place to place according to whether Greek culture was rooted or ephemeral. Eastern influences, too, had different effects in different areas of culture and in different countries of the Hellenistic world. To be sure, in the determination of the structure of the new society and in the sphere of religion, Eastern influence was stronger than in the field of art, it we consider that certain manifestations of Greco-Oriental eclecticism — for example, Greco-Egyptian and Greco-Buddhist art, which grew out of limited contacts — only rarely achieved universality. It is a fact, on the other hand, that in its most vital form Hellenism remains predominantly Greek and that however much it was affected by the contacts with the East, there is no aspect of Hellenistic life which does not have its own precedents in that period of ferment and crisis in Greek life that was in evidence by the 4th century: the crises of the polis and of religion, the first penetration of Eastern doctrines, the orientation of spiritual life toward individualism, technical virtuosity, universality of culture, naturalism, even realism. To find precedents for Hellenism in the classical age is not necessarily to gainsay its originality. All that has been said about its general characteristics — the high level of so many of its creations in the field of art, the vitality and staying power that enabled the directions of its thought and art to continue beyond the end of the Hellenistic age — indicates how mistaken such a disparaging judgment would be.

The interpretation given above of Hellenism and its spatial and temporal range would seem logically to call for an account of Hellenistic art according to centers and regions and extending through the greater part of the Roman period, especially in the East. This would be difficult to achieve, given the incompleteness of scholarly studies in the field and the serious gaps in our knowledge of Hellenistic art, and such an approach might lead to confusion rather than clarification. Hence the

account of Hellenistic art that follows adheres to current practice in the field and is arranged in historical and typological sequence.

ARCHITECTURE. *General characteristics.* Uncertainties in the present state of knowledge concerning Hellenistic architecture are due in part to the grave loss of monuments, in part to the lack of development of this field of study. Perhaps because the architecture has been less understood than any other branch of Hellenistic art, it has most often been labeled decadent. Coming as it did between the severe splendor of the architecture of the classic age and the bold innovations of the Roman age, Hellenistic architecture might appear arrested in tired and corrupt forms, its traditionalism in singular contrast to the rich and creative new sculpture. But if the standard applied is the aims and achievements of Hellenistic architecture itself, and not those of classic architecture, the verdict is at once reversed: a vital and mature art is revealed — rich in contrasts, containing the seeds of innovation, an art whose study is essential to an understanding of the historical position of Roman architecture. Admittedly, there is a strong conservative or traditional element, but this is not so great as it was in the preceding age (the contrary is perhaps nearer the mark) and does not impede the trend to innovation. In the contrast between the one and the other, Hellenism inscribed, even in architecture, a decisively important chapter of the history of art.

The traditional orders of Doric, Ionic, and Corinthian continued to be employed (PL. 150), but in a manner at once carrying on the process of development begun in the preceding era and affirming the peculiarly Hellenistic need for novelty and variety. Even if the Hellenistic architects no longer understood the Greek architectural orders — especially the Doric — in the purity of their original form, and combined the orders indiscriminately, they arrived all the same at felicitous solutions of their own. The Doric column, continuing to diminish in entasis, grew slim and rigid. The lower third of the shaft was often smooth and unfaceted rather than fluted, and the number of triglyphs over the intercolumniations increased variously. The Ionic order, because of its slenderness and elegance, made a stronger appeal to the taste of the times and was extensively used; the preferred base was the so-called "Attic" type; the shaft appears in a variety of forms; and a frieze, with or without reliefs, is almost always present above the architrave. Often there is a fusion of Doric and Ionic elements (Ionic entablature on Doric columns or vice versa; egg-and-dart on Doric capitals) or Corinthian and Doric elements (Doric entablature on Corinthian capitals). Likewise, in the two-storied porticoes which were common in this period the Doric is frequently employed for one story (generally the lower) and the Ionic for the other. Characteristic of the Hellenistic age is the expanded use of the Corinthian order (Corinthian capital with Ionic elements), which makes its appearance on exteriors as well as interiors, following a trend prefigured as early as the 4th century B.C. (choragic monument of Lysikrates; X, PL. 156). Roman architecture was to inherit and make wide application of this exterior use. The Corinthian capital offered architects the greatest possibilities of varying the earlier types by playing with the number and distribution of elements as well as with the plant forms themselves. Among these they often interpolated figural elements such as human and divine heads and busts, protomas of animals or of fantastic beings. Alongside the more traditional capitals appear many new and singular forms: capitals of exotic character (palm shapes, aquatic plants, mixed Egyptoplant forms in the lateral parts or in the channels between the Corinthian styles); Ionic capitals with more or less stylized volutes (in a round building at Ephesos all the elements of the Ionic capital were directly supported by rich plant motifs); capitals with volutes diagonally arranged; capitals ornamented with a necking of rosettes; capitals flanked by two bulls' heads on the architrave. The large rosette is often introduced as a motif in metopes of the Doric frieze, and in the Lesser Propylaion of Eleusis metopes and triglyphs carried even less congruous motifs. In entablatures of the Doric and Ionic orders the bucranium motif is often made use of, as is the frieze with bucrania and garlands; both are widely adopted elsewhere as decorative motifs. Sometimes column shafts rise from clusters of palm or acanthus leaves. The column on a pedestal, which was afterward to achieve wide currency, was introduced, and the applied half column became popular; these two motifs were to be much used in Roman architecture.

From the combination of three-quarter columns, half columns, and quarter columns with piers, new forms of supporting elements were born. The so-called "ivy-leaf" pier was formed by setting a corner pier between two quarter columns; the pier (or column) with an ellipsoidal section resulted when two half columns were applied to opposite faces of a rectangular pier; the rectangular pier was also joined with three-quarter columns on two opposing sides. Wider doorways with architraves often incorporated applied columns and piers in new combinations. Fairly frequent was a singular use of half columns applied to the rear faces of the central and lateral jambs, to adorn the interior of a doorway rather than the front.

Hellenistic architecture is conservative in its predilection for the straight line both in the plan and in the elevation. Reluctance to adopt and exploit the curved line can be discerned in the case of buildings in which curvilinear elements are present in the plan or elevation but are contained and concealed in external, rectilinear forms [the building with apses below the Pergamon altar, the Bouleterion of Miletos, the Hieron of Samothrace, the small theater of Pompeii, Macedonian tombs, the Didymaion (Temple of Apollo at Didyma) near Miletos, the gates with architraves in front of the vaulted rooms of the gymnasium in Pergamon]. This reluctance persists into the Roman age, as the Odeion of Agrippa in the Athenian agora bears witness. On the other hand, Hellenistic architecture also reveals a distinct interest in curvilinear elements: its circular buildings, vaulted gates and passages, apses, and perhaps even domes are prototypes of the great vaulted architecture of the Roman period. The tholos with columns, a type introduced in the preceding period, continued in use and spread to new areas; the tholos on the *thalamegos* (state barge) of Ptolemy IV of Egypt (described by Kallixeinos, as quoted in Athenaeus, v, 205d), the tholoi in the decorative schemes of Pompeian Style II painting, the so-called "Temple of Vesta" (or "of the Sibyl") in Tivoli (PL. 201), and the Temple of Roma and Augustus on the Acropolis of Athens may be cited. A new version of the circular building made its appearance with the Arsinoeion of Samothrace — a high, unarticulated wall is crowned by a simulated gallery of Doric pilasters on the exterior and Corinthian half columns on the interior. In monumental funerary, commemorative, and utilitarian structures (e.g., lighthouses), circular shapes were often superimposed on cubical and polyhedral forms (the round building at Ephesos, the lighthouse of Alexandria, the tower of Taposiris, etc.). Meanwhile, in several areas there spread a type of tomb with a tumulus on a high, walled ring, often architecturally articulated (the so-called "tomb of the Christian woman" in Algeria; I, PL. 18). The curvilinear element appears in apses (the Hieron of Samothrace; the building below the Pergamon altar; Tomb 3 in the necropolis of Mustafa Pasha in Alexandria, FIG. 306), in exedrae with statues (exedra of the Serapeion in Memphis, the Alexandrian nymphaeum well known from a papyrus of the 3d century), and in the niches of façades [the gate of Perge; a structure at Todi; the sanctuary at Praeneste (mod. Palestrina, PL. 199); the gate of Mithradates at Ephesos], all of which anticipate, once again, motifs and tastes of later ages.

Vaulting was in wide use for covered passages, ramps, stairs, aqueducts, foundations (in Pergamon, Didyma, Perge, Samothrace, Aigai near Myrina in Asia Minor; in the cisterns under the 3d–2d century basilica in Pompeii; in Macedonian, Alexandrian, and south Russian hypogea). In a Pergamene tomb a cross vault is used, and in an Alexandrian hypogeum there was, perhaps, a domical vault. The great Alexandrian hypogeum of Wardian, dug out of living rock, which has in its central area evidence of a large circular room covered by a dome, may perhaps be dated to the Hellenistic age; there is a comparable example in Naples, where in the subterranean Tomb of the Virgins a ring of columns supports a domed roof over the circular central room. This type of covering occurs

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

but rarely in the Hellenistic age (the Stabian Baths and Forum of Pompeii, the Temple of Mercury at Baia, and perhaps the baths of Oiniadai). The pseudo-dome of Mycenaean type is perpetuated in tombs of Thrace and southern Russia. Rows of arcades on piers with a primarily structural function, made to be concealed from view, are known in Hellenistic (substructure of the Stoa of Eumenes II in Athens) and also in Roman contexts, where the structural and decorative functions are combined (Praeneste, the Tabularium in the Roman Forum, and related architecture). The dike (Heptastadion) that joined Alexandria to the island of Pharos must have contained a long row of arcades, a device which was to gain great popularity in Roman usage (exteriors of theaters, amphitheaters, basilicas, etc.). Examples of wall painting in Pompeian Style II (Villa of the Mysteries) and of pre-Augustan Pompeian dwellings (houses of Meleager, the Labyrinth, the Silver Wedding) prove that late Hellenistic architecture even used arcading (rows of arches springing from columns). This motif was to be resumed and developed much later in Roman architecture (the forum at Leptis Magna, the palace of Diocletian at Split), and in Early Christian architecture, and was to be launched again with a new clarity of expression in early Renaissance architecture. There are reasons for thinking that the motif may have been Alexandrian in origin. Finally, the arch is employed in the interior doors of buildings and in entrances to specific enclosures (the principal gates of Dura-Europos, as early as 300 B.C.; the doors of the Ekklesiasterion and the lower gymnasium of Priene; the entrance to the agora of Priene and to the terrace of the upper theater of Pergamon; the door of the Stoa of Attalos in Athens; and the gates of Perge and Assos). The frequency with which arched spaces are reproduced in the late Hellenistic funeral steles of Asia Minor is conclusive evidence that the arch was more common than the surviving monuments suggest. Apsidal niches covered with basin or shell shapes were also used, if sparsely, in the Hellenistic age (the example of the upper Peirene fountain in Corinth dates from about 237 B.C.); they were to be used extensively later. Even the technique of baked brick, used widely by the Romans in the Imperial age, has Hellenistic precedents, which suggests to some that the technique is of Eastern origin (palace of Nippur, Mesopotamia; late Hellenistic structures in southern Italy).

It bears stressing that even as regards monumental types (see below), Hellenistic architecture was far from wasting into a tired conservatism. The taste for the façade prospect, for axial disposition, for symmetry, and for scenographic effects are all distinctive qualities of Hellenistic architecture that herald later developments. The autonomy that made the classic building an almost sculptural work, intended to be viewed from all sides, is not characteristic of the Hellenistic building. Coordinated with other, neighboring buildings, related to the surrounding space, and sometimes to the landscape, it is often conceived to be viewed primarily from the front. This led to axial and symmetrical disposition: temples were placed in the center or at the far end of porticoed squares accessible only from one side (Temple of Mamurt Qal'e near Pergamon; sanctuary of Artemis at Magnesia ad Maeandrum; Temple of Asklepios on the upper terrace of Kos, etc.). It also led to the concept of great rectangular areas with porticoes on three sides and a wide entrance stairway on the fourth and of great monumental complexes with terraces accessible by long flights of steps placed on the axes (sanctuaries of Asklepios in Kos, Fortuna Primigenia at Praeneste, Athena at Lindos, in Rhodes). On the Acropolis of Pergamon the terrace construction was adapted to the special conditions of the terrain with manifest variety and freedom: the rising terraces unfold fanwise about the pivot formed by the terrace of the theater. The increased interest in the façade as prospect also encouraged the articulation of walls by columns, piers, and false or real doors, and the practice of repeating the interior articulation of the building in the façade by such means as horizontal cornices, piers, and false colonnades (Bouleterion of Miletos, Arsinoeion of Samothrace).

All that has been said indicates how alive and how productive of important innovations was Hellenistic architecture. Entire metropolises, such as Alexandria and Antioch, and innumerable cities established by Alexander and the Diadochi and their successors in the vast regions of the Hellenized East are virtually unknown today. Of many others our knowledge is fragmentary or is limited to the Roman age (Ephesos, Miletos, Aphrodisias, Palmyra, etc.). This alone is enough to lend weight to any traces of the existence of architectural forms profoundly divergent from the bulk of those that are known to us. To be sure, such forms, despite the many new elements they present, remain faithful to the spirit of clarity, sober elegance, linearity, and equilibrium peculiar to the tradition of Greek architecture. But certain signs force upon us the suspicion, however arbitrary this may appear, that there is an entire aspect of Hellenistic architecture which remains unknown: some of the magnificent and unusual architecture appearing in Pompeian Style II wall painting at least in part derived from real architecture (broken pediments, the strong and animated plastic modeling of the walls with columns on podia or pedestals, large consoles, architectural motifs in the center of other similar motifs, alternating triangular and curvilinear pediments, rare polychrome materials, and the profusion of decorative metalwork among the architectural elements); the depiction in landscape paintings and stuccoes of the 1st century B.C. of religious structures with concave façades, often in series, corresponding to nothing in the extant architecture of the period; certain rich and *mouvementé* architectural elements of Petra, of the palace at Ptolemaïs, in Cyrenaica, and of the mausoleum near Capua known as "La Conocchia" (given the generally accepted dating of these monuments in the Hellenistic age); and finally the fact that some parts of the magnificent and sumptuous architectural complex of the Acropolis of Baalbek seem to date from the Augustan or Julio-Claudian age. The aspect of Hellenistic architecture represented by these monuments can best be characterized as paralleling the widely documented baroque style in Hellenistic sculpture, an aspect that must have constituted the prototype of the Roman "baroque" architecture of the 2d century of our era.

Turning to problems of space, there is no question that there was a sharper awareness of them in the Hellenistic phase than classical architecture displays. Despite the timid and unsure use of the arch and the vault in Hellenistic architecture, and the modesty of its achievements in enclosing unbroken expanses of interior space as compared to Roman monuments, it is clear from the handling of the pseudodipteral temple that a new sensitivity has profoundly modified the peristyle of the Greek temple. The Arsinoeion of Samothrace, notwithstanding its conical roof, encloses in its ring a broad interior space, and the Alexandrian tomb of Wardian, which may belong to the 1st century B.C., has a large rectangular intermediary room and domed main room on axis with the open court. These examples of the taste for unbroken interior space are forerunners of later achievements in the Roman age. But more numerous and explicit are the indications of the Hellenistic feeling for exterior space, which is manifest in the enclosing of great open spaces and in the coordination of buildings with one another and with their surroundings. It was this sensitivity that gave rise to many of the characteristics which have been mentioned above: the widespread use of public areas enclosed by porticoes and peristyles; the organic coordination of urban complexes; the well-planned terracing of city and sanctuary; and the predilection for axiality, symmetry, and façade prospects.

Although the differing characters of the various centers of production are not yet completely understood, it is certain that Hellenistic architecture had its own particular idiom in Greece and Asia Minor, in Syria and Mesopotamia, in Egypt, in North Africa, and in Italy. The best-known of these areas is the Aegean-Anatolian, represented by islands such as Delos, Kos, Samothrace, by the kingdom of Pergamon, and by the cities of Priene, Magnesia ad Maeandrum, and Miletos. Athens and the rest of Greece proper can be related to the Aegean-Anatolian area partly because a number of monuments erected in Greece in this period were donated by monarchs who gave their names to architectural monuments of Asia Minor as well, and partly because Aegean-Anatolian architecture remained particularly faithful in spirit to the traditions of the architecture of mainland Greece. Italy is equally rich in archaeological material, with

centers in Sicily, Magna Graecia, and, most notably, Pompeii, Herculaneum, and Latium, where Hellenistic architecture had special distinguishing characteristics. In Latium and in Rome there are manifestations so distinctive and so new as to constitute not only an interesting chapter of Hellenistic architecture but the introductory chapter to the great work which is Roman architecture of the Imperial period. There are many gaps in our knowledge of the other centers, but work in the field and the critical study of known monuments are constantly illuminating new aspects and problems of Hellenistic architecture in Syria, Egypt, Cyprus, and Cyrenaica, and we can look forward to a fuller knowledge of the entire subject.

Hellenistic architecture offers ample evidence of continuity in the development from Greek to Roman art. The more obvious aspects of this continuity, decorative motifs and the architectural orders, are not so important for the subsequent development of Roman architecture as some original Hellenistic features that served as antecedents to Roman forms: types of structure such as the basilica, the circular mausoleum, the commemorative arch, and the nymphaeum; the modifications introduced in theaters and dwellings; the unified conception of monumental complexes; the tendency to axial disposition, symmetry, and frontality; the first tentative ventures in varying the uses of the arch, the vault, and even the dome; the taste for monumental town planning and also for the particular baroque expressions, already mentioned, that somehow, in architecture, seem alien to the more authentic Greek taste.

*Types of monuments. a. The temple.* In general, the temple is the building form that remains most faithful to tradition: the peripteral style for major temples, the prostyle form and, less frequently, the *templum in antis* for minor ones. However, even in this area Hellenistic architecture also produced a form that can be considered new and that is one of its triumphs. The pseudodipteral temple, a dipteral form in which the intermediate ring of columns between the cella and the external peristyle has been eliminated, had been known in Greek architecture in Sicily and Kerkyra (Corfu); the Hellenistic contribution was to adopt a new scheme of proportions embracing plan and intercolumniations, so that the cella was enclosed by a wide and airy pteroma. This innovation is linked with the name of the architect Hermogenes (variously dated, from the end of the 3d cent. to the second half of the 2d), who was actually merely its advocate, and perhaps, in his lost writings, its expositor. Hermogenes' principal work is the Ionic Temple of Artemis Leukophryene at Magnesia ad Maeandrum (FIGS. 294); an earlier work of his was the Ionic Temple of Dionysos at Teos in Asia Minor. Examples of the Hellenistic pseudodipteral temple include, in the Ionic order, the Temple of Aphrodite at Messa (Lesbos) and the Temple of Apollo Smintheos in the Troad, both perhaps antedating the temple at Magnesia; the Temple of Apollo at Alabanda constructed by Menesthes (2d cent. B.C.); the temple of Ankyra (2d cent. B.C.?; later called the "Temple of Roma and Augustus"). Corinthian pseudodipteral examples include the Temple of Hekate at Lagina (2d–1st cent. B.C.) and the Temple of Zeus at Aizani (Phrygia), a well-preserved, wholly Hellenistic work dating from well into the Roman age (ca. A.D. 125). The colossal Temple of Apollo at Didyma, near Miletos, built on the site of an earlier structure, is also assigned to the Hellenistic age (PLS. 147, 150); begun in the last quarter of the 4th century B.C. by the architects Paionios of Ephesos and Daphnis of Miletos, it was finished only at the beginning of our era. This sumptuous hypaethral temple of dipteral type with 120 Ionic columns is in the Asia Minor tradition of the colossal temple, which was still active in the 4th century (Sardis, Ephesos). A late Hellenistic Ionic temple (46 B.C.) is the peripteral structure dedicated to Apollo Chresterios near Aigai (between Kyme and Myrina in Asia Minor). One of the earliest examples of the Corinthian order is the peripteral Temple of Zeus Olbios near Olbia (Cilicia), from the beginning of the 3d century B.C., but the most important is the Temple of Zeus Olympeios in Athens (PL. 149; I, PL. 404), erected by Antiochos IV Epiphanes (175–163 B.C.) on the site of a Doric temple built by the Peisistratids. Not finished in Hellenistic times, the temple was worked on under

Magnesia ad Maeandrum, Temple of Artemis Leukophryene, elements of the architectural order (*from Lawrence*).

Augustus and completed and consecrated under Hadrian, so that the dating of the surviving elements is uncertain. The architect was Cossutius, doubtless a Romanized Greek; according to Vitruvius (vii, Preface, 15), he built the temple up to the architrave. Among the other Corinthian temples of the Hellenistic age are numerous examples from the late republican period (temples of Apollo and Jupiter, 1st cent. B.C., in Pompeii; many elements of the two sanctuaries at Praeneste, besides the round temples mentioned below). In the Roman age the building of Corinthian temples was widespread in Asia Minor. Among the examples of temples with mixed architectural orders are the so-called "Temple of Peace" at Paestum and the small

temple of the upper market at Pergamon (2d cent. B.C.; prostyle and tetrastyle on a small podium, with Doric-like capitals on columns of Ionic type, a Doric frieze, and Doric-Ionic elements in architrave and cornices).

The Doric temple in the Hellenistic age can be said to have outlived its greatness, continuing the process of stiffening and slenderizing so contrary to the nature of the order and already so marked in the 4th century B.C. None of the many known examples (Delos, Pergamon, Troy, Kos, Samothrace, Lykosoura, etc.) merits special mention.

In the Hellenistic age the use of the circular temple (tholos) with peristyle continued to spread. The shrine on the Egyptian state barge of Ptolemy IV must have been of this type. The only example which has been preserved in Greece dates from the beginning of the Roman age: the small temple on the Acropolis in Athens dedicated to Roma and Augustus (Ionic monopteral without cella). The surviving Italian examples are Temple B of the Largo Argentina in Rome; the so-called "Temple of Vesta" (Corinthian) in the Forum Boarium in Rome; the small tholos at the top of the main sanctuary of Praeneste; and, most outstanding of all, the "Temple of Vesta" in Tivoli (beginning of 1st cent. B.C.), a jewel of pure Hellenistic architecture (PL. 201). A special type of tholos, designed for an unknown but certainly sacred purpose, is represented by the Arsinoeion of Samothrace. This large, circular edifice was dedicated by Arsinoë II (270 B.C.) to the great gods of the island. More unusual than the tholoi with pteromata, in fact unique, the Arsinoeion is related to other types of round structures popular in the Hellenistic age (funerary and commemorative monuments).

In a class by itself is a type of Hellenistic sanctuary dedicated to the cult of a ruler, which seems to have come to Rome from the east. An example occurs as early as the 3d century, in the sanctuary of Hermoupolis in Upper Egypt dedicated to Ptolemy III (246–221); the original complex (Doric and Ionic) may also have had superb Corinthian capitals (PL. 150). Hellenistic precedents, in turn related to the tradition of the pharaohs, are indicated for the sumptuous Alexandrian edifice known in the sources as the "Kaisareion" (Caesareum; later as the "Sebasteion"); this vanished structure, begun by Julius Caesar and completed by Augustus, had among its features propylaia, temples, porticoes, works of art (Philo, *De legatione ad Gaium*, xxii, 150, 151). The Kaisareion of Antioch, which has also vanished, was built a little later than that of Alexandria. It is very probable that a building found at Cyrene, and known by the name of Kaisareion, belongs to this series. A very wide, four-porticoed, Doric structure with two propylaia, small temple in the center, and adjacent basilical building (perhaps added later), it was of the end of the Hellenistic age and was perhaps originally dedicated to Octavian rather than to Julius Caesar.

Within the orbit of Hellenistic temple architecture — in view of the slender elegance of forms and the elements of elevation — may be placed a number of Italic temples of the late republican age, despite the fact these almost always remain faithful to the local tradition of a temple on a high podium, sometimes with complete peristyle, sometimes with colonnades limited to three sides. They include, to mention the most significant, the "Temple of Peace" at Paestum (3d–2d cent. B.C.), the temples at Gabii (3d–2d cent. B.C.), the Temple of Jupiter in Pompeii in its 1st-century forms, the three temples in the Forum Holitorium in Rome (3d–2d century B.C.), the small "Temple of Hercules" at Cori (beginning of 1st cent. B.C.; PL. 201), the "Temple of Vesta" in Tivoli (beginning of 1st cent. B.C.), the pseudo-peripteral Temple of Fortuna Virilis in the Forum Boarium in Rome (ca. mid-1st cent. B.C.). The tholos type of temple is represented by the example in Tivoli and, in Rome, by Temple B of the Largo Argentina (3d–2d cent. B.C.; FIG. 397) and the "Temple of Vesta" (Temple of Portunus?) in the Forum Boarium, as early as the Augustan age. What remains almost totally unknown is the Hellenistic temple architecture of the Hellenized regions of the East. The many surviving monuments of Palmyra, Gerasa, Baalbek, Suwaida, Amman, Dura-Europos, and elsewhere are for the most part from the Roman period, and in the unusualness of many of their forms they raise once more the recurrent problem of the place occupied, within the orbit of local Greco-Hellenistic traditions, by influences from the East, often very strong, and from the Roman West.

*b. Monumental altars.* A typical and, in a sense, original expression of Hellenistic religious architecture is the monumental altar within a sacred enclosure, known from examples in Syracuse (altar of Hieron II, 269–215 B.C.), Priene, Magnesia ad Maeandrum, Samothrace, Kos, Lykosoura, and Pergamon (reign of Eumenes II, 197–ca. 159 B.C.; FIG. 296; PLS. 172–174). The Pergamon altar is the most imposing and the most important because of its great richness of decoration; the immensity of its proportions, the position on the high podium, the height and width of the entrance staircase, and the splendor of the decoration combine to invest this monument with exceptional grandeur. The effect is somewhat diminished, however, by the slender and elegant Ionic colonnade and by the rectilinear simplicity of the architrave and cornices, which contrast singularly with the agitated movement and the strong mannerism of the light and shade effects in the great gigantomachy frieze that occupies so prominent a place in the elevation. The two Ionic altars of Magnesia and Priene can be considered reduced imitations of the Pergamon altar; they have been attributed to Hermogenes.

Pergamon, Altar of Zeus, reconstruction of the plan (*from Lawrence*).

*c. Propylaia.* A type of monument that is traditional in the Hellenistic period is the propylaion, a monumental entrance to a sacred or secular area or enclosure, or even to a single structure, usually enriched with colonnades on one or two fronts, often with widened central intercolumniation. In certain propylaia there are more or less vivid reminders of the Propylaia of the Acropolis of Athens (III, PL. 337, FIG. 665), which was directly copied in the Roman age (2d cent.) in the Great Propylaion of Eleusis. Numerous examples of this type of monument have been found — at Selinous (mod. Selinunte), Delos, Samothrace, and Pergamon, to name a few of the sites — some rather simple, others of a pronounced monumentality, some with a traditional Doric, others with an Ionic or Corinthian colonnade. Notable representatives of the type are the propylaia of the sanctuary of Athena at Lindos, added to a preexisting structure; the propylaia of the sanctuary of Samothrace, erected under Ptolemy II (285–246 B.C.); the propylon of the Bouleterion of Miletos (FIG. 302), donated by Antiochos IV Epiphanes (175–163 B.C.); the Lesser Propylaion of Eleusis, built about the middle of the 1st century B.C. by Appius Claudius Pulcher; and the two

monumental gates of Ephesos, one from the end of the 2d century B.C., the other dated 4–3 B.C. by an inscription in which two freedmen of Agrippa dedicate the structure to Augustus.

*d. Porticoes, basilicas, and libraries.* The Hellenistic age has been justly termed the age of the portico. Wide use was made of this architectural feature in a variety of forms: as a freestanding structure, as an enclosure of public squares (agoras) and of sanctuaries, and as an interior element of public buildings and of dwellings. An abundance of porticoes is, in fact, the salient characteristic of such urban complexes as Miletos, Magnesia ad Maeandrum, Pergamon (FIG. 297), Delos, and Priene. The fashion passed from Greece to Italy; thus the extensive use of porticoes was characteristic of Hellenistic Pompeii. Particularly in the eastern ambient the street flanked by porticoes was used, as we know from examples of the Roman period that definitely seem to imitate Hellenistic models. Among the porticoes dating from the 3d century B.C. are the long portico of Antigonos II Gonatas in Delos (the so-called "Portico of the Horns"), and the porticoes of Philip V of Macedon in Delos and Megalopolis.

Pergamon, Stoa of Athena, reconstruction of the elevation (*from Lawrence*).

A distinctive type of portico is the one called "Pergamene," examples of which are found not only in Pergamon (e.g., in the precinct of the Temple of Athena) but also in various places in Greece, having been donated to Greek cities by Pergamene monarchs (stoas of Attalos I in Delphi, of Eumenes II and Attalos II in Athens). The Pergamene portico is two-storied, the lower level having Doric columns, the upper, Ionic columns of elliptical section, with stone transennae (often decorated in relief) between them, and with Doric-Ionic elements in the entablature; a row of columns, for the most part with palm-leaf capitals, divides the interior into two aisles. The most famous porticoes are the stoa of the sacred precinct of Athena, in Pergamon (FIG. 297), which also served as a frontispiece to the Library, and the reconstructed Stoa of Attalos II in Athens, which had a row of shops in the rear. The Stoa of Eumenes II at the foot of the south slope of the Acropolis (dated, according to some scholars, to the 2d century of our era) was supported by a wall at the rear of a long substructure of terraced arcades. It fulfilled the additional function served by the portico *post scaenam* of a place of entertainment, offering shelter to the spectators at the neighboring Theater of Dionysos.

In cities situated on hills there developed a type of market portico especially suited to irregular terrain, a type comprising a series of structures standing on more than one plane. Generally the upper portico, with a colonnade, opened on the agora, and the lower ones, in the form of corridors with lines of shops or warehouses in the substructure of the terraces, opened on the levels below (Assos, Aigai, Alinda). A similar system is seen in Pergamon (PL. 148). Covered, colonnaded galleries of one or more aisles widely influenced, and frequently determined, the planimetric conception of individual buildings. With increasing frequency, the portico appeared as a principal constituent of palaestrae, gymnasiums, meeting halls, houses, and villas. The porticoes of the Theater of Pompey in Rome and of the large theater in Pompeii (later used as barracks for gladiators), suggest that the use of the portico *post scaenam* as described by Vitruvius (v, 9, 1) became widespread in the Hellenistic age. The so-called "Portico of the Bulls," erected in the sacred precinct of Apollo in Delos in the first half of the 3d century, is in reality a sanctuary (the Pythion), but its elongated plan suggests a portico. The long gallery, perhaps built on the occasion of a naval victory, had a sunken floor designed to receive a warship as a votive gift. The building contained an *adyton* with an altar, and was preceded by a tetrastyle Doric propylon. To this category of porticoes may be assigned another Delian construction, the so-called "hypostyle hall" (ca. 210 B.C.; FIG. 298), a large building, rectangular in plan, which served as a meeting place and trading center for merchants. The building is open only on the long southern side and is filled almost entirely by two concentric peristyles that supported a clerestory and a slanting roof. Some scholars derive the design of the hypostyle hall from classical Greek buildings (the Telesterion of Eleusis, the Odeion of Perikles in Athens), while others view it as an Alexandrian form, related to the Egyptian hypostyle hall tradition. The Delos building is thought to foreshadow, however modestly and tentatively, the fully developed basilica with entrance façade on one of the long sides, which was to undergo a profound transformation in Roman architecture from the 2d century until the age of Caesar, becoming amplified into the harmonious grandeur seen in the elevation of the basilicas of Porcia (184 B.C.), Fulvia-Emilia (179), Sempronia (170), Opimia (121), and Julia (46). Another type of basilica, of which there is a very interesting example in Pompeii, is the basilica with the forum entrance, in the form of a colonnaded portico with five passages, in one of the short sides of the building (FIG. 396). Linked to

Delos, hypostyle hall, reconstruction of the plan and section (*from Lawrence*).

different traditions from those of the Delos building, the Pompeian basilica, which was roofed — not hypaethral, as was once thought — consists of a large rectangular hall divided into three aisles by a peristyle of 28 Corinthian columns. In the center of the wall opposite the entrance was the podium from which justice was administered. The building itself, which served as a

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

meeting place for public affairs, was built in the second half of the 2d century; the portico in front of the building, the chalcidicum, may be earlier.

It has long been believed that the Italic and Roman basilica may be Greek in origin. The basilica with entrance on one of the long sides has a precedent in the hypostyle hall of Delos (FIG. 298), and the Pompeian type has a precedent in the much earlier two-aisled building in Thera; there is also the evidence of the term "basilica," which is thought to derive from the Stoa Basilike (or Basileios) in the Agora of Athens, a building whose function as judicial seat of the archon is parallel to one of the functions of the Italic basilica. Another, more valid etymology links the name "basilica" to the royal porticoes of eastern Hellenistic cities, structures that may have influenced Italian architecture either directly or through the Greek colonies in southern Italy. In any case, it should be emphasized that the basilica of Pompeii is not only the earliest example of this type of building but is an architectural manifestation wholly Hellenistic in taste, proportion, and in all details of its elevation.

A type of structure that because of its growing importance must have assumed new forms in the Hellenistic age is the public library (Alexandria, Pergamon, Antioch, Pella, etc.). Of the earliest and most important example, the Library of Alexandria, erected by Ptolemy Soter (323–285), only limited information has survived. Strabo (xviii, 1) tells us that the Mouseion, which contained the Library, had a room for banquets, an exedra, porticoes, and streets; we have no way of determining which of the elements constituting the building, or complex of buildings, made up the actual Library. Another celebrated Hellenistic example, the Library of Pergamon, is better known. Modest in size, and thus not likely to have been modeled on the Library of Alexandria, the Library of Pergamon was a rectangular structure with three small rooms and a large hall of honor, which contained a podium around its walls, perhaps for statues, and a prominent pedestal for a copy of the *Athena Parthenos* of Phidias (III, PL. 385). Faced with such a scarcity of original material, this field of research must turn to the more numerous surviving libraries of the Roman age to determine the extent to which these preserve features of their Hellenistic predecessors.

*e. Theaters and meeting halls.* Among the most important of the theaters dating originally from the Hellenistic age are those of Priene (FIG. 299), Delos, Ephesos (FIG. 299), Segesta (FIG. 301), Acre, and Tyndaris (3d cent.); Delphi, Oropos, Pergamon (PL. 148), Teos, Thasos, and Pompeii (2d cent.); Termessos and Pompeii (small theater, 1st cent. B.C.). Earlier theaters that were remodeled in this period include those of Athens, Eretria, Epidauros (III, PL. 340), Tegea, and Syracuse (PL. 55). The general changes made in the Hellenistic age are best observed in the Theater of Priene and the large theater of Pompeii.

The transformation from the classic to the Hellenistic theater involved gradual changes in the orchestra, the cavea, and, most notably, in the structure of the *skene*, changes that were bound up with new trends in the drama. With the decline of tragedy and the rise of the New Comedy, the role of the chorus was sharply curtailed, and the orchestra, which had been the fulcrum of the ancient theater, diminished in favor of the stage building, affording the actors a suitable raised platform (*logeion*, *pulpitum*) on which to perform the play. The alterations of the cavea and orchestra created a variety of new functional and spatial relationships between them and the elements of the skene, owing in part to the introduction of the *logeion*. The variations in the skene, of greater interest, took place in three steps: between about 310 and 300 B.C., movable *proskenia* of wood were introduced in theaters of the old type; in the second phase, from about 250 on, newly constructed theaters were provided with a permanent wooden proskenion with a low colonnade; finally, after about 200, masonry took the place of wood wherever the terrain allowed such a change. In Pergamon, Megalopolis, and Sparta, the portable wooden skene was retained, the sections being stored in *skenothekai* between performances. Once the dramatic action was transferred to the logeion, that is, to the roof of the proskenion, the skene structure acquired the function of a background for the stage set, which was erected on a second level, the *episkenion*. (The opinion of Dörpfeld, that after the introduction of the proskenion plays were acted in the orchestra, thus making the proskenion the background of the performance, is no longer generally accepted; see Bieber, 1939.) The episkenion, it is thought, may also have passed through a wooden phase before reaching its final form in masonry. The proskenion presented a rectilinear front of piers, columns, or half columns joined to piers, which were generally of the Doric order. Some of the intercolumniations (one or three) were reserved for passage between the orchestra and the skene structure, while the others were filled with painted wood paneling. The front of the episkenion presented a varying number of large openings, from three (Priene) or five (Oropos) to seven (Ephesos), often closed by movable painted scenery (*thyromata*). The principal types of skene that should be noted here are the so-called "paraskenion," or western, type in which

Hellenistic theaters: (*a*) Priene, plan (*from Wiegand-Schrader*); (*b*) *Ephesos*, completed plan (*from Lawrence*).

the lateral projecting masses of the skene of the older theaters are retained and the logeion is inserted between them (Thera, Pompeii, Segesta); the ramp, or continental, type, in which the logeion is accessible from the orchestra by means of two ramps placed at the far ends along the line of the skene structure (Epidauros); the eastern type, in which the skene has a straight wall, a prolonged paraskenion, without lateral closing sections, in some cases extending to the sides of the skene structure, in other cases surrounding it completely (Priene, Delos); and the type in which the proskenion has the true colonnade of the advanced Hellenistic (Thasos, Piraeus, Thera, Magnesia ad Maeandrum).

In a comparison of the Hellenistic theater with the Roman, the main characteristics of the latter that emerge are the following: (1) in most cases the cavea did not rest on a natural slope but was supported by a system of arcades and was enclosed in an external ring; (2) the Roman cavea was not in the form of a horseshoe but of a semicircle; (3) the parodoi dividing the cavea from the skene were no longer open walks but were vaulted passageways beneath the extensions of the cavea and served to join into one unit the two parts of the theater, cavea and skene; (4) the logeion of the skene was lower and deeper; (5) the front of the skene was sumptuously decorated with columns (often of more than one order), niches, and statues, and was generally provided with five doors. According to some views, this Roman type of theater was directly derived from that of Greece; others find it a new architectural expression. There can now be no doubt that the Roman theater, like other expressions of Roman art, is in the line of descent from Hellenistic forms. The written tradition informs us that the first permanent theater in Rome, erected by Pompey in 55 B.C., was modeled on the theater of Mytilene, and the testimony of Plutarch on this point (*Life of Pompey*, xlii, 8, 9) is so explicit and detailed that we cannot but accept it. With some variations, the Roman theater is composed essentially of the same elements as the Hellenistic theater. The principle of containing the cavea within an external architectural structure had frequently been embodied in Greek bouleteria and odeia (Athens, Miletos, Pergamon). We find it a little after 80 B.C. in Pompeii, in the small theater, a covered odeion, which also incorporates the system of covered paradoi. The columned *frons scaenae* can be said to have advanced beyond the embryonic phase in the architectural façade that the Hellenistic theater achieved with the introduction of the episkenion and proskenion with columns, false columns, and doors. The union of cavea and skene was the end result of the process of *rapprochement* of the two elements that began with the changed function of the orchestra. It is important to note that in Pompeii in the republican period there were two theaters, a large one as well as the

Segesta, theater, reconstruction of the skene (*from H. Bulle, Untersuchungen an Griechischen Theatern, Munich, 1928, pl. 25*).

small one just mentioned, both of which had, among their typical Hellenistic features, elements that were to be characteristic of the Roman theater. In the large theater, constructed about 200 B.C., a skene having slanting paraskenoi like those at Segesta (FIG. 301) was succeeded, toward the middle of the 1st century, by a rectilinear skene with five openings and a logeion of the Hellenistic type; and in the Augustan age there followed the most radical transformation in the "Roman" direction, the lowering and widening of the logeion and the creation of a proskenion with curvilinear and rectangular niches. The presence of a portico behind the skene (Rome, Theater of Pompey) is further evidence of the continuous evolution of the Roman theater from the Hellenistic type.

In the late Hellenistic age there began the construction in permanent form of another type of building for spectacles, one

Miletos, Bouleterion, completed plan (*from Robertson*).

originating exclusively in the Italic environment — the amphitheater, a huge elliptical structure with stepped seats, intended for gladiatorial and wild-animal combats. The earliest surviving example, in Pompeii, dates from shortly after 80 B.C. and represents the type that rests on an embankment; later this Pompeian example was to be flanked by another amphitheater, built completely of masonry.

*f. Halls for popular assemblies* (*bouleteria, ekklesiasteria*). Structures designed to house popular assemblies are known in many localities of the Hellenistic world (Notion, Assos, Priene, Thasos, Miletos, Messene). Priene and, most notably, Miletos offer outstanding examples. The Ekklesiasterion of Priene has the form of a small rectangular theater enclosed by a surrounding wall and is roofed (3d cent. B.C.). The more complex and unusual Bouleterion of Miletos (FIG. 302) is later, having been built by Antiochos IV Epiphanes (who had donated its like to Antioch). It was a spacious rectangular structure comprising a Corinthian propylon, a large rectangular court with a Doric portico on three sides, and fronted by a two-story façade, the main part of the building, in which was enclosed the meeting hall, with stepped seats arranged in a semicircle and a ceiling supported by four Ionic columns. This structure, thought by some to be one of the more important achievements of Hellenistic architecture and a milestone in the history of European architecture, is belittled by others as a hybrid, an infelicitous compromise between exterior and interior arrived at by fitting a curvilinear into a rectilinear form. It seems fair to acknowledge a certain conflict between the conception of the ground plan, dominated by the principle of axiality (propylon, portico, cavea), and that of the elevation, in which the main part of the building is unexpectedly disposed according to an axis transverse to that of the monumental complex. Nonetheless the Bouleterion has a crystalline harmony of proportion, an exquisitely Greek and Hellenistic grace; it is an interesting example of correlation between internal structure and external façade.

A type of construction that seems to have spread particularly in the late Hellenistic period was the guild building for businessmen, who met to pursue their calling in fixed commercial centers. Such, for example, were the agora of the Italians (or Hermiasts) and the agora of the Poseidoniasts, both in Delos. The first, erected about 130 B.C. by the guild of Italian merchants in Delos, who had Hermes as their patron, was a quadrilateral approxi-

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

mately 3,900 by 2,730 ft. with a central peristyle court. Within, it had a series of exedrae, while outside there stood rows of shops. The agora of the Poseidoniasts, built in 110 B.C. by the Syrian merchants of Berytos (mod. Beirut), who had Poseidon as their patron, was of more modest proportions; it also had a central, Doric peristyle with rooms for various purposes (storage rooms, meeting halls) and a sacred enclosure with four chapels dedicated to Greco-Syrian divinities and to the goddess Roma.

*g. Palaestrae, gymnasiums, baths, fountains.* As early as the end of the 4th century, and throughout the Hellenistic age, the structures designed for the physical education of the young — the gymnasium and the palaestra — had a distinct character. The gymnasium, properly speaking, was an open place where young men exercised, particularly in wrestling and jumping, as well as with the javelin, while the palaestra consisted of enclosed rooms for wrestling, boxing, and the pankration. Often the palaestra was considered an annex of the gymnasium, sometimes even identified with it. Palaestrae and gymnasiums of the Hellenistic age are known from examples in Priene, Eretria, Miletos, Pergamon, Pompeii, Olympia, Delos, Epidauros, and other sites. Generally they consisted of a wide interior peristyle, about which were distributed various rooms such as exercise halls and porticoes for entertainment and dressing. Noteworthy are the palaestrae of Olympia (end of 3d cent. B.C.), which follow Vitruvian specifications (*De architectura*, v, 11), and of Epidauros, the gymnasiums of Priene and Miletos (the plan of the latter recalling, in concept, the Bouleterion), and the unusual triple gymnasium in Pergamon, extended on successive terraces of the middle city with individual sections for boys, for youths from eighteen to twenty years, and for adults. In Pompeii both the Doric-porticoed Samnite Palaestra, to the north of the large theater, and the important complex of the Stabian Baths and adjacent palaestra belong to the Hellenistic period. The latter structure, which goes back to the first half of the 2d century B.C., but which only in the course of the 2d and 1st centuries took on the various elements that were to become canonical in the great baths of the Roman Imperial age, presents, in a very advanced stage, that union of palaestra and bath establishment which in the Greek world was only timidly broached. The public bath is a type meagerly documented in the Hellenistic art of the eastern Mediterranean: Kolophon, Athens, Gortyna, Taposiris (?), near Alexandria, and Oiniadai, in Acarnania. The most interesting, the baths in Oiniadai, which date from the 2d century B.C., show the three principal elements of the Roman bath — frigidarium, tepidarium, calidarium.

As a structure in its own right the public fountain assumed richer and more varied forms in the Hellenistic age. The simpler and more traditional type had a surrounding wall on three sides and a colonnade at the front with a second, interior row of columns or piers (Pergamon, Ialysos, Sikyon, Cyrene); the usual architectural order was Doric. The fountain house of Miletos, dedicated by a Queen Laodike — probably the wife of Antiochos II Theos (reigned 261–247 B.C.) — is of the Corinthian order with a double row of columns. In the fountain of Ephesos, of the simpler type, a large rectangular niche with two columns between the *antae*, and in the fountain in the agora of Magnesia ad Maeandrum, which had twin rows of columns and a blind arch rising on the back wall, the Ionic order was used. But the Hellenistic age certainly was also familiar with the more ornamental type of nymphaeum (often conceived as the architectural façade of a natural grotto consecrated to the nymphs) which was to be so favored in the Roman age, both in the East and in the West. We have an account from the very threshold of the Hellenistic age of a nymphaeum with porticoes before a grotto of stalactites at Mieza, in Macedonia, to which Aristotle customarily took his pupil Alexander (Plutarch, *Life of Alexander*, vii, 3). According to the evidence of a papyrus of the time, the type of fountain with rectilinear front elevation was supplanted as early as the 3d century B.C. in the Alexandrian area by the type with an apse, featuring polychrome materials and colonnaded exedrae with statues between the columns. Given the present state of knowledge of Hellenistic architecture in the East (Syria, Pisidia, Pamphilia, Ionia), it is impossible to establish whether, or to what extent, the imposing nymphaea of the Roman age in these areas, with their *mouvementé* façades enriched by columns, niches, and sculptures, may have developed from earlier Hellenistic examples of similar baroque taste.

*h. The lighthouse of Alexandria and the clock tower of Andronikos.* The construction of that great public monument, the lighthouse on the little island of Pharos at the entrance to the port of Alexandria, must have been completed by the beginning of the 3d century B.C. Of colossal proportions (over 440 ft. in height), this work, which remained standing throughout antiquity and into the Middle Ages — inspiring not only other lighthouses of the ancient world but also certain aspects of funerary architecture (tower of Taposiris etc.) and even, it is thought, the Islamic minaret — is known only through coins, a Roman glass from Begram, and medieval drawings. The Pharos, as it came to be known, was regarded by the ancients as one of the Seven Wonders of the World. The work of the architect Sosistratos of Knidos, it consisted, almost certainly, of a cubical base, an intermediate octagonal part, and a cylindrical upper part decorated with figures of Tritons and crowned with a colossal statue of Poseidon (or of Ptolemy I Soter).

Another unusual public edifice is the water-clock tower (the so-called "Tower of the Winds"), erected in Athens in the middle of the 1st century B.C. by Andronikos of Kyrrhos (Andronicus Cyrrhestes). An octagonal structure with conical roof, it has representations of the winds, in relief, decorating the exterior of the upper part (PL. 149).

*i. Houses.* The study of Hellenistic dwellings is based mainly on the well-known groups of houses in Priene (FIG. 304), Delos (FIG. 305), and Pompeii (FIG. 402), on the large single, noble or royal dwellings in Pergamon, Palatitsa, Ptolemaïs, Nippur, and Arak el-Emir, and on a description by Vitruvius (vi, 7) of Greek houses of the late Hellenistic period. To these may be added, because of their special form, the noble dwellings

Priene, plans indicating the successive developments of the house: (*a*) Plan of 4th–3d cent. B.C.; (b) plan probably of 2d cent. B.C. (*from Lawrence*).

or villas of the Pompeian countryside in their earliest phase. Missing from our documentation, and the lacuna is particularly serious, are the royal residences in the two great capitals of the kingdoms of the Diadochi, Alexandria and Antioch, which must have been especially large and sumptuous structures.

In the 3d century the Priene house (FIG. 304) was built on the earliest, simplest, and most traditional plan; it belongs to what is known as the "megaron" type. The nucleus consists of a hall with vestible *in antis* opening on an uncovered court; a long lateral corridor affords access to the outside, and there are a number of smaller rooms. In some houses the beginning of the transition from court to peristyle can be recognized. In one case the fusion of two adjacent houses created a more complex type of dwelling than usual, with double court. This transformation (2d cent.) seems to have come about through the influence of the later Hellenistic style, which, according to Vitruvius, favored precisely such houses with double courts. The Delian houses (FIG. 305), for the most part of the 2d century B.C.,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

represent, on the other hand, the adoption and development of a type of dwelling with a central nucleus in a peristyle about which the various rooms are distributed and to which access is gained through a corridor. Sometimes an upper story is added to the first story, either as part of the same dwelling, with access by interior entrance staircase and with a gallery around the peristyle; in other cases the second story is added as an independent dwelling with separate staircase. Among the Delian houses note should be taken of the House of the Hill and the House of the Masks. The first repeats in its simple clear plan, with one

Delos, plans of houses: (*a*) Triclinium; (*b*) court; (*c*) bath; (*d*) shop; (*e*) altar (*from Lawrence*).

of the wings of the very wide portico extending the whole length of the building, the type of 4th-century house with *pastas* known at Olynthos. It had an upper story with gallery running round the peristyle and rooms perhaps treated similarly to the lower floors, decorated in the style designated Pompeian Style I. The House of the Masks, on the other hand, presents a more complex type of dwelling in which it is possible to discern the late Hellenistic house as described by Vitruvius, with a part reserved for men, another reserved for women, a section intended for guests, and comfortable living quarters (large dining room, library, art gallery, etc.).

The monumental subterranean tombs of Alexandria, surely reflecting contemporaneous types of dwellings, repeat either the megaron (or *oikos*) or the peristyle plan. The royal palaces discovered on the Acropolis of Pergamon were large houses of the peristyle type, unusually modest, notwithstanding the elegance of the decoration. Houses of the Delian type with peristyle have also been found at Dura-Europos, Olbia, Sidon, Saint-Rémy-de-Provence (anc. Glanum, France), and elsewhere. The remains of a palace of the 4th century B.C. at Palatitsa, in Macedonia, show a deep vestibule and a wide peristyle surrounded by various rooms decorated in part by mosaics. At Ptolemaïs, in Cyrenaica, there is a large palace thought to have been erected for the local representative of the Egyptian monarch. The original structure seems to go back to the 3d century B.C.; the remains are dated 2d–1st century B.C. by one authority (G. Pesce, 1950), but others, though recognizing Hellenistic-Alexandrian traditions in the palace, advance its date to the 1st century of our era. The palace has a narrow and elongated rectangular plan consisting of an axially disposed succession of a great columned hall, a spacious peristyle, and a grand dining hall. Numerous other rooms are distributed at the sides. The plan recalls certain Alexandrian hypogea, as well as the Flavian palace on the Palatine and a building of the Roman period excavated in Jericho; in all these, reflections of Alexandrian architectural types can be seen. In the northern part of the Ptolemaïs palace there were quarters, including an atrium with peristyle, intended for the superintendent of the palace and the service personnel. The palace also had an upper story. While the proposed reconstruction of the southern façade of the peristyle, which has a central part (a wide opening and an upper story) raised above the two wings with double-ordered porticoes, is still in the better-known traditions of Hellenistic architecture, the proposed reconstruction of the northern side presents an aspect of baroque magnificence that seems to anticipate much later forms. Above the Corinthian colonnade and rich entablature with its spiral frieze runs a crowning element, purely decorative, with three strongly projecting niches — the two lateral ones with triangular pediments, and the central one with mixed (curvilinear and straight) pediments — situated between Corinthian columns on pedestals built out from the wall, and with unusual half-moon acroteria. If the proposed reconstructions are reliable, and if these architectural forms are Hellenistic and not later modifications (as has been suspected), the palace at Ptolemaïs reveals baroque architectural tendencies and tastes at variance with much of Hellenistic architecture as it is now understood. Since many certain indications point to Alexandria as the source of the architecture of Ptolemaïs, the question arises whether the vanished architecture of the former city may not have realized forms in a baroque style as yet unknown. It is significant that the judgment "baroque" is also applied to some of the architecture of the strongly Alexandria-influenced city of Petra, which gives evidence of tastes and tendencies similar to those seen in Ptolemaïs and which some scholars, rejecting the attribution to the 2d century of our era, regard as an expression of the Hellenistic period.

There are a few examples that give us an idea of the dwellings of the Hellenistic East. At Nippur, in Mesopotamia, there is a building that demonstrates interestingly the Hellenistic influence affecting a local type of house, with megaron and peristyle and Doric columns of elliptical section. The palace of Hyrkonos at Arak el-Emir (anc. Tyros), Syria, of about 180 B.C., shows a similar fusion of Greek and Eastern elements, though it is on a different plan. In its façade, the high crowning frieze with seriated animals in the Babylonian style is combined with graceful Greek elements (portico with pseudo-Corinthian columns and Doric entablature, surmounted by a similar small portico; pseudo-Corinthian corner piers). The presence in Dura-Europos of peristyle houses of the Delian type has already been pointed out. Houses of the 2d century of our era in Palmyra reveal, in the great clarity and organicity of their plans, a similar derivation.

Perhaps the finest examples of the Hellenistic dwelling are to be found in Hellenized Campania. The houses of Pom-

Alexandria, necropolis of Mustafa Pasha, Tomb 3. Tentative reconstruction of the Doric façade, elevation and plan (*from A. Adriani, Annuaire du Musée gréco-romain, 1933–35, fig. 26*).

peii and Herculaneum, after the earliest phase, in which they were of the simple, severe type of Italic dwelling with atrium, became at a certain stage (and substantially remained) profoundly Hellenized. If the primitive nucleus of the atrium with tablinum was retained, more or less, the house was enlarged and enhanced

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

by peristyles, exedrae, *oikoi*, gardens, and fountains — as well as being enriched in the Greek style of decoration with wall paintings, mosaics, statues, and in many cases, luxurious furnishings. An interesting illustration of Hellenistic influences overlapping and being fused with the forms of the earlier house with atrium is afforded by the houses to which a graceful upper gallery (sometimes false, sometimes real) with little columns and transennae has been added (the Samnite House in Herculaneum, end of 2d cent. B.C.). Of the houses of Hellenistic Pompeii (House of the Citharist; houses of Epidius Rufus, of Pansa, of the Silver Wedding, etc.) the finest example is the House of the Faun (PL. 200; FIG. 402), which occupies an entire insula (block) and is composed of two atria (one Tuscan and one tetrastyle), two peristyles, dining rooms, a splendid exedra, formerly adorned with the great mosaic of the Battle of Alexander (PLS. 154, 155), cubicula, and smaller rooms. In one stage the house had excellent decorations in Style I, but its magnificent original decoration was of the finest mosaics, apparently imported from some eastern Hellenistic center, perhaps Alexandria (see below, *Painting*).

Among the villas of the Campanian countryside going back in the original structure to the advanced or late Hellenistic period, mention should be made of the Villa of the Papyri near Herculaneum and the Villa of the Mysteries (Villa Item) in Pompeii. The former comprised living quarters of the peristyle type and a very long peristyle with pool, garden, and covered walk. With its matchless wealth of decorative sculpture, largely in bronze, and its small library containing the works of Greek philosophers in papyrus rolls, this house (1st cent. B.C. and perhaps earlier) bears witness to the marked Hellenization of Italic culture at the end of the republican age. The Villa of the Mysteries, which in its first phase goes back to the middle of the 2d century B.C., appears as a massive rectangular block with the principal rooms aligned along a central axis. A columned portico with a central exedra — later replaced by a *viridarium*, or garden of potted plants — enclosed the rear part of the building on three sides. As early as the 1st century B.C., the villa underwent modification and was adorned with fine Style II decoration incorporating the celebrated Dionysian *megalographia* (see below, *Painting*). It is certain that the villa type of construction was widespread and developed brilliantly in the Roman world between the 2d and the 1st century; like the house of the ordinary citizen, it may have been strongly influenced by Greco-Hellenistic models which unfortunately remain virtually unknown. Of one architect who built villas in Campania in the 1st century B.C. — a Greek named Diphilos — we have an account in Cicero (*Ad Quintum fratrem*, III, i, ii 3, ix 7).

*j. Commemorative and funerary monuments.* In addition to ordinary graves marked by steles or small monuments, there were many types of tombs, collective and individual, of a monumental character: the hypogeum with tumulus, often with beds and funerary furnishings (Macedonia, Thrace, Euboea, southern Russia, Asia Minor, North Africa); the more complicated hypogeum with court, peristyle (or pseudo-peristyle), and several burial chambers (Alexandria, Palestine, Cyprus, southern Italy); tombs in the form of a small temple (Assos, Delphi, Cambazlı in Cilicia, Oratory of Phalaris at Agrigentum); the heroön, a building for the cult of the heroized dead, erected over a hypogeum room (Kalydon, Kos, perhaps Alexandria); the mausoleum, a type of monumental sepulcher with a high masonry structure supporting one or more stories, with columns, entablatures, real and false doors, and sometimes sculptured decoration (Belevi, Mylasa, Suwaida, Campania, North Africa, tomb of Theron at Agrigentum); the rock-cut tomb with monumental façade (Palestine, Petra, Cyrene). Particular note should be taken of the following: (1) among the tumulus tombs, those having an architectural façade in front of a hypogeum room, with doors, half columns, entablatures, and a pediment (Langaza and Vergina in Macedonia); (2) the previously mentioned group of subterranean Alexandrian tombs with several rooms and open courts, rich interior architectural façades having real and false doors, niches for votive gifts, cult installations, and funeral beds, as well as rich painted decoration; (3) the Heroön of Kalydon (ca. 100 B.C.), the above-ground structure that suggests a palaestra (perhaps for funerary athletic displays), with propylon, Doric peristyle, and various rooms, among them a cult chamber and a crypt (a heroön erected on the Acropolis of Pergamon, perhaps in honor of Attalos I or Eumenes II, had forms that were not dissimilar but no crypt, and hence was only a memorial); (4) the beautiful Mausoleum of Belevi (near Ephesos), perhaps built by Antiochos II Theos of Syria, with a high square-based podium, a *pteron* of 28 Corinthian columns with sculptured decoration in the elements of the roof, and perhaps a pyramidal crowning element; (5) the rock-hewn tombs of Petra (FIG. 308) in Arabia Nabataea, particularly those known as "el-Khazna" ("the treasury") and "el-Dair" ("the monastery"), with superimposed, colonnaded façades in which the motif of the tholos recurs against the background of a portico between two distyle forms with pedimental sections (FIG. 309).

That the chronology of this architecture (late Hellenistic period – 2d cent. of our era) is controversial has been indicated. The possibility of accepting the earlier dating is increased by the unusual similarity between the façades of Petra and the motifs of Style II paintings which reveal — and in definitive chronological terms — a taste for baroque architectural forms. The *mouvementé* architecture of certain Campanian funerary monuments gives evidence of the same taste; for example, "La Conocchia," the Roman tomb near Capua, can be assigned on the basis of technical data to about the middle of the 1st century B.C. (although some date it to the 2d century of our era).

For an expression of Hellenistic taste at its most elegant and sober we turn to a funerary (rather than commemorative) monument in Ephesos consisting of a square podium, a circular body of two colonnaded stories (Doric and Ionic), an attic, and perhaps a stepped pyramidal crowning element. Together with this work, which is attributed to the late Hellenistic period, can be grouped other mausoleums, such as the Mausoleum of the Julii at Saint-Rémy-de-Provence (V, PL. 470), the Trophy of the Alps near Nice, and the Tomb of the Istacidii in Pompeii (1st cent. B.C. – 1st cent. of our era).

The various types of commemorative monuments can only be touched upon here: the large pedestals for statues (monument,

Petra, rock-cut tomb known as "el-Khazna," plan (*from Fyfe*).

later of Agrippa, to the west of the Acropolis in Athens, erected by the Attalids in 178 B.C.; similar monument in the Athenian agora; monuments of Prousias and of Antiochos III of Syria in Delos); simple columns or paired columns for quadrigas and family statues, singly or in groups (Delphi, Olympia: statues of Ptolemy II and Arsinoë II); small exedrae with prostyle façades (exedra of Mithradates VI Eupator in Delos, 102–101 B.C.). A monument of the early Hellenistic age rather than of the classical period, according to some interpretations, was

Petra, rock-cut tomb known as "el-Khazna," façade with restorations (*from Fyfe*).

Delphi's celebrated acanthus column encircled by a group of three dancing maidens, designed to support a tripod.

*k. Cities and city planning.* The prosperity of the Hellenistic world and the politicals vicissitudes that led to the creation of the numerous new centers in the kingdoms of the Diadochi and of the Epigoni gave rise to intense urban activity. The establishment of new Greek cities in the conquered countries, some of them large and splendid metropolises like Antioch and Alexandria, was accompanied by the transformation and occasionally the rebuilding of old cities. Relatively little is known of this extensive city planning activity, however, because many of the more important centers have almost wholly vanished and others — for example, Ephesos, Miletos, Palmyra, Gerasa (mod. Jerash) — are known to us chiefly in their post-Hellenistic development. Nevertheless, it can be said in general that the Hippodamian system of reticulated, checkerboard streets continued to be used, particularly where the conditions of the terrain favored it; that in hilly terrain the method of construction by terracing was often adopted; that in newly built complexes the agora occupied a more conspicuous place and had a more monumental character than in earlier times; and that the system of streets flanked by porticoes came into widespread use.

It is thought, with reason, that in Alexandria the architect Deinokrates evolved a plan of Hippodamian type featuring two wide principal arteries which crossed at right angles; but the character of the various monumental complexes of the metropolis is totally lost to us. The city of Antioch was similarly planned. The Attalid capital, Pergamon, whose upper and middle zones are well known, had a different character. The most important building activity there occurred in the time of Eumenes II (197–159 B.C.). Pergamon presents one of the finest examples of monumental town planning on a mountainous site: the terraces are so arranged that each one virtually forms a monumental complex (FIG. 310).

A fairly complete and well-known example of the Hellenistic city with checkerboard plan is the small city of Priene (FIG. 311), refounded at the end of the 4th century B.C. and in large part built up during the 3d. The city was laid out on a slope at the foot of the rock that formed its acropolis, with a series of terraces, and was enclosed by a handsome masonry wall. The principal street ran the length of the city from east to west, traversing the agora. The agora itself extended into the heart

of the residential area as a rectangular square with Doric porticoes on three sides; in the 2d century the two-aisled Portico of Orophernes was erected to the north of the square and was extended at right angles, forming an eastern portico. Between the Portico of Orophernes and this wing a great plain-arched entrance was erected, one of the rare examples in the Hellenistic period of an arch used for a specifically decorative purpose.

A street system similar to the Priene checkerboard plan has been discovered in the city of Dura-Europos, founded by Seleukos almost at the same time as Priene. Concerning another city of the period, Nicaea in Bithynia, we know from Strabo (xii, 565) that it had a perfectly square plan, so that from its centrally located gymnasium the four gates at the limits of the

city could be seen. With the agoras mentioned above should be listed, as among the most extensive, those of Miletos, Knidos, Kos, Aphrodisia, Magnesia ad Maeandrum, and Ephesos, which underwent change and expansion in the course of the Hellenistic age and after that in the Roman age. Agoras disposed on terraces and having porticoes of more than one floor were, besides the agora of Assos, those of Alinda and Aigai. In Athens the old agora assumed a new aspect in the Hellenistic age, mainly through the addition of the Portico of Attalos II to the east and a complex of other porticoes in the southern part. The assumption by the agora of a monumental character seems to have corresponded to the development of its function, which became predominantly political and civil; in fact, in certain centers — Tralles and Priene, for instance — the need was felt to establish a true marketplace near the civil agora. One of the innovations of the Hellenistic city was the colonnaded street, which seems to have had Eastern origins (Antioch, e.g., had such a feature) but was widely diffused in Greece. The known examples (Ephesos, Olbia, Apamea, Gerasa, Palmyra, Corinth, Kos, etc.) belong to the Roman period, but in most cases they represent the continuation of Hellenistic styles.

In connection with the planning of monumental complexes laid out on terraces, two great sanctuaries must be mentioned here: the sanctuary of Asklepios on the Greek island of Kos, and that of Praeneste in an Italic ambient. The former seems to have been conceived with its system of successive terraces as early as the 3d century B.C. A lower terrace surrounded by porticoes was succeeded by an intermediate terrace containing the earliest sanctuary and a monumental altar and then by a terrace crowning the whole ensemble with its new Doric peripteral temple (200–150 B.C.) enclosed by a colonnaded portico with two flanking wings. Of a different character is the Sanctuary of Fortuna Primigenia at Praeneste (PL. 199; FIG. 399), which belongs to the Sullan age — if it is not of the 2d century B.C., as has also been suggested. This, the greatest achievement of Italic Hellenistic architecture, is among the works that most powerfully affirm its originality and herald the possibility of its ultimate development. Here the terrain has dictated, rather than wide, sloping terraces, narrow overhanging terraces in the lower part and a wider terrace in the upper part, dominated at the center by a high, spacious colonnaded hemicycle. The effect of the whole is that of a magnificent architectural façade with symmetrical elements flanking a central axis. The broad central mass with its colonnades and apertures seems to rise up on an imposing podium with wide surfaces of masonry work left visible at the base. The strongly oblique lines ascending symmetrically toward the center from the extremities of this podium contribute to the sense of rising motion that is implicit in the conception of the whole complex and is accented by the steep stairs at the center, mounting from one terrace to another. While the elements of this sanctuary for the most part manifest a taste that is forthrightly Hellenistic and are consistent with other expressions of the Hellenistic world (Kos, Pergamon, Lindos, etc.), it is also a fact that here the curvilinear element exploiting the new technique of *opus caementicium* (concrete construction) is employed with a command of its esthetic possibilities that is unparalleled in the Greco-Oriental Hellenistic world. Like other, more or less related, important contemporaneous complexes (the Tabularium of the Roman Forum, the buildings of the acropolis of Ferentino, the Temple of Jupiter Anxur at Terracina, the sanctuary of Hercules at Tivoli), the sanctuary of Praeneste, while forming part of the history of Hellenistic architecture, also constitutes an introduction to the history of Roman architecture. In addition to the great complex of Praeneste described above, there was in the lower city another, known as the "lower sanctuary," which comprised three large principal rooms, whose interpretation is debated: the so-called "Antro delle Sorti" ("Cave of Destiny"; perhaps a nymphaeum); the so-called "sacred area" (perhaps a basilica, which may have resembled that of Pompeii); and an apsed room, which may have been at first the seat of the aedile and was later converted into a nymphaeum. The first of these structures was ornamented by a large pavement mosaic representing the bottom of the sea; the pavement of the third was the famous Nile mosaic that once belonged to the Barberini family (see below). The type of nymphaeum found in Praeneste (beginning of 1st cent. B.C.), preceded by the one found at Bovillae (2d cent. B.C.), was to develop and find favor in the Imperial age.

SCULPTURE. *General considerations.* It frequently has been said that the art of the Hellenistic period was no longer purely Greek but the result of a fusion of Greek and foreign, especially Eastern, elements. The truth of the matter is that the profound political changes of the Hellenistic period affected neither culture in general nor art in particular. The birth of the Hellenistic world represented the victory of Greek culture over that of the ancient East. The art that flourished in this period remained unaltered by Alexander the Great's dream of an amalgamation of Greek and Eastern peoples, an amalgamation attempted by some of his early successors; by the gradual decline of the Greek element in the conquered countries; or by the inevitable consequences of contact between the Greeks and the peoples of the East. The essence of Hellenistic art remained Greek, and that art was inherited, assimilated, and transmitted by Roman civilization. Naturally, numerous works were created at this time in an eclectic, Greco-Oriental style, sometimes works of high quality, though very often merely hybrid. Also, representational themes were borrowed from the life and art of subjugated countries. There was an Egyptianizing current, too, within the complex phenomenon of Hellenistic art, and this current created some important works, frequently penetrated the Roman world, and left traces in Coptic art. And the encounter of Hellenistic and Indian ideals resulted in the art

of Gandhara. However, all these were only marginal phenomena, and though often of wide historical and cultural importance, they were always relatively circumscribed in time and place.

It is clear, then, that Greek sculpture of this period was an extraordinarily complicated phenomenon, because of the complexity of the Hellenistic world itself, the length of the period, and the diversity and frequent conflicts of local conditions and traditions. Thus, the historical reconstruction of Hellenistic sculpture presents serious difficulties. Additional problems arise from the fact that the information from surviving literary sources, even though it is supplemented by much epigraphical evidence, is too sparse to help in reconstructing artistic environments and personalities. Graver still are the losses of artistic patrimony. The remarkably extensive and certain knowledge of Pergamene productions is an exception, in view of the devastating losses suffered by the numerous important areas of Hellenistic art. Incomplete exploration of sites and the dearth of scholarship constitute further obstacles.

The interest in Hellenistic art and the effort to evaluate it are fairly recent developments. Until ancient art was studied on a scholarly basis, the Hellenistic age was considered a period of decadence which produced only weary repetitions and exaggerations of the stylistic ideals expressed by classical art. The classicistic taste of the period in which the studies were carried out influenced this judgment, as such a taste had previously influenced the views of Pliny, Vitruvius, and Pausanias. Thus, neither the new values to which Hellenistic art aspired nor the historical importance of this art was admitted. Because the values of Hellenistic art were only lately recognized, Roman art had been credited with several innovations that were, in fact, Hellenistic.

One problem that still faces the scholar approaching Hellenistic art (and sculpture, in particular, for it is the major part of this art) is whether to treat it as a homogeneous whole — a kind of artistic koine corresponding to the linguistic and literary idiom — or as a series of phenomena differing according to centers of production. Actually, Hellenistic art was both unified and diverse, both cosmopolitan and regional. Certain fundamental characteristics are common to all the areas of its vast theater of action, while particular tastes and even special techniques distinguish one center from another. It could not have been otherwise in a world so varied, where attempts to maintain the distinctness of the polis had failed; where artists migrated from center to center; where artistic contacts, because of the increased economic exchange, were becoming more frequent; and where a number of production centers had been created, often very widely separated geographically, culturally, and in those traditions which were to condition the new artistic climate. A study of Hellenistic art ought to delineate as clearly as possible not only fundamental characteristics but also the distinguishing features of the individual centers of production.

The lacunae in the documentation put insurmountable limits to this task, but undoubtedly much can be clarified through critical study of the available data and materials, a project as yet only begun. This article must consider primarily the general aspects of Hellenistic sculpture and limit itself to occasional remarks about individual centers of production.

With the conquests of Alexander and the establishment of the Hellenistic kingdoms, Greece proper and especially Athens ceased to maintain leadership even in the field of art. Artistic production shifted to the new capitals, Antioch, Alexandria, and Pergamon; to the other numerous new cities of Syria, Egypt, and Asia Minor; and to those cities of the Aegean islands (Rhodes, for example) which had retained political importance. The taste for splendor typical of the new courts and the competitive patronage of princes increased the demand for art in the new centers of Greek civilization and encouraged artists to travel. Those of Greece proper crossed the sea, and even those of the Near Eastern towns of Rhodes and Syria moved from center to center. As has been mentioned, the names of many of these artists are known from literary and epigraphical evidence; but the works of few can be identified, and it is not possible to reconstruct the formation or sequence of development of any single personality. Only in some cases, as for example at Athens or Rhodes, can there be reconstruction of successive generations of artists of the same school.

Because of the cosmopolitanism of Hellenistic civilization no personality seems to dominate a specific period of that sculpture. Thus, contrary to the situation in the 5th and 4th centuries, when the evolution of art followed the actions and reactions of a few dominant artistic personalities, sculpture in the Hellenistic period was a complex mixture of currents, directions, and recognizable schools penetrating diverse and distant areas of the world over a period of three centuries.

The coexistence and interaction of various artistic directions and diverse aspects of the same direction were not unusual at this time. The emergence of the baroque did not totally eliminate traditional classicizing tendencies; characteristics which Klein recognized as reactions to the baroque style and defined as rococo are discovered throughout Hellenistic art alongside classical and baroque tendencies. From the strongly centralized compositions which characterize much early Hellenistic sculpture evolved such profoundly diverse works as the standing *Demosthenes*, the "Anzio Girl" (PL. 159), and the *Dionysos* from the monument of Thrasyllos. The dynamic lights and shadows of the Hellenistic age appear as often in highly idealized works (e.g., the Pergamon frieze) as in vividly realistic ones (e.g., the so-called "Zeno" of the Capitoline Mus.; PL. 170). Dating from about 200 B.C. are subtle, aristocratic portraits of spiritual penetration such as those of Antiochos III of Syria (PL. 171) and Arsinoë III in Mantua (Palazzo Ducale) and brutal, realistic portraits with rich and unrestrained plasticity such as that of Euthydemos I of Bactria. The multiplicity of coexisting tastes and directions explains why Hellenistic sculpture may often appear degenerately unoriginal: the variety of its tendencies and forms is in this case reduced to eclecticism. It also explains the difficulty of enclosing the history of that sculpture within a unified framework. Strict and unreserved use of those evolutionary schemes which 20th-century critics have sought to apply to the history of Hellenistic art may lead to a misrepresentation of historical reality, even though the method has been used with great profit (tentatively first by Klein and later by Krahmer, Pfuhl, Horn, and Kleiner).

Before discussing various phases and directions of Hellenistic sculpture, it is necessary to explain why Hellenistic art, especially sculpture, has here been considered an essentially Greek phenomenon and in what way it is distinguished from classical sculpture without being regarded as a hollow degradation of it. It has been noted that Hellenistic civilization must be considered a part of Greek culture and that precedents of the 4th century appear in the former. To many scholars of Greek art the last great master of the 4th century, Lysippos, is the necessary premise to Hellenistic art, if not the first Hellenistic sculptor. Hellenistic art is generally characterized by its departure from the traditional Greek equilibrium that is expressed in classic art in the harmony, the scale, and the idealization of nature (see CLASSIC ART). Was this a sudden rejection of the Greek tradition, or was it a movement along the road opened by the preceding period? There can be no doubt about the answer: the seeds of Hellenistic sculpture were present in the 4th century. It is more to the point to ask whether the change in art from the 5th century to the 4th, that is, between two phases of the classic period, may not have been more decisive than that from the 4th century to the Hellenistic age. The 4th century had already begun to turn from the high idealization of the preceding century toward a naturalism that was to include an attempt to portray emotions. Hellenistic sculpture was to press the grace of the Praxitelean mode to extreme refinement and subtlety, and to nourish its baroque with the pathos of Skopas and the vibrant inner tension of Lysippos. The tenuous passages of the nudes of Praxiteles, the soft modeling of the heads and undulating rhythm in the figures, the lively plasticity of the heads of Skopas, and the spatial involvement of Lysippian figures are the results of the turn of Greek sculpture from its ideals of solid structure, clarity, and simplicity of rhythm. The trend was toward pictorial ideals, more refined and intricate rhythms, and specialized effects which led to more daring forms of pictorialism and a certain complicated rhythm of the figures in Hellenistic sculpture.

In the Scopasian maenad there is a striving for whirling movement, a preference for the figure turning on its own axis, which developed numerous variations in the Hellenistic period. Before that time interest in the colossal is found in the work of Lysippos and his immediate successors; interest in the heroic portrait, which began with the Lysippian portraits of Alexander, was perpetuated in portraits of Hellenistic monarchs. The art of the psychological portrait had begun in the 4th century, especially in the work of Silanion (III, PL. 372). A taste for the ugly, which in Hellenistic art is reflected in a variety of humble subjects of ordinary life and in caricature, had its precedents in 4th-century portraits by Demetrios of Lysimache and Pellichos. In the figure of Mausolos from the Mausoleum of Halikarnassos the coloristic values of light and shadow are alive in the treatment of the drapery and were to become characteristic of Near Eastern sculptural art. However, even though rooted in 4th-century classicism, Hellenistic sculpture had its own many-sided physiognomy and admirably answered to the task of protecting and spreading the Greek artistic ideals in a heterogeneous world.

Among the general characteristics of Hellenistic sculpture is an enrichment of themes. Art continued to serve religion in the creation of cult statues and votive gifts for divinities. The production of architectural sculpture continued with more widespread use of decorative statuary for the adornment of royal and private dwellings. To the votive and architectural functions of relief was added a decorative one; the relief was inserted in the wall as a picture and often depicted bucolic idylls enriched with landscape elements. The most frequently represented divine beings were Dionysos and Aphrodite; the semidivine satyrs, nymphs, Nereids, fauns, Erotes, Psychai, and centaurs were popular, appealing to the contemporary taste for the epigrammatic and the rococo. There was no aspect of the human figure that did not interest the sculptor, and man was portrayed at every stage of life: in infancy, youth, full maturity, and old age. Hellenistic artists often succeeded in capturing the grace of form and freshness of soul of infancy. All social classes were represented; the accentuated taste for realism found suitable subjects in fishermen, peasants, and shepherds, as well as in athletes, orators, philosophers, and priests. An entirely new range of moods was depicted, including tranquillity, pain, serene joy, and open mirth. The last was a Hellenistic innovation — the first attempt to render the laugh and the smile naturalistically. The spread of caricature and the representation of such exotic types as Negroes, Nubians, and Gauls were due to the interest in realism and the search for the novel and unusual (PL. 184). The increasingly popular art of portraiture afforded numerous possibilities, among which were the idealized, heroic portrait and the crudely realistic one, the portrait with fine psychological penetration and the conventional one, the eclectic Greco-Oriental portrait (especially the Greco-Egyptian) and the classicizing one. Sculpture was of a variety of proportions and types, and along with those of colossal and average scale the small ("apartment" sculpture) gained in popularity. Both the isolated figure and the group were created, the latter being not merely juxtaposed figures but a firmly unified artistic vision. Figures sometimes were disposed in landscape. With the beginning of the classicistic trend, group sculpture, like other expressions, returned to ideals once seemingly abandoned. With the interest in naturalism and the demand for "apartment" sculpture, themes of animals became popular. The principal techniques of marble, bronze, and terra cotta continued to be employed (the last was used almost exclusively for production of the small statuettes which found great favor in that epoch). In a few centers there was occasional use of silver, wood, stucco, and marble with a finish of plaster or precious stones; polychromy continued to be employed extensively. Production of funerary reliefs declined, but that of votive pieces continued. Architectural relief did not maintain its high level in the traditional Doric metope and continuous Ionic frieze, but the running friezes of the great altars were of good quality. Three stylistic innovations belong to the Hellenistic period and are traits which Roman relief of the 1st and 2d centuries was to inherit and develop. These are the landscape, the awareness of space, and the continuous narrative (as in the Telephos frieze from the Pergamon altar; PL. 174).

Hellenistic sculpture displays a variety of rhythms, from the sinuosity of the Praxitelean phase to the dynamics of the figure derived from the Lysippian tradition. The rhythms of the vine and the tendril were popular; at one time strongly centralized rhythms were preferred, while later the taste was for open rhythms bursting into space. An interest in observation of nature and an intolerance of restraints often led to the unfortunate abandonment of the equilibrium and solid unity of the nude figure which were inherited from the great masters of the past. Most characteristic were nudes of the Pergamene type, with their contrasting muscular masses; those showing minute anatomical observation (e.g., emaciated old men or athletes); and those with soft, full, uniform masses of flesh, which came to be preferred to the bony type when the ideals of unity and synthesis were renounced. Whenever tradition was rejected, there occurred a destruction of the unity between body and drapery. Hellenistic drapery is generally independent of the figure, no longer enveloping the body to unify the sculptural composition. It is sometimes an agitated mass of deep cavities in shadow contrasting vividly with lighted crests and folds, sometimes a refined pictorial modulation of the surface with the light vibrations of delicate folds. It is a light puff of fabric or a skillful study intended to reveal the drapery beneath a soft mantle of transparent material. At times it is a restrained, regular, and unadorned fall of folds, at times a complicated tangle and overlapping of fabric or a restless twisting of volumes with flamelike rhythms. The degree to which the figure-drapery relationship was apt to be dissolved can be seen in many female statues of early and late Hellenism.

*Phases, directions, and schools.* In the general history of Hellenistic sculpture it is possible to identify with sufficient certainty the phases, directions, and principal schools. The main phases in the evolution of Hellenistic sculpture, defined by the prevailing tastes, can be reduced to three: the so-called "simple style" of early Hellenism, the touching and dynamic style of the middle Hellenistic period (the so-called "baroque"), and the style of the late Hellenistic period characterized by an eclecticism in which, among other directions, a return to classical taste prevailed. The relationships among these three phases were those of action and reaction: as the simple style was a reaction to the feeling for the heroic and dynamic of the late 4th century, so the baroque was a reaction to the simple style, carrying to an extreme the emotional content, spiritual tension, and dynamism previously affirmed in the 4th century. The last phase is, above all, a reaction to the excesses of the baroque, making a tentative return to the equilibrium and moderation of classicism and to certain of its details; but it is also a search for new rhythms and a continuation of and return to baroque expressions, and is thus defined as an eclectic phase with prevalent classicistic reaction.

Other directions of taste also contributed to the general formation of Hellenistic sculpture. These are not the defining characteristics of a particular period but rather were spread along the entire course of Hellenistic art or were transitory and secondary directions. They consist of general predilections for determined themes and representative contents as well as a more precise inclination for stated ideals and stylistic vocabularies. Among these directions are traditionalism, the so-called "rococo," realism, and, on a strictly formal plane, pictorialism and so-called "impressionism"; the color effect of light and shade is the quality of the baroque phase. The traditional tendency initiated by the most faithful followers and closest imitators of the great 4th-century masters continued through the Hellenistic period in the work of artists who clung to the art of the past, preferring the harmonious form and splendid equilibrium of the classical tradition to the severe unadorned expressions of the early Hellenistic period and the exaggerated and ostentatious works of the middle and late periods. Many works of handicraft also belong to the traditional phase.

After the ardent stage of the baroque, traditionalism became vigorous and was expressed in works of varied shapes

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

and sizes, going beyond the search for calmer expression to return to the types and stylistic language of the past (see ANTIQUE REVIVAL) and particularly of the 4th century. Traditionalism became, then, academic classicism (q.v.) and as such passed into Augustan art. To traditional currents are assigned such works as the *Serapis* falsely attributed to Bryaxis, the Niobid group, the group of Muses from Tivoli, many types of nude Aphrodites deriving from the Cnidian *Aphrodite* of Praxiteles (III, PL. 374), many terra cottas and small bronzes, the Naples *Aischines* (Mus. Naz.), the Cyrene *Berenike*, the portrait of Hermarchos, reliefs and funerary steles of Attic type (especially those of Alexandria), many types of satyrs copied in the Roman age, and the *Crouching Aphrodite* of the Vatican Belvedere. These and other works (to be discussed) are from the early and middle phases of the Hellenistic period. Later, traditionalism was to be felt in the forms of the Telephos frieze of the altar of Pergamon, in those of many draped statues and in isolated heads of the same Pergamene origin, in the production of the Attic school (Euboulides, Eukleides, Timarchides, and others), in such portraits as the *Poseidonios* and the *Karneades*, and on into the neo-Attic style and the so-called "school of Pasiteles." A subterranean persistence of traditional currents accounts for the many differences existing among expressions of the new currents. For example, the "Tyche of Antioch" by Eutychides (PL. 157), with strongly centralized rhythms according to the taste of the early Hellenistic period, is still deeply Lysippian in the vivacity of its inner tension and in the complexity of its rhythms; and the *Demosthenes* of Polyeuktos (PL. 160), a manifestation of the predilection for closed rhythms, places itself in clear opposition to the Lysippian past. Of later date is the so-called "Hellenistic ruler" in the Museo Nazionale Romano, characterized by open rhythms of composition and by the negation of structural stability typical of the period (PL. 185). In the heroic conception of the portrait, in the pose, and in certain proportional relationships of head and body, there is visible a return to Lysippos.

The so-called "antique rococo" cannot be considered a period of reaction to the baroque after 170–166 B.C., as claimed by Klein; rather it was the expression of a taste for given themes that penetrated the entire Hellenistic period and continued in the Roman age. Hellenistic rococo shows generally an interest in the playful, in delicate grace, the gentle smile, frank laughter, and in indulgent, epigrammatic suggestiveness which found particularly favorable subjects in the figurative world of nymphs and satyrs, girls and Erotes. This interest had its origins in Praxitelean art; the Hermes who playfully shows a bunch of grapes to the young Dionysos, the Apollo who ensnares a lizard, display the same feeling as the *Invitation to the Dance* and the satyrs of the so-called "Quartet" of the Portico of Octavia. The Pergamene *Symplegma* of Kephisodotos (one of the sons of Praxiteles), vibrant with warm sensuality, certainly dates from the beginning of the spread of the so-called "erotic groups," which were to last throughout the Hellenistic age. A famous example is the satyr and hermaphrodite in Dresden (Skulpturensamml.). The works of this rococo trend assume the most varied styles, because they are expressions of diverse epochs and environments. Some have closed and centralized compositions, as the Castellani *Spinario* (*Boy Removing a Thorn*; Br. Mus.); others have open and centrifugal compositions, as the *Running Boy* of the Prado, or a rich and complex structure, as the Dresden example mentioned above; still others have schematically flattened forms, as the Pan drawing a thorn from the foot of a satyr (PL. 188) and the *Wounded Satyr*, both in the Vatican. This interpretation of the rococo trend (which seems the only acceptable one), along with the Praxitelean paternity recognized in it, establishes a classification that excludes such imposing and powerful works as the "Barberini Faun" (included by Klein) and tends to favor the predilection for a traditionally correct, balanced, and harmonious idiom. In a certain sense the rococo may be considered an aspect of the traditional trend of Hellenistic art. Among the works still to be mentioned are the *Boy* of Boethos (VI, PL. 58), the *Panisca* in the Villa Albani, the *Eros and Psyche*, *Eros in Chains*, the Grimani altar, and the many delightful portrayals of laughing boys and little satyrs frequently found in Hellenistic sculpture. Excluded from this classification are many works included by Klein, who accepted the well-known chronological sequence (the phases of the baroque, rococo, and Roman Imperial styles) of the course of Hellenistic sculpture. Besides the "Barberini Faun" there are the Telephos frieze of the Pergamon altar, the Farnese *Bull*, the *Ariadne Falling Asleep*, and the Borghese *Centaur* in the Louvre.

One tendency present in innumerable examples of Hellenistic sculpture is realism; it, too, descended from precedents in the 4th century to become one of the dominant notes in the art of the new age. This realism assumed the most varied forms and nuances in portraiture, genre, and caricature, eventually descending to trite verism. The trend to pictorialism favored the Praxitelean manner, even carrying to exaggeration the modulation of forms against an uninterrupted transition of planes. Pictorialism was peculiar to the artists of the generations following Praxiteles, and in the course of Hellenistic art it was carried further and often blended with the pathos of Scopasian origin. Manifestations of pictorialism are found in the most distant regions of the ancient world, at Athens and Pergamon, at Priene and Rhodes, at Cyrene, Tarentum, and especially at Alexandria. It was contemporary with expressions of the simple and baroque styles, and its termination cannot be determined. The relief of Archelaos of Priene (Br. Mus.), dated about 125 B.C., shows that pictorialism was still alive in the classicizing period; in the Alexandrian sphere it certainly lasted until the Roman age. Another aspect of Hellenistic pictorialism evolved from another, related tendency in the manner of Praxiteles. This is the so-called "impressionism" of the rapidly rendered form, or sketch, which produced some of the newest and most daring expressions of Hellenistic art. It had a corresponding movement in painting and was particularly widespread in Alexandrian art (the center of "impressionistic" painting), where it produced that great masterpiece, the so-called "Gaul of Giza" (PL. 163). Many works of late Etrusco-Campanian fictile sculpture, of extraordinary strength and freshness of expression, are related to this trend. "Impressionism" arose from a need for liberty, for freedom from dullness, for expressive immediacy unhindered by the restraints of tradition; it has inspired some of the finest works of Hellenistic realism, among which is the "Jockey" of Cape Artemision (PLS. 182, 183). Analogous tendencies produced, especially in middle and late Hellenistic portraiture (PLS. 153, 181), a certain vocabulary of fluid forms, mobile, irregular, often asymmetrical in detail yet possessing clarity in combination, with the use of distortions to create a strong accentuation of the facial expressions (the *Ptolemy VI* in Alexandria, the so-called "Ptolemy VI" in Cyrene, the "Roman" in Cassino, some portraits of the Greco-Egyptian group). The formal originality, the exaggeration and distortion of nature with expressive intent are aspects much less sporadic and circumscribed in time in an Italic, especially an Etruscan, milieu than they are in the Greco-Oriental world. For the critic this poses a problem analogous to that raised by a number of portraits found in Egypt, Delos, and Athens which are singularly akin to certain Roman republican portraits in their crude and meager realism. The problem is whether those forms, contrary to Greek tradition and the traditions of the Greek Hellenistic period, perhaps were subjected to Romano-Italic influence following the political thrust of the Roman world into the East in the 2d century B.C.; or, conversely, whether the Roman portraits themselves are additional examples of Hellenistic influence in Italic areas — works of art formerly considered to be of Italic inspiration but now beginning to be recognized as derivations from the Hellenistic East. What is known of the cultural, and specifically the artistic, relationship between the Hellenistic East and Italic areas would seem to exclude the first hypothesis. The second, on the other hand, is hazardous and unwarranted by the present state of documentation. It is more prudent to view these stylistic analogies as the result of tendencies spread contemporaneously in different parts of the Mediterranean world, rather than the effect of direct influence of one area upon another. This is a special area of study begun comparatively recently. More intensive examination may reveal decided differences between works of art which seem to be related but which may

prove independent more often than first appearances would indicate.

A comprehensive account of Hellenistic sculpture should include mention of the various schools, the centers of production, and the principal characteristics and functions of these. Pergamon and Asia Minor in general, Rhodes, Attica, the Greek mainland, Alexandria, Syria and, in the west, southern Italy and Etruria can be considered the principal and most highly individualized centers. In some cases (Attica and Rhodes in particular) entire genealogies of local artists are known; but it cannot be assumed that truly local schools existed only in such centers. The existence of local schools depended on special environmental conditions and on the formation and perpetuation of certain traditions, rather than on the common nationality of the artists active in a given city. Pergamon, for example, was an extraordinarily unified center of production, despite the varied origins of artists working there. The number of artists (mostly of foreign origin) known in Alexandria is almost insignificant; yet it cannot be denied that a local school existed there with a character of its own and an influence which in some cases even extended beyond the Egyptian area.

*Historical development.* Although Hellenistic sculpture no longer seems so unified as to defy differentiation into successive phases and stylistic trends, its chronology is yet to be agreed upon. A subdivision into short, ten-year cycles (or into the too-numerous centers of production) does not seem justified by sufficiently significant variations of style; the division into three long periods, suggested often in recent years, is more satisfactory. The first period occupied the century from about 330/320 to 230 B.C. and was characterized by a natural prolongation of the old schools of the 4th century, by the new trends of the simple style, and by the first hints and early production of the baroque. The second period began in the age of the great Pergamene donations (230 B.C.) and lasted until the mid-2d century; this was the high point of the baroque, of the pompous and dynamic style which had been superseded by the time when the Telephos frieze of the Pergamon altar was executed (ca. 165–150). The third period was the late Hellenistic, between 165 and 30 B.C., characterized by the decline of the concepts of the preceding period and the growth of the classicizing ideals and eclecticism which were to shape Augustan art.

*a. The traditional currents of the early Hellenistic period.* The written tradition offers a fair amount of information on the followers of the great 4th-century masters, especially on those of Praxiteles and Lysippos, while many anonymous works can be included, because of their style, in the traditions of the old school still effective in the early Hellenistic period. In the late 4th century, between 317 and 307, under Demetrios of Phaleron, Attic art entered a new period of fervid activity. With the increasing political decadence there was a weakening of artistic achievement in Greece and a concomitant emigration of artists to the new centers of the Hellenistic monarchs (e.g., Nikeratos and Phyromakos in Pergamon in the first half of the 3d century). In Athens, however, the new simple style was born, and it produced, especially in portraiture, a number of masterpieces. Spreading beyond Attica, it was to remain apart from the powerful innovating movements of Hellenistic art, the faithful custodian of tradition; as such it was to return to the fore in the classicistic movements of the 2d and 1st centuries B.C.

Kephisodotos and Timarchos (Herodas, *Mimiamboi*, iv, 23; Pausanias, i, 8, 4, and ix, 12, 4) and a certain Papylos are mentioned as pupils of Praxiteles and may have sculptured a Zeus Xenios that was transported to Rome in the collection of C. Asinius Pollio (Pliny, *Naturalis historia*, xxxvi, 34). Kephisodotos and Timarchos often worked together (sculptures of the Asklepieion of Kos, mentioned by Herodas; statues of Enyo for the Temple of Ares at Athens, of Kadmos for Thebes, of Lykourgos and his sons for Athens; the portrait of Menander for the Theater of Dionysos Eleutherios in the same city, etc.). Other works by Kephisodotos alone are mentioned, among which are the previously mentioned *Symplegma* at Pergamon (Pliny, *loc. cit.*, 24) and a group of statues later transported to Rome: an Aphrodite which was part of the collection of Asinius Pollio; a Latona (Leto) on the Palatine; an Asklepios and an Artemis in the Portico of Octavia. Nothing has survived of the works of these two masters who seem to have specialized in portraiture. From what Pliny says of the *Symplegma* of Kephisodotos, this artist appears to have had some of his father's mastery of treating the nude with an extreme sensitivity of surface. A copy of the *Symplegma* by Kephisodotos was formerly recognized in the Dresden satyr and hermaphrodite, which is now attributed to a later age. The signed base of the seated statue of Menander has been found; many believe that the missing head of Menander is to be recognized in numerous Roman copies and reelaborations (busts in Venice, Seminario Patriarcale; Boston, Mus. of Fine Arts). The identification seems likely (though some claim the portrait to be that of Vergil), but it remains a problematical attribution to the sons of Praxiteles, because the nervous style of the portrait, the fine psychological penetration, and the sober formal language place it among the portraits of the last decade rather than at the beginning of the century. Some sculptures from the Asklepieion at Kos have been attributed to the two brothers; among these are a female head and the draped lower part of a female figure (Aphrodite?). These are certainly in the tradition of the Praxitelean school, and the attribution is highly probable, even though certain stylistic qualities might suggest, on first sight, that the sculptures represent a somewhat more advanced phase of Hellenistic art. The sculptural type of the *Latona* of the Palatine by Kephisodotos is on the lines of the *Eirene and Ploutos* (Plutus) by Kephisodotos the Elder (III, PL. 373) and is known from a sculptured base in Sorrento (Mus. Correale di Terranova). Another sculpture (a female torso), found at Kos, is of related type and has been attributed to the two sons of Praxiteles. Relatively little is known of the personalities of the two masters; when Pliny said that Kephisodotos was the heir of the paternal art, he meant that Kephisodotos followed in the steps of his father.

But that the two brothers frequently may have diverged from the path of Praxiteles is suggested by their predilection for portraiture, a type favored by 4th-century currents other than the Praxitelean. If the Sorrento relief preserves traces of the *Latona* of Kephisodotos, the sculptor seems to go back, at least in this work, to sculptural types and traditional rhythms preferred by his ancestral namesake and perhaps even reelaborated by Praxiteles. As has been noted, the teaching of Praxiteles deeply influenced Hellenistic sculpture, both in the general choice of themes and in their formal realization. It was to the Praxitelean ideals that much of Hellenistic sculpture turned, accentuating and modifying them according to the taste of the period, or merely echoing them in a mannerist fashion. The Praxitelean legacy is manifested in numerous works, which must have enjoyed great popularity in view of the number of extant copies and sculptures preserved in the original. Among the most significant of the latter are a very fine head of a girl from Chios, a delicate head of Aphrodite from Athens (both in Boston, Mus. of Fine Arts), a female head (of a divinity?) from Tarentum, a male head of a bearded divinity (Asklepios?) from Alexandria, an ephebos from Knidos (Providence, Rhode Island School of Design), and a statuette of a girl in Cairo (Eg. Mus.). The soft fusion of planes and delicate spiritual expression of the master's style are preserved in all these works, which are dated between the late 4th and mid-3d centuries. In the minor arts the imprint of Praxiteles is often very strong — in the late funerary steles, the small bronzes, and especially in the numerous draped female figurines of terra cotta (*les Praxitèles de vitrine*) which spread from a center of origin on the Greek mainland (Tanagra and Athens), through exportation and the rise of local workshops, to the entire Hellenistic world beginning in the last decade of the 4th century (PL. 194; III, PL. 138; IV, PL. 17). Among the numerous works of close Praxitelean inspiration which exist in copies or reelaborations are various derivations or variants of the Cnidian *Aphrodite*, such as the *Aphrodite* of Munich, the *Aphrodite* of the Dresden-Capitoline type, the Medici *Aphrodite* type (PL. 157), and the Ostia *Aphrodite* (Br. Mus.);

*Aphrodite Anadyomene*; the group of Muses (Vat. Mus.); the so-called "Narcissus" in bronze from Pompeii (Naples, Mus. Naz.); the little satyr leaning on a support and playing on a double flute (Louvre); and the so-called "Psyche of Capua." The Munich *Aphrodite*, of which only the head is known, is the work of a late 4th-century Attic master who recapitulated the various manners of the great artists who preceded him, perhaps Skopas as well as Praxiteles. Still classical in structural balance, it transforms the Praxitelean model with a richer and more varied hair style, an emphasis on spiritual content, and a modeling which lacks the *sfumato* of the master and his successors but which is animated by fine passages of planes. The Medici *Aphrodite* (PL. 157), preserved in 33 copies, is very much in the Hellenistic taste, and, if not by one of the sons of Praxiteles, it is certainly a work of the early 3d century. The memory of the Cnidian *Aphrodite* by this time lingers only in the general type of the nude goddess, but here it is conceived with a sensuality foreign to the original. The attitude toward the nude is entirely different: for the ideal splendor of the Praxitelean nude are substituted the more detailed structure and simpler forms of a naked body. The head, with hair dressed like that of the Munich *Aphrodite*, is modeled with an accentuated pictorial quality and is animated by an expression of studied grace. The motif of the bathing Aphrodite reappears in the Dresden-Capitoline type, a celebrated work preserved in about one hundred copies. While the new type of Cnidian *Aphrodite* has the accessory feature of the towel draped over the vase, the gesture of the arms is identical with that of the Medici *Aphrodite*, Here, however, the figure, slightly bent, has a more closed and contained composition to which the inclination of the head contributes. It is another instance of the nude becoming more "human." The head recalls the Leconfield *Aphrodite* (attributed to the Hermes period of Praxiteles) more than it does the Cnidian, but it is like the Medici and Leconfield types in the effects of *sfumato*. The Capitoline type has been unconvincingly attributed to the 4th century, but more recent opinion places it in the first half of the 2d. The realism of the sensual nude, the elaborate dressing of the hair, and the emphasis on centralized rhythms are in the style of the early Hellenistic era; the opulence and robustness of the forms forecast the *Crouching Aphrodite* of Doidalsas of Bithynia (PLS. 157, 158). The Medici *Aphrodite* seems more delicate and realistic, less a goddess than the Capitoline one, whose studied coquettishness, restless attitude, and irregularities of form seem observed from a real model. If the two works differ in date, it is perhaps the Capitoline which is earlier than the Medici *Aphrodite* and not vice versa, as has been thought by those who believed the former an elaboration of the latter. It is not possible to say where the two Aphrodites were created; it is certain, however, that both are interpretations of a Praxitelean masterpiece in Hellenistic style faithful to the tradition. From the *Apollo Lykeios* of Praxiteles, frequently copied (cf. II, PL. 59), is derived a 3d-century version, which in turn inspired such works as the little *Apollo* of Florence (Uffizi). In this case the copy is adapted to the taste of the new period, drawing upon other 4th-century masters as well: Lysippos for slender proportions, and Timotheos for the general spirit of the head. The *Narcissus* of Pompeii (a Dionysos with no panther skin) revives the idyllic Praxitelean idea of the divinity, a conception that inspired many works of the Hellenistic rococo (of which this is one of the earliest examples). The same rococo spirit permeates the little Louvre statue of the young satyr who plays his flute while leaning on a support. The original model must have been the *Resting Satyr* by Praxiteles.

The attitude of another Praxitelean *Aphrodite*, the seminude goddess of the Arles type, was taken up in the early Hellenistic period. The statue from Ostia in the British Museum appears to represent the goddess contemplating herself in a mirror. Hellenistic traits appear in the accentuated spirit of feminine coquettishness, the slender and restless forms, and the pictorial and detailed drapery. A small statue of Demeter (?) in the Vatican Museums is a Praxitelean female type in the Hellenistic taste, enveloped in one of those silken gowns which were popular in the new age. The fine head, an original (does it belong to the body?), is Praxitelean. Another work in the Praxitelean manner of this period is the original of the "Psyche of Capua" in Naples (Mus. Naz.). The original of a group of Muses descends from the Praxitelean conception of the draped female figure; a number of replicas of these figures remain, the principal sets of which include those of the Vatican, Tivoli, and Madrid (Mus. Arqueológico Nacional). Within the group can be identified two standing Muses (Polyhymnia and Erato of the Vat. Mus.) and five seated Muses — four in the Vatican Museums and one in the Ludovisi Collection (Mus. Naz. Rom.). From this group must certainly be eliminated the so-called "Melpomene," with one leg raised and supported. This figure may be dated to the late Hellenistic period because of its flat composition and unilateral view. The Muses are related to the manner of Praxiteles not only by their general conception and the treatment of the draperies but also by their gentle facial expressions. The exaggerated slimness of the bodies with the belt high up under the breasts (a fashion popular in the Hellenistic period) and an interest in dramatically rich drapery, apparent especially in the seated figures, are far removed from the ideals of the 4th century and suggest a date at the beginning of the 3d. Some of the numerous representations of Aphrodite Anadyomene, who is portrayed emerging from the sea and wringing out her wet hair, are attributed to the traditional trend of this period; the *Anadyomene* of Apelles seems to have been the inspiration for the type (I, PL. 322). It is quite probable that an Aphrodite Anadyomene was created as a cult statue by Alexandrian sculptors in the latter part of the 3d century; the theme remained one of the most frequently used in this area until the appearance of the Rhodian type of crouching Aphrodite in the late Hellenistic period.

All those directions of Hellenistic sculpture which made for strong dramatic and emotional expressions were derived, consciously or not, from the art of Skopas (q.v.). They attained some of their most extreme manifestations in the baroque period, but even in the early Hellenistic period there was much evidence of an uninterrupted tradition descending from Skopas. The sources give no information on a school of Skopas; there is, however, epigraphical testimony in regard to a late descendant of Skopas, Aristandros, son of Skopas of Paros, a restorer of sculpture at Delos toward the end of the 1st century B.C. A "Skopas Minor" signed the base of a *Hercules Olivarius* in Rome in Region XI. That a master with the outstanding personality of Skopas had his followers and successors is a supposition borne out by the monuments. Among the works definitely belonging to this period are a female head from Abukir (Alexandria, Greco-Rom. Mus., no. 22129), a group of Niobids (Uffizi), a funerary group (Alexandria, Greco-Rom. Mus.), the *Pothos* (Desire), a large female head from Tralles (mod. Aydın; İsmir, Arch. Mus.), the *Triton* in the Vatican, and the head of Apollo in the British Museum (no. 1858). In its facial structure and delineation the Alexandrian head has elements which relate it to the Tegean heads of the master (III, PL. 378). The Alexandrian limestone funerary group, a woman and maidservant, attributed to the second half of the 3d century B.C., has the broad, full forms of the body characteristic of the Hellenistic age; but there remains a Scopasian structural solidity in the heads (especially that of the woman). The bust of the Vatican *Triton* (a copy) has a clearly Scopasian character in its nudity and in the passion of the upturned face, but in the treatment of the long, agitated locks it is decidedly Hellenistic. Analogous observations might be made with regard to the colossal head of Dionysos from Asia Minor in Leiden and the *Apollo* in the British Museum. The *Pothos*, generally attributed to Skopas himself, is more likely the work of a later follower (perhaps of the 1st century B.C.) who was also strongly under the influence of Praxiteles. Certainly within the Scopasian tradition is an imposing group representing the slaying of Niobe and her children, which has become widely known through the celebrated group of Niobids in the Uffizi, found in Rome in 1583, and deriving, in whole or in part, from a more ancient original (copies and variants in Rome, Vat. Mus.; Crete, Herakleion Mus.; Oxford; Munich; Dresden; Turin; Geneva; etc.). It has long been thought that these versions derive from the Uffizi group, transported from Seleucia (on the Kalykadnos, or Seleucia Pieria?) to Rome and dedicated by C. Sosius in 32 B.C. in the Temple of Apollo Med-

icus in the Campus Martius in Rome. From what Pliny says (*op. cit.*, xxxvi, 28), even the ancients alternated between Skopas and Praxiteles as the author of these figures. But the works in question are certainly later than the mid-4th century; therefore, it must be admitted either that the testimony of Pliny is not reliable, or that the Uffizi group does not derive from the one recorded by Pliny. It seems that the Uffizi group should be assigned to an eastern school of the second half of the 3d century. (It is sometimes wrongly attributed to the following century.) The imposing conception of the ensemble, which must have been placed in an extensive landscape setting, the theatrical manner which animates all the figures, the fluttering of certain draperies, and the ample forms of the figure of Niobe are baroque in style at a stage preceding that of the first half of the 2d century. The undeniable qualitative differences among the statues have been given too much emphasis recently (Mansuelli); but in certain instances (the mediocre pair of falling Niobids and the poorly executed pair climbing a rock) these differences cannot be overlooked; the figures must be dissociated from the rest of the group and be considered additions by the Roman copyist, perhaps drawn from originals of the 1st century.

The influence of Skopas on Hellenistic portraiture has been recognized only in a general way, that is, in the emphasis on the pathos of the subjects. In this respect the products of the strongly realistic currents of the Hellenistic portrait, as well as the heroic portrait (which, however, more often seems to have been inspired by Lysippos), can be considered under the influence of the teachings of Skopas. But the extant examples of these types of portraits ("pseudo-Seneca," PL. 170; the *Dying Alexander* in the Uffizi; the Homer of the Sanssouci type, etc.) are works of the advanced or late Hellenistic period, in which Scopasian pathos has filtered through the experience of the baroque. The composite, spiral rhythm which characterized the *Raving Maenad* of Skopas reappears often in Hellenistic works; more often, however, these works have been affected by Lysippos. Such is the case of the *Drunken Maenad* who dances while playing the double flute, of which there are several replicas (Berlin, Staat. Mus.; Rome, Mus. Naz. Rom; etc.), all unfortunately without heads; the original is said to date from the early Hellenistic period.

Scopasian pathos rendered with Praxitelean subtlety of form and in a highly romantic tone was characteristic of many works in the course of Hellenistic art (the "Beautiful Head" from Pergamon; the female head from the Serapeion of Alexandria, PL. 178; the *Alexander* at Stuttgart; the female head from Tralles in İzmir). This meeting of stylistic concepts is fully realized in the head of the Aberdeen *Herakles* (Br. Mus.), which, if not the final work of Praxiteles, is from the beginning of the Hellenistic age. A similar fusion of styles occurs in the *Pothos* mentioned above (replica from the Cispian hill, Rome) and in the head of a statuette of an athlete of the 3d century B.C. (formerly, Stroganoff Coll.; now, Met. Mus.). The latter shows Lysippian influence in the proportions of the body and in the complexity of the structure.

Scopasian influence must have made itself felt in Etruria rather early. Traces of it appear even before the emotional baroque heads of the advanced or late Hellenistic period (the urn statues of the Volumnii; terra-cotta heads from Arezzo) in some heads of the "Scasato" temple at Falerii (mod. Civita Castellana; V, PLS. 47, 54) dating from the end of the 4th century and the beginning of the 3d; in a limestone head from Volsinii Novi (mod. Bolsena), in Rome (Mus. Barracco), of somewhat later date; and in numerous small terra-cotta products, among which is a little head formerly in the Barberini Collection and now in the Villa Giulia in Rome.

In contrast to the school of Skopas, more is known about that of Lysippos, which continued on toward the end of the century. The sons of Lysippos — Daippos, Boidas, and Euthykrates — were his pupils, as were Phanis, Eutychides, and Chares of Lindos, among others. In his *Perixyomenos* (Pliny, *loc. cit.*, 87), Daippos must have adopted the motif of his father's *Apoxyomenos*; there may be a trace of it in some of the relief figures on a base in the Acropolis Museum, Athens, dated about 300 B.C. A copy of the *Praying Boy* of Boidas (Pliny, *loc. cit.* 73) is believed to be recognized in the famous bronze in Berlin (III, PL. 403). Less reliable is the identification of the *Epithyousa* of Phanis (Pliny, *loc. cit.*, 80) in the celebrated statue of the "Anzio Girl" (PL. 159). The colossal statue of Tyche which Eutychides executed for Antioch on the Orontes (Pausanias, vi, 26) slightly after 300 B.C. is known through coin representations and some bronze and marble copies in a reduced form (PL. 157). The work is Lysippian in character, but in the strong centralization of the seated figure and in the simplification of the drapery it already has clear elements of the simple style (of which more will be said shortly). A portrait of Seleukos I Nikator of Syria, also Lysippian in concept, is known in an excellent bronze copy from Herculaneum. It should be attributed not to Lysippos, as some have believed, but to one of his younger followers open to the new tendencies of his time, perhaps the portraitist Aristodemos, who, like Lysippos and Bryaxis, is known to have executed a portrait of Seleukos, There are two copies of a portrait of Demetrios Poliorketes (Pliny, *loc. cit.*, 67) by Teisikrates, who evolved from the school of Lysippos through his master Euthykrates; one is a mediocre marble herm, the other a fine bronze statuette in Naples (Mus. Naz.). In the latter the scheme of the figure with a raised foot and the head directed upward revives the heroic Lysippian conception of *Alexander with the Lance*; but in this case there is more than a beginning of the reaction to 4th-century forms — a reaction that sought simpler forms, greater compactness of volume, and unity of surface.

Resemblances between the head of the magnificent *Dancing Satyr* (Rome, Gall. Borghese) and Lysippos' portrait of Socrates (of the type in the Mus. Naz. Rom.) suggest the attribution of the original to a pupil of Lysippos who anticipated the baroque style. As the ancients themselves observed (Plutarch, *Life of Alexander*, 4), the portraits of Alexander executed by Lysippos had a strong influence on those of Alexander's successors. This fact is demonstrated in the many portraits of princes, and of Alexander as well, which appeared throughout the Hellenistic era, and it is especially apparent in the coin series of the Diadochi, which frequently were decorated with the same image of Alexander. The works of more conservative sculptors and more faithful followers of Lysippos are known through bronze or marble copies which often have suggested attribution to the master himself (*Hermes in Repose* and a pair of wrestlers which have been thought to be the *Luctatores* of Aristodemos; Pliny, *loc. cit.* 86; both bronze, from Herculaneum, in Naples, Mus. Naz.). Chares of Lindos executed a colossal bronze statue of Helios for Rhodes, included by the ancients among the Seven Wonders of the World. The work was destroyed in ancient times and is totally unknown today; in subject and magnitude of proportions it must have reflected the colossal bronze quadriga of Helios executed by Lysippos also for Rhodes (Pliny, *loc. cit.*, 63). The so-called "Alexander Sarcophagus" (PLS. 151, 152) from Sidon is ascribed to Euthykrates, a pupil of Lysippos. It is an admirable, original work, perfectly preserved, dating from the last decade of the 4th century, and almost certainly relates, in theme and perhaps in certain compositional schemes, to two great Lysippian groups, the *Hunt of Alexander* at Delphi (Pliny, *loc. cit.*, 64) and the *Battle of Granikos* at Dion (Pliny, *loc. cit.*, 64). The forms of the sarcophagus reveal the influence of Attic sculpture (perhaps Leochares, a collaborator of Lysippos at Delphi), and although it is at the threshold of the Hellenistic period, it is an example of the continuity of the genuine classical tradition.

The sculpture of the early Hellenistic period displays a traditionalism which does not seem to follow any of the lines descending from the major masters of the 4th century. From this traditionalism, besides many types of minor sculpture (votive and funerary reliefs, statuettes, small bronzes, etc.), come such cult statues as the *Serapis* falsely attributed to Bryaxis, a number of portraits among which are those of Aischines and Theophrastos, the so-called bronze "Pythagoras" of Herculaneum, and many others whose classicizing traditionalism could indicate an attribution to the academic currents of the late Hellenistic period rather than the 3d century (for example, the *Homer-Apollonios* of Tyana).

*b. The "simple style."* In the early Hellenistic period the innovating currents which were to produce expressions peculiar

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

to the new age operated alongside the traditional trends. Important among these currents was the one to which 20th-century critics have given such names as the "simple" or "sober style," "closed form," or "centripetal form"; if these are not wholly satisfactory, they at least suggest its essential characteristics. It constituted a reaction against the ideals of content and form that were spread in the 4th century through the activities of the three great masters and transmitted to the Hellenistic period by their followers. The new trend was toward calm and thoughtful expressions, either strongly individualized or generalized like those of ordinary humanity, in opposition to the open representation of spiritual feelings which had prevailed formerly. Compact rhythms and simple compositions replaced the softly sinuous rhythms of Praxiteles and the unstable and dynamic rhythms of Lysippos. For the pictorialism, the rich, plastic form, and the coloristic play of the surface was substituted a dry, sculptural style with a feeling of heaviness; surfaces were wide and smooth or crossed by fairly small folds tending toward linearity. The expression of movement was no longer sought, but one of the formal characteristics of the new trend was the use of strongly centralized rhythms. Facial features were simplified and often incisive; the mass of the hair was reduced in volume and made to adhere to the crown of the skull or was rendered with uniformity in order to preserve the essential simplicity of the whole. The new trend, which was operative during the period of disruption and turbulence in the Mediterranean world that followed that of Alexander, had its epicenter on the Greek mainland, particularly in Attica, where there were precedents for it. It was in Attica in about 280 B.C. that the most mature and representative work of the new style was created: the *Demosthenes* of Polyeuktos (PL. 160); the trend made itself felt outside Greece proper, and its manifestations varied in quality. Careful consideration of the movement reveals that it represented a kind of delayed reaction and return to a severe style, along the paths which the 4th century had opened to the Hellenistic age.

Portraiture appears to have been one of the areas in which the new ideals achieved their finest realization. As has been seen, there are elements of the new style in works by the followers of Lysippos and Praxiteles (the *Demetrios Poliorketes* of Timarchides; the *Seleukos* of Aristodemos; the so-called "Erato" of the group of Muses, Vat. Mus.). An interest in sober draperies is already evident in some female figures of the last Attic steles completed before the decree of Demetrios of Phaleron against funerary luxury. Similarly, in the almost contemporary original of the Castrum Praetorium *Athena* (Rome, Conserv.) the new style is manifested in the strongly unified volumetric conception of the ensemble and in the simple, uniform drapery. Traditional schemes rendered in the sober and severe language of the new currents are found in the *Themis* of Chairestratos (II, PL. 55) and in the seated Dionysos from the monument of Thrasyllos in Athens (Br. Mus.) about a decade later. The statue of a seated girl (PL. 157) evidences a different spirit, being a completely closed composition, with sober drapery and a calm expression. The scheme of the seated figure with crossed legs recalls the "Tyche of Antioch" of Eutychides (PL. 157), but the contained, centralized composition and renunciation of spiritual tension manifest a greater maturity of the new ideals. The *Urania* in Frankfurt (Liebighaus) is closer in conception to the "Tyche" in its unquiet, nervous attitude, the chiaroscuro effects in the drapery, and the traditional wealth of forms, in contrast to the taste of the simple style. The ideal of this style is expressed differently in a work discovered in Asia Minor, the *Nikesos* of Priene (Berlin, Staat. Mus.). The structure is compact, the form is blocklike, and the drapery is treated with corresponding simplicity, despite the finely rendered wrinkled mantle. Epigraphical evidence dates the work to the first half of the 3d century. Similar structural characteristics were to appear a few decades later in a work of inferior quality, the statue of Nikokleia from Knidos, but here the blocky appearance is unevenly and ineffectively achieved.

The closed and compact composition, calm harmony, and sober forms were also applied to the light, playful subjects of the Hellenistic rococo: the boy who pulls a thorn from his foot (Br. Mus., formerly Coll. Castellani); the seated sleeping Eros (Naples, Mus, Naz.; Rome, Gall. Doria Pamphili), sometimes transformed into a fisher-boy (Rome, Villa Albani); the sleeping serving-boy (*lanternarius*, or lantern holder); the boy who laughingly contemplates the bird in his hands (Rome, Gall. Borghese); and the girl with the dove (Munich). The new manner created solid, compact compositions in spiral rhythms (the *Dancing Girl* in Budapest; the satyr who examines his tail, also known in many copies: Mus. Naz. Rom.; Vat. Mus.). In the *Dancing Girl* the harsh outline of the mass is boldly broken, while the little satyr lowers his head, sharply turning it to the rear, and extends his thin limbs in a spiral that suggests a curly lock of hair. The Baker bronze dancer (from Alexandria; Met. Mus.) is similar in attitude to the Budapest dancer but has a less centralized composition and was probably executed a few decades later, toward the end of the 3d century.

The "Anzio Girl" is a fine Hellenistic work (PL. 159), a superb expression of the innovations and creative forces of the era. A temple attendant, a young novice, humble and neglected, contemplates the sacrifical objects deposited on a plate. If it is not an original of the 3d century B.C., it is a fine copy from the early Imperial age. The sculpture has something of the simple style in the closed rhythm of composition, the calm tone, and the heavy fall of drapery folds. But a broad, full treatment is substituted for a meager, dry manner in the nude passages, and the drapery is unusually complex. Despite the solidity of stance and the great volume of the robe, the rhythm has an instability that suggests Lysippian ideals. This sculpture is so boldly new that it may have been conceived in a Near Eastern milieu rather than on the Greek mainland. The work was executed in the period that introduced the new concepts of plastic richness and dynamism that were to lead to the baroque period (between the 3d and 2d centuries) of Hellenistic art.

Another work that represented something new in the development of Greek art is the pair of wrestlers in the Uffizi, from a bronze original of the second half of the 3d century B.C. Although the heads have been restored, elsewhere the Lysippian influence is undeniable. But the work is altogether Hellenistic in the closed composition of the two engaged bodies, meant to be seen from several viewpoints. Two examples of the depictions of those humble subjects (fishermen, shepherds, peasants, etc.), so dear to the taste of the Hellenistic period, can perhaps be dated as early as about 250 B.C., for this type of subject was a continuing favorite and should not be placed only at the end of the era. The first is an old fisherman, reproduced and reelaborated many times by Roman copyists (PL. 336; Louvre, etc.); the second is a small bronze from Neviodunum (Vienna) of an old woman, perhaps an attendant in a temple. The white marble copy of the fisherman in the Vatican Museums (Gall. dei Candelabri) is more faithful to the original than is the basalt and alabaster one in the Louvre, which not only has been greatly restored and reworked but appears to be an elaboration in the minutely realistic style of the late Hellenistic period. The Vatican example harks back to the concepts of the simple style in its frontal construction, its sober treatment of form, and in the fact that — despite its crude realism and the vast difference in subject — the head and upper part of the bust recall the *Demosthenes* of Polyeuktos. The sculpture of the old woman from Neviodunum is in many ways structurally similar to that of the fisherman; the tranquil and compact drapery, tending toward schematization, is a mark of the simple style.

As has been said, portraiture was particularly well adapted for the statement of the stylistic ideals of this new current. The highest and most complete expression that has survived is the *Demosthenes* (PL. 160; principal copies are in Vat. Mus.; Oxford, Ashmolean Mus.; New York, private coll.), whose bronze original, erected in the Agora at Athens about 280 B.C. (Plutarch, *Life of Demosthenes*, XXX, 5) was the work of Polyeuktos. In it appear all the characteristics of the new current: the intense and controlled emotion; the strong structural synthesis which centralizes the compositional lines in the hands; the meager and unadorned treatment of the forms, be they of bare flesh, face, or draperies; and the sharpness of the contour. The portraits most similar to this are a superb head of an old philos-

opher (PL. 161); the *Olympiodoros* (Oslo, Universitetets Oldsaksamling); the head of Zeno the Stoic (Naples, Mus. Naz.); the so-called "Solon," a bronze from Herculaneum; and the *Antiochos I* (Vat. Mus.). Less close to the *Demosthenes* but certainly products of the same current are the granite *Philetairos of Pergamon* (Naples, Mus. Naz.), with its incisive and economic realism; the *Epikouros* of Type A and the noble portrait of Hypereides (both Copenhagen, Ny Carlsberg Glyptotek); and the so-called "Diphilos" in Vienna, in which the surfaces of the face and curls of the hair are treated in a richer and more mobile, perhaps Near Eastern, style. The powerful *Ptolemy Soter* from Egypt (Copenhagen, Ny Carlsberg Glyptotek), of the same period, is animated rather by the bold, spiritual content of Lysippian work than by the interiorization of feeling of the simple style, and the thin firmness of its modeling reflects tendencies found in Alexandrian art. Among numerous other contemporary portraits is the seated statue of Poseidippos in the Vatican Museums. The heavy monumentality, extremely simplified drapery and pose, and bare realism certainly indicate a date in the mid-3d century (precisely the period of the playwright) and not in the classicizing period, as some have suggested. Another seated statue, variously interpreted as a portrait of Aristippos, Zeno, or Kleanthes (a small bronze in Br. Mus., headless copies in Rome, Mus. Barracco; Met. Mus.; and elsewhere), may be dated to the first half of the 3d century by the simplicity of the drapery and the closed composition, though these traits are less emphatic than in the *Poseidippos*.

The pose and composition of works with centralized rhythms, such as that of the seated girl in Rome (PL. 157), are found also in the portrait statues of the period (the headless statue of Kleoboulos Lindios, Rome, Gall. Doria Pamphili; the statue of a philosopher, Rome, Coll. Barberini). This trend in the portraiture of the early Hellenistic period (it is not known whether it developed under Greek influence or in the natural course of local evolution) seems to have found particularly favorable ground in Etruria, where it is represented by fine works which, while accentuating the stereometric conception, preserve a great sobriety and stylization in details and frequently retain the thoughtful and concentrated psychological expression. Representative of an entire type is the superb Capitoline *Brutus*, to which are related such other heads as the bronze said to come from Bovianum Vetus (mod. Boiano) in the Louvre and the head from the sarcophagus of the Magnate of Tarquinia.

*c. The "baroque."* The new cultural and political temper of the times is reflected not in the stylistic ideals of the simple style, but in the "baroque" currents which prevailed from the last decades of the 3d century until the middle of the 2d, and even beyond. The Hellenistic baroque was foreshadowed much earlier: the pathos of Skopas, the dynamism of Lysippos, and the work of their followers constitute the precedents of this style, not only in a general sense but specifically in the taste for large compositions, for restless, imposing forms, and for striking effects obtained through the expression of violent emotions and through coloristic inflections of light and shade; the last was to become, on the formal level, the basic characteristic of the baroque. One can imagine what the imposing sculptures of the 4th century were like: that of Skopas, depicting Poseidon, Thetis, Achilles, Nereids, Tritons, and marine monsters, which was transported to Rome for the Temple of Neptune (Pliny, *Naturalis historia*, xxxvi, 25); the *Hunt of Alexander*, by Lysippos and Leochares, at Delphi (Pliny, *loc. cit.*, 64; Plutarch, *Life of Alexander*, 40); and that of Dion, also by Lysippos, with an episode from the Battle of Granikos (Pliny, *loc. cit.*, 64). One can also imagine the sense of the colossal inspired by certain sculptures of Lysippos and his school. The type of the so-called "Alexander Helios" (Rome, Cap. Mus.) surpasses the "Azara herm" (IX, PL. 224) of Lysippos and the Rondanini *Alexander* (attributed to Leochares) in its emphasis on volumes, on the movement of the hair, and on the heroic expression of the subject. The latter work is an early expression (early 3d cent., if not before) of concepts which were to be important to the art of the end of the 3d century and the first half of the 2d. If the seated statue in Copenhagen (IX, PL. 223) is a copy of the *Socrates* of Lysippos, it presents, in the treatment of the drapery, an anticlassical, agitated rendering of folds which forecasts the convulsive turbulence of baroque drapery. In the statue of Mausolos (III, PL. 378) coloristic values overshadow plastic structure, and the ideals of the classical period are thus superseded. If the portrait of Antisthenes, of which there are several copies (e.g., Rome, Vat. Mus.; Naples, Mus. Naz.), is a work of the 4th century rather than of the 2d, it is another early manifestation of the baroque in its elaborate plasticity. There are more or less decisive anticipations of baroque style in some of the works we have already considered: Niobids, and especially the Niobe figure itself, with its broad and powerful plasticity; the fine head of the Borghese satyr; and the "Anzio Girl." Other examples, however, date from the period between the middle of the 3d century and the time of the great Pergamene donations, or represent the persistence of more moderate baroque forms in the same period. Foremost is the celebrated *Crouching Aphrodite* by Doidalsas of Bithynia, frequently copied and reelaborated by the Romans (the best copies are the one in Rome, Mus. Naz. Rom., PLS. 157, 158, and that in the Louvre); a little later than the "Anzio Girl," it still adheres to the compositional technique of centripetal rhythms. But it is an expression of the new taste as well, in its broad and powerful rendering, in the fullness of the nude body, in the handling of chiaroscuro in the modeling of the heavy, flowing curls and the open mouth, and in the contrast between the full, smooth, lighted surfaces and the shadows which spread over the compact arms, legs, and bust. It seems that there were touches of genuine magniloquence in Doidalsas' *Zeus Stratios* in Astakos, which is known from depictions on coins. The original of the Landolina *Venus* (Syracuse, Mus. Arch. Naz.) is perhaps from the same period as the *Aphrodite* of Doidalsas rather than from the following century. The *Venus* has the marks of the new style in the turbulence of its swelling draperies, in its sensuality, and in the realistic forms of its abundant flesh. The male figure on an Attic stele in Budapest must have been produced between the 4th and 3d centuries, rather than in the late Hellenistic period. The undulating drapery, rich in coloristic effects, could well have been conceived in a period that created such figures as that of Mausolos. The beautiful statue of a bearded philosopher in Delphi cannot be considered as classical nor as an expression of the simple style; there is a feeling for light and shade in treatment of the head draperies and for broad and powerful forms. This statue, executed in the first half of the 3d century, represents a new interpretation of the forms of the traditional iconic type of male statue.

Some representations of warriors (e.g., the so-called "Lysimachos" of Naples, a warrior of the Margham type in London, Br. Mus., and Rome, Conserv.) may have preceded those erected under Attalos I on the Acropolis of Pergamon. The sense of a magnificent epic and dramatic power is expressed with an intensity, a plastic solidity, a simplicity of formal conventions, and often with a compositional concentration which is not to be found in the age of the mature baroque. There is a similar quality in the superb portrait of Attalos I from Pergamon (first version, 240–230 B.C.), in which the closed volumetric synthesis that characterized the portraits of the early Hellenistic period is animated by a sense of pathos and a mobility that mark the baroque style. The luxuriant and agitated corona of hair, which must have been added several decades later, gives the portrait a certain emphasis but destroys the structural compactness, while adding coloristic embellishments. To this first baroque phase belongs the statue of a crouching Scythian, the so-called "Knife Grinder" (PL. 164), which originally must have been part of a sculpture depicting the punishment of Marsyas. Since the other elements of the original sculpture are unknown, it would be hazardous to relate to the "Knife Grinder" a bust of Apollo from Pergamon or the type of Marsyas generally associated with the latter. The "Knife Grinder" is rendered in broad, powerful, and solidly unified forms that evoke dramatic intensity rather than pathos.

The simple magnificence of conception, the sure immediacy of execution, and the potent vitality of expression (notice, in

particular, the head, which is very beautiful, PL. 167) relate the "Knife Grinder" to one of the major creations of Hellenistic art, the original of the "Barberini Faun" (PL. 169), which was almost certainly executed at an earlier stage of the baroque style than were the "Ludovisi Gaul" (PLS. 162, 163) or the sculpture of Menelaos with the body of Patroklos (PL. 162; about 230 B.C.). If the rhythmical, open composition (certain in spite of some question regarding restoration) is like that of late Hellenistic art, this merely emphasizes the originality of the conception but does not relegate the work to a later period, as is often suggested. The evolution of the simple style toward the baroque is shown also by the statue in Copenhagen of the seated lyric poet, the so-called "Pindar." An intensity of thought and a rather schematized drawing of the face (inherited from the portraiture of the first half of the century) are combined with a feeling for power and breadth of form and coloristic enrichment. This suggests that the exceptional portrait statue may have been produced shortly after 250 B.C., rather than at the beginning of the 2d century as has been thought. In the great funerary sculpture of a woman with her maid in Alexandria (previously mentioned) the closed solidity of the composition is rendered with a fullness of form and imposing monumentality indicative of the new trend. Two other examples of this tendency, very different in character from the works hitherto examined, are the bronze bust of Antiochos II Theos from Herculaneum and the *Odysseus* in Venice. In the former the modeling in wide planes, a certain fullness of form in the face, and a decided taste for the imposing manner recall works of the first half of the century (e.g., the "Anzio Girl," the *Aphrodite* of Doidalsas). The dynamism and pathos of the *Odysseus* are controlled by a sense of balance that harks back to earlier ideals.

In the period from about 240 to 160 B.C., the premises of the baroque were carried to the extreme. Toward the end of the period a classicizing reaction began, but the baroque style still made itself felt throughout the entire late Hellenistic period. The evolution of stylistic ideals was marked by an ever-increasing emphasis on impressiveness and effects of impetuous movement, pathos, and plastic richness. Parallel to this there was a weakening of creative force and a progressive lack of concern for structural solidity; about the middle of the 2d century this was to degenerate into certain empty and overemphatic statements and arouse a classicizing reaction. A taste for sculpture that is neither impulsive nor dynamic but vividly coloristic in its lights and shadows and ardent in its search for expressiveness should also be considered a manifestation of the baroque. This taste was to find its vehicle in portraiture and in representations of certain subjects, both of which were rendered with particular attention to naturalistic detail. Contemporary with baroque manifestations were minor trends. One tendency was marked by a tempered coloristic effect and a fine psychological penetration, a genuinely portraitist tendency. Another preferred forms with greater balance and more traditional character than those of the baroque and used certain themes of the rococo and incipient classicism.

This period saw most of the activity of the Pergamene school, which must have occupied a preeminent position in baroque production. Fortunate circumstances of preservation and discovery emphasize the preeminence of this over other centers, especially those of the Near East and the islands, which are less familiar or entirely unknown. Records and archaeological evidence (especially monument bases bearing inscriptions) indicate that artistic activity was already remarkably intense in Pergamon under the first two Attalids, Philetairos (283–263 B.C.) and Eumenes I (263–241 B.C.); but it was perhaps only in the most active period of architectural revival and growth, embracing the eras of Attalos I (241–197 B.C.) and Eumenes II (197–ca. 159 B.C.), that Pergamene art acquired its own distinguishing features. The art of the reign of Eumenes II is the best known, as most of the surviving sculpture can be dated to this period, including the exceptional ensemble of the altar and its precinct (PLS. 172–174; IV, PL. 218). Remains of bases and inscriptions testify to the existence of numerous sculptural groups erected in the precincts of Athena Nikephoros in commemoration of the victories of Attalos I over the Gauls and the armies of Antiochos Hierax. Other votive gifts glorifying victories of the Attalids existed in Delos, on the Acropolis in Athens, and perhaps elsewhere. Pliny (*op. cit.*, xxxiv, 84) gives the names of four artists who portrayed the wars of Attalos I and Eumenes II against the Gauls: Isigonos, Phyromakos, Stratonikos, and Antigonos, the first of whom is identified with the Pergamene Epigonos known from various other sources. There are numerous sculptural representations of fighting Gauls and Greek warriors (almost all in copies) which can be dated with certainty to the baroque period (3d–2d cent. B.C.), but it is impossible to state with equal certainty their relationship to monuments whose existence is known. According to criteria of style (based on significant structural synthesis, greater firmness and sobriety of sculptural idiom, and a carefully controlled sense of drama) the following groups can be distinguished: (1) a group from the beginning of the age of Attalos I and, in some cases, perhaps a decade earlier, including fighters of the Margham type, the head of a Gaul from Delos, the heads of a Persian and a Gaul in Rome (Mus. Naz. Rom.), the head of the "Lysimachos," the torso of a warrior in Rome (Conserv.), and the torso of a warrior from Delos (in Athens); (2) an intermediate group from the last decades of the 3d century (age of Attalos I) represented by the "Ludovisi Gaul" (PLS. 162, 163), the "Dying Gaul" (PL. 164), heads of Gauls in the Vatican, Delos, and the Museo Nazionale Romano, and two heads of combatants in the British Museum; (3) a group from the period of Attalos II, which includes the works of the so-called "Small Donation." Some of the works in the second group have often been assigned to a so-called "Great Donation" of the precincts of Athena. It has been determined that at least three donations were erected there in the time of Attalos I: one on a circular base in the center of the precinct, commemorating the victory of Attalos I over the Gauls at the mouth of the Kaikos; a second commemorating a series of victories over the Seleucids and Gauls in 225 B.C.; and a third erected to Attalos I by the general Epigenes and the soldiers who fought in these wars. Epigraphical evidence suggests the attribution of the two last donations to Epigonos. Recent studies (Schober) suggest the following reconstruction of the "Great Donation" on a circular base: the colossal "Ludovisi Gaul" in the center surrounded by four statues of fallen Gauls, which would include the Capitoline "Dying Gaul" (PL. 164), a male torso in Dresden, and the head of a Gaulish woman in the Museo Nazionale Romano. For the first two works at least, the hypothesis seems highly probable. This set of sculpture has often been attributed to Epigonos because of the plausible suggestion that the Capitoline piece, in which a horn lies on the ground at the side of the fallen warrior, can be identified with the trumpeter which Pliny (*loc. cit.*, 88) attributed to Epigonos along with the sculpture of a boy caressing his slain mother. However, the profound stylistic differences between the "Ludovisi Gaul" and the "Dying Gaul" raise serious doubts. In every detail the "Dying Gaul" is calmer and more restrained than the "Ludovisi Gaul" (PLS. 162, 163). The latter represents a Gaul, supporting the body of his dying wife, who kills himself rather than fall into the hands of the enemy. The highly pathetic theme, the forceful movement, the emphasis on anatomical relief, the boldness of the composition, and the concentration on the head of the Gaul reflect a taste that is markedly different from that of the "Dying Gaul." The sculptor of the former exploits the new ideals of the baroque, while the sculptor of the latter revives the older ideals of purity of form and restrained psychological expression. The two works may very well be contemporary and part of the same complex, but they are certainly the work of artists of different temperaments, one faithful to the recent past, the other employing the concepts of a new art. The sculptor of the "Dying Gaul" could have been Epigonos, who was active as early as 250 B.C. and perhaps even before.

A representation of a Gaul which has been frequently and groundlessly associated with Pergamene art is the so-called "Gaul of Giza" (PL. 163). It has the vehemence and the emphatic pathos of the baroque, but it differs from the heads of the Pergamene donations in the boldness and directness of its handling of form, in the rapidity of execution, and in its

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

taste for the unfinished, for the free sketch, all of which make the work the highest and most representative of the art center that produced it, Alexandria. (The head is one of the most original and antitraditional works of all Hellenistic sculpture.) It has been variously dated between the end of the 3d and beginning of the 2d century B.C. Sculptures similar in composition to the "Ludovisi Gaul" were created more or less contemporaneously with it. Among these are sculptures of Achilles with Penthesileia and representations of Menelaos with Patroklos. The torso of the figure of Achilles is known in several copies (e.g., in Geneva, Copenhagen), as is a good part of the figure of Penthesileia (in the Borghese *Amazon* and the *Amazon* found near Sette Bagni; Mus. Naz. Rom.). The sculpture of Menelaos with Patroklos is known in its entirety (copies: PL. 162; Pitti; the so-called "Pasquino," against the corner of Palazzo Braschi in Rome; heads in Vat. Mus. and elsewhere). The pose of Menelaos holding his friend Patroklos (according to some, the subject is Ajax with Achilles) is close to that of the "Ludovisi Gaul," and both works have a pyramidal composition. The strong play of movement and force between the two figures of each sculpture creates a solid unity of composition. The two works, however, differ greatly. The nude body of the Gaul is composed of deeply carved forms with tense masses of muscles set on sturdy bony structure, while that of Menelaos represents a rich play of vibrantly sensitive surfaces. In the former work the forms are dry and abrupt, while in the latter they are broad, abundant, and powerful. One cannot fail to recognize in the sculptor of the Menelaos a greater artistic force; his sculpture, with its perfect placement of Patroklos between the legs of Menelaos, is more closely integrated than that of the Gaul, and the body of Patroklos surpasses the dying wife of the Ludovisi sculpture in boldness of placement and force of expression. The latter group displays something of the emphatic quality of the great Pergamene frieze. This quality was not yet evident in the "Pasquino" sculpture, which has sometimes been attributed to Antigonos of Karystos, a sculptor and writer about art who worked on the Attalid votive sculptures celebrating the victories over the Gauls (Pliny, *loc. cit.*, 84). The hypothesis cannot be adequately supported; the sculpture of Menelaos with Patroklos is decidedly one of those cases in which the attribution to the Pergamene school, often declared and generally accepted, is only conjectural. The characteristics of the nude body tend to refute the hypothesis. The work may well have been created in another center of Asia Minor and at approximately the same time as the "Great Donation." In the development of the baroque, Menelaos with Patroklos occupies a place between the "Dying Gaul" and the "Ludovisi Gaul."

The *Artemis and Iphigeneia* from Asia Minor (Copenhagen, Ny Carlsberg Glyptotek), considered an original, is of entirely different quality and importance. The idea of a composition with an erect figure (Artemis) and a fallen one (Iphigeneia) recalls the compositional elements of the two works just examined, but here all similarity ends. The artificial composition, the unsureness of structure, and the hard and inert modeling of the two figures have nothing of the high quality of the previous works. The *Artemis and Iphigeneia* is often dated to the 3d century B.C., but it could be a work of the following century. The original of the so-called "Cesi Juno" in Rome (Cap. Mus.) is perhaps to be included among Pergamene sculpture of the end of the 3d century. It is fundamentally in the same style as the Pergamene female statues contemporary with the great frieze, but it is certainly more modest in its effects of grandeur and chiaroscuro. A large head of a centaur in Rome (Conserv.) is slightly earlier than the altar and seems to presage the pathos, richness, and movement of the heads of certain giants of the great frieze.

The superb *Victory of Samothrace* (PL. 177), an original of outstanding qualities, must have been created between 220 and 190 B.C. The power and daring novelty of the conception, the complexity of the rhythms, the richness in the play of light and shadow, especially in the wonderful chiaroscuro of the drapery, make it one of the greatest examples of the baroque style of this epoch. The goddess, descending from the skies, is portrayed at the instant in which she touches the prow of a ship. The supple body and wide, extended wings vibrate with the movement of flight, while the violent pressure of the wind makes the figure strain forward. The work was probably a Rhodian votive offering erected in Samothrace to celebrate a victory over Antiochos III of Syria. It corresponds in its fullness and maturity of expression to the works of the greatest flowering of Pergamene art, but even in its search for dynamic effects there is a structural solidity and sense of equilibrium which bind it even more closely to the traditional qualities of Greek art.

The next three decades (190–160 B.C.) mark the most intense productivity of the Pergamene school. At this time the sculptural decoration of the Pergamon altar was created, along with several stylistically related works, some of which were set up in the precincts of the altar itself. The colossal altar was only one of the victory monuments that the munificent Eumenes II erected on the Acropolis of Pergamon (PL. 172). The sculptural decoration of the altar comprised the great frieze of the gigantomachy, which ran 426½ ft. around the exterior, on the socle at the base of the colonnade (PL. 173); the small Telephos frieze, which ran more than 242 ft. around the interior of the enclosing wall (PL. 174); and the various sculptures which decorated the crowning element. The date of the complex is almost unanimously accepted as the decades between 190–180 and 160–150 B.C., although there are those (Zschietzschmann, 1939) who have dated it between 220 and 197, attributing the work to the reign of Attalos I.

The names of the gods and giants depicted as well as those of the artists were carved on the two borders that enclosed the great frieze. The names of the artists Theorretos, Orestes, and Dionysiades were preserved in entirety: others which can be completed with a fair degree of certainty are Menekrates, Mnesikles (or Ktesikles) and Melanippos (?). Of these artists Orestes and perhaps Theorretos were Pergamene, Mnesikles (or Ktesikles) was from Tralles, and Menekrates, Dionysiades, and perhaps Melanippos were from Rhodes. The theme selected for the great frieze was traditional in Greek architectural sculpture, but in the manner of its conception by the Pergamene artists it demonstrates a strong interest in representing the extraordinary and the unusual. The allegorical division of the divinities distributed on the four sides of the monument, the presence of obscure mythological figures alongside the most famous gods of the Greek pantheon, and certain unusual aspects of the iconography show the representational program to have been the product of an erudite milieu, perhaps the work of some scholar at the Library of Pergamon. But it must be quickly added that the learned elaboration of the theme has been transfigured and fused by the planner of the frieze in one of the most daring and unified works of all Greek art; never before had the mythological battle been represented as so enormous a cosmic conflict.

The relief almost always projects highly, and the figures generally appear in positions parallel to the background, in back, front, or side views, although some are seen obliquely. The execution is highly refined throughout, and much attention is paid to details (e.g., of weapons, apparel, and jewelry). There are frequent allusions to 5th-century Attic art, especially to that of Phidias, in the rendering of flesh and drapery and in the relationship between figure and background. But these allusions are really superficial. They were made consciously by the Pergamene artists and only serve to emphasize, by contrast, the independence of the Pergamene stylistic idiom. The whirling violence of the movement, the lively inventiveness of episode and gesture, the heightened drama of the expressions, the powerful bodies and heads, and the variety and beauty of the drapery (which often figures in the foreground) are qualities which have nothing in common with the ideals of Attic classical art; they are, on the contrary, a most decided negation of them. From a more strictly formal point of view, the dominant note of the style of the frieze is an intense coloristic sense of light and shade. Smooth and curving forms that turn broad surfaces to the light are contrasted with areas that gather shadows in deeply cut surfaces. In the heads the clear forms of the cheeks and the smooth, broad foreheads contrast with the shaded

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

mouths, open in a cry or in pain, the sunken eyes, and the deep furrows that divide the locks of the hair and beards. Strong effects of light and shade are achieved in the contorted bodies of many of the male nudes, effects that are obtained by strong projections, the interplay of relief surfaces, and the play of light on drapery. The draperies, more than any other element, are used to collect the shadows in their numerous deep hollows and in the frequent rippling of their folds. Scholars substantially agree that one mind was probably responsible for the conception of the frieze. More difficult problems are the number of artists who worked on the frieze, their relative skill, and the relation between their rendering and the original conception of the work. Recent studies have been able to demonstrate that the individual slabs, sculptured in part before being put in place, show the work of at least a dozen artists. These would have carved their names on the monument, while their lesser collaborators, expert and accurate artisans who added final touches and details, would have remained anonymous. The quality of the execution is not of uniform excellence, and the plastic strength in the bodies and heads, the strong drama of the expression, and the force of movement are not always realized with equal effectiveness. There is more than one occurrence of forms that are weak, heavy, or distended, or gestures that are clumsy and awkward and reveal a false theatricality which degenerates into tedious overemphasis. This is not surprising, for the altar was created near the close of the great age of Hellenistic baroque. If the Telephos frieze represents the beginning of the classicizing reaction, the false baroque expressions in the frieze do more than presage another characteristic of the late Hellenistic age. The identity of the planner of the great frieze remains unknown; there is no firm basis for identifying him with the Menekrates who signed the frieze and who might be the Menekrates of Rhodes, adopted father of Apollonios and Tauriskos and creator of the *Punishment of Dirke*, or with the Hellenistic architect Menekrates. Neither can the planning of the entire altar be attributed to Epigonos, who appears to have headed the Pergamene school of sculpture.

The small frieze on the inner face of the wall of the upper level of the altar narrates the story of Telephos in a continuous succession of scenes (PL. 174). As in the great frieze, erudite Pergamenians must have proposed the mythological themes. The fundamental stylistic unity indicates a single homogenous artistic conception, but, of necessity, the frieze was executed by several artists in collaboration. The recognition of the different hands presents a more arduous problem here than in the case of the great frieze. The stylistic qualities of the Telephos frieze differ in many respects from those of the great frieze. The clearest difference is a substantial renunciation of the more extreme baroque expressions in favor of more placid forms; movement and theatricality have been restrained, and relief has become lower, drapery calmer and often linear. There is a revived feeling for classic balance and rhythm and a classical rendition of certain details (e.g., drapery). There is also an interest in spatial representation and in the atmospheric portrayal of external nature, both of which are totally foreign to the great frieze. Even if the realization is sometimes conventional (as in the scene of the construction of Auge's ark), at other times it is fully successful in creating the illusion of figures immersed in atmosphere and moving in real space (as in the slab with Teuthras and his cortege, or the slab with the abduction of the young Orestes). The final profound difference between the two friezes is in the narrative technique. The great frieze unites in a single relief many simultaneous events in which various persons participate; the small frieze relates a series of successive episodes in the life of a principal character (Telephos), who appears repeatedly. This frieze has great importance in the history of relief, since it provides a precedent, certainly not unique but one of the most remarkable, for the illusionistic, narrative, and landscape tendencies of the relief sculpture of Roman times. The remarkable differences between the two friezes of the Pergamon altar do not necessarily indicate an equally notable difference in date, which a study of structure would seem to exclude. The master of the Telephos frieze must have been younger than the master of the gigantomachy and thus open to new interests and to the reaction against baroque style.

The last group of sculptures of the Pergamon altar consists of the statues that adorned the crowning elements over the colonnade. Figures of horses, Tritons, lions, and griffins must have been arranged on three sides of the monument, and a group of divinities almost certainly ornamented the front. The sculptures, smaller than life size, reveal both in conception and in execution a stylistic unity with the friezes, especially with the major one.

The fortunate discoveries at Pergamon have revealed a rich collection of works which makes 2d-century Pergamene art appear extraordinarily compact and unified. Especially noteworthy are a group of Muses, a group of priestesses of Athena, two statues of Athena (a copy of Phidias's *Athena Parthenos* and an Athena with a crossed aegis), a goddess with a peplos (Hera?), a Kybele, a head of Attalos I (the new version), a large head of Alexander (PL. 153), a large statue of Zeus or Poseidon in motion, the female "Beautiful Head," a sleeping hermaphrodite, and a statue of Attis. Some of these sculptures display the same baroque characteristics as the great frieze. The frankly baroque imprint which copies of classical originals have acquired is evidence of the solid unity of Pergamene sculpture. This can be seen in the two statues of Athena, the goddess with the peplos, and the *Kybele* (all copies from originals of the second half of the 5th century), as well as in the *Leda* from a well-known original by Timotheos. The imprint of the Pergamene baroque is even recognizable on a plaque (the foot of a marble table) with a vigorous and luxuriant acanthus plant. The hermaphrodite and the "Beautiful Head" are, on the other hand, examples of the perpetuation or revival of the style of Praxiteles, which, in the second of these statues, is combined with certain traits of Skopas. From the precinct of Athena come some reliefs (representations of weapon trophies, the so-called "little gigantomachy," the Trojan Horse, Athena, and Telephos) which closely resemble in style and execution the two friezes of the Pergamon altar. Among the freestanding sculptures are some that demonstrate a reaction against the extreme baroque, already noted in the Telephos frieze, but they are generally attributed to the period of Eumenes II.

Numerous works found outside of Pergamon also belong to the baroque of the first half of the 2d century B.C. Among them is the beautiful statue of the hanging Marsyas (in the earliest version, exemplified by the sculpture from Tarsos in Istanbul); the strong dramatic quality of the subject, the very rich modeling and powerful play of lights and shadows in the head, and the emphasis on the anatomy of the body relate it stylistically to the altar. Also in this group are the head of a satyr (Rome, Conserv.), which is very similar to a head in the great Pergamon frieze, and a bronze Hermes with a petasos (Br. Mus.). The latter, perhaps an original, renders Lysippian concepts in nervous and vibrant forms that presage certain vigorous late-Hellenistic figures. Others in the group are a magnificent female head from Tralles (İzmir, Arch. Mus.) and a colossal statue of Apollo (also from Tralles; Istanbul, Arch. Mus.), both of which are impressively conceived with a broad, fluid treatment of forms, one with pathos and the other with mild sensuality. Related, too, are the very fine female head from the Serapeion of Alexandria (PL. 178); a large head of Helios from Rhodes; some draped female statues from Rhodes, Kos, and Samos; the old centaur and the young centaur (copies in Rome, Cap. Mus.); the bronze dancing satyr of the House of the Faun in Pompeii (PL. 200); the group of satyrs fighting with giants (Rome, Conserv.); a head of Zeus (Syracuse, Mus. Arch. Naz.); and the monumental head of Poseidon (Copenhagen, Ny Carlsberg Glyptotek), as well as a fine small bronze of the same god in the Louvre. The last two works are among the rather limited examples of the Alexandrian baroque. The pediment sculptures from the Hieron at Samothrace (Vienna), now dated to the middle of the 2d century, can also be counted among the examples of this trend. A sculptural ensemble erected by Damophon of Messene at Lykosoura (Arcadia) in the first half of the 2d century must be considered a hybrid

compromise between Attic traditionalism and baroque forms. From this group have survived the heads of Demeter, Anytos (PL. 187), and Artemis. Two acroteria (Nikai in flight) from the Agora in Athens have been considered rare and valuable evidence of Attic reflections of the Pergamene baroque of the first half of the 2d century. The group of the two girls playing the game of *ephedrismos* (Rome, Conserv.) is a fine restatement and development in the baroque manner of the motif of strongly agitated draperies that had been dear to the Attic style of the 5th and 4th centuries.

As early as the 4th century, portraiture aimed at realism. The Hellenistic period further developed this tendency not only through persistent fidelity to the subject but also through the attempt to express psychological content. This is reflected in a certain predilection for representing the aged, the ugly, and the exotic. After the period of the simple style, the portrait became a richer and freer expression of sentiments, with a more original and varied stock of forms, and showed a renewed interest in effects of light and shade (an interest shared by 4th-century portraiture). In the decades between 250 and 190 were created some of the finest portraits of the new tendencies, which were growing even stronger. Most worthy of mention is the superb bronze head of an old bearded philosopher (PL. 156) from Antikythera. There is a sense of power in the realistic expression, which is solid in structure as well as rich and free in modeling. A trenchant comparison of the old and new tendencies can be made by setting the so-called "Solon" from Herculaneum against another bronze portrait of a bearded old man from Herculaneum, the so-called "Demokritos," dated between 240 and 220 B.C. The calm, almost severe tone and the compactness of form of the Solon are replaced in the Demokritos by a looser, richer, and more mobile treatment. The less elevated, more diffuse vigorous spirituality of the latter is substituted for the controlled inner tension of the former. The characteristics of the Demokritos are even more marked in the *Cynic Philosopher* (Cap. Mus.), where the handling of light and shade reaches one of its highest expressions, not only in the very effective head — in the free and unrestrained variety in the treatment of the wrinkled and sullen face and in the modeling of the hair and unkempt beard — but also in the massive volumes and movement of the mantle. The feeling for naturalistic detail found expression not only in the treatment of the face and nude flesh, but also in the solid posture, which is free of any sense of being posed. This particular manifestation of realism is even more effectively conveyed in the admirable small bronze statue called "Hermarchos" (Met. Mus.), an original of the last decades of the 3d century. The hesitant turning and drooping of the head on the obese body (which is sustained with difficulty by the thin, spread legs), the flaccid forms of the chest, and the disordered arrangement of the cloak present a newer image than the Capitoline *Cynic*, and the work is even farther from the traditional male portrait statue than is the latter. Similar in tendency are such noteworthy portraits of the period as the Type B *Epikouros* (copy in New York, Met. Mus.) and the seated statue of Chrysippos, a work of Euboulides. A comparison of the former with the Type A *Epikouros* (the Copenhagen example mentioned earlier) reveals the transition that occurred in portraiture between the first decades of the century and the last. This strongly coloristic portrait of Epikouros is infused with a magnificence that suggests a Near Eastern origin. A portrait bust of Chrysippos (PL. 170) displays different tendencies; it gives greater attention to minute detail, has a more compact structure, shows the obvious survival of simplifying qualities in the draperies, and even exhibits tendencies toward schematization in the fine modeling of the face (note the wrinkled forehead). This bust is almost certainly modeled after a famous original from the Kerameikos in Athens, which is attributed to the Attic artist Euboulides (end of 3d cent.), and is known in many copies (Br. Mus.; Vat. Mus.; etc.). It has many characteristics in common with another statue, perhaps a few decades older, which must have been famous among the ancients; this is the so-called "pseudo-Seneca," among the finest copies of which (there are about forty) is the well-known bronze from Herculaneum (PL. 170). Despite the elaborate modeling of the neck and wrinkled face and of the long and disordered locks of hair, and despite the chiaroscuro effects obtained through that modeling and through the shading of the deep-set eyes and open mouth, the work has a structural force that recalls the style of the first half of the 3d century. A celebrated sculpture of an old woman drunk, copied many times in the Roman period (copies in Munich, Glyptothek; Rome, Cap. Mus.; and elsewhere; III, PL. 210), belongs to this strong realistic trend of the second half of the 3d century. It may be the *Anus ebria* (drunken old woman) of Smyrna which Pliny mentioned (*op. cit.*, xxxvi, 32) and wrongly attributed to the great Myron of the 5th century, whom he had evidently mistaken for the Theban bronzesmith of the same name who collaborated on the Pergamene votive offerings for the victory over the Gauls. The old woman, gaunt and bedraggled, squatting on the ground with a *lagynos* (wine bottle) in her hands, throws back her head and opens her mouth in a lament. The closed composition of the body, with the divergent ascending line created by the position of the head appears, as has been seen, in other 3d-century works. In the history of crudely realistic subjects, the Theban Myron's old woman occupies a place somewhere between the examples of the early Hellenistic period (e.g., Vatican fisherman, PL. 366; the old woman of Neviodunum) and those of the late. The head of Euthydemos I of Bactria (Rome, Mus. Torlonia) is a finely sculptured contemporaneous example of a taste for unrelieved ugliness.

Among those portraits which can be dated in the decades around 200 B.C. are some that — in their sober handling of form, in their more moderate concern for realism, and in the psychological penetration of their aristocratic subjects — seem to revive portrait concepts of the simple style, though employing the freer and more active forms of the time. To this group belong the *Antiochos III of Syria* in Paris (PL. 171), the *Arsinoë III* in Mantua (Palazzo Ducale) and the one in Boston (Mus. of Fine Arts), a head of Alexander from Tivoli (Rome, Mus. Naz. Rom.), the portrait of Menander, the head of a priest in Athens (Nat. Mus.; A Br. 343/44), and the *Epikouros* of Type C (Rome, Mus. Barracco and Cap. Mus.).

Throughout the period of the bold and triumphant baroque, there survived the fresh, delicate vein of the rococo in Hellenistic sculpture, producing some of its most significant works; the coexistence of such diverse tendencies is indeed unusual. While at Pergamon such works were being created as the great dedications and the gigantomachy, the imagination of Boethos created his playful *Boy Strangling a Goose* (VI, PL. 58), a theme that had already been treated in the early Hellenistic period (Herodas, *Mimiamboi*, iv, 3–34; the little statue of Ephesos). Boethos' sculpture was born of a spirit that took pleasure in contrasting the awkward forms of the animal and the graceful ones of the boy. Showing similar interests are such works of the same period as the small statue of Herakles strangling the serpents (Uffizi), the bronze satyr of Pergamon, the young satyr tipping his wineskin and the satyr immersed in sleep (both Naples, Mus. Naz.), Eros and Psyche joined in a tender embrace, and many representations of nymphs, little satyrs (PL. 168), Erotes, and smiling girls. The erotic hermaphrodite and satyr in Dresden perhaps dates from this time. A statue of a sleeping hermaphrodite (copies in Louvre; Rome, Mus. Naz. Rom.) can be dated about 160 B.C. and attributed to Polykles, an Attic artist of the first half of the 2d century. Though different in many respects, it seems to echo the warm sensuality of the "Barberini Faun" (PL. 169). The theme of the reclining figure immersed in sleep returns in sculptures of putti, Erotes, and Thanatos, a new pretext for depicting the grace of childhood. Among the many representations of this subject is an outstanding bronze original in the Metropolitan Museum, probably dating from the period between 200 and 150 B.C.

*d. The eclecticism and classicism of the late Hellenistic period.* As has been noted, the art of the late Hellenistic age is characterized by eclectic works that generally tend toward classicism. Though the classicizing reaction to the baroque that occurred about 160 B.C. adhered to the criteria of the Atticizing scholars of antiquity (Pliny, *Naturalis historia*, xxiv, 51) on the "revival

of Art" (i.e., of what they considered "true art"), this certainly did not mark a sudden end to baroque art.

The baroque was not extinguished then, even though in many cases it had degenerated and repeated trite formulas. It was really from a protraction of baroque concepts that some of the most frequent types of sculpture of this period were produced. Divergent lines of composition, forms of false grandeur, and the interaction of broad, heavy masses and surfaces empty of structural solidity are characteristic qualities of the sculpture of this period. The degeneration of the baroque had already begun at the time of the Pergamon altar; the tendency toward centrifugal compositions and voluminous masses with loose internal structure is evident in a number of figures in the great frieze. In baroque sculpture of the late Hellenistic age the search for unexpected effects and the love of pathos often weaken and degenerate into overemphasis, false theatricality, and decorative values no longer felt in their true significance. The play of light and shadow was to lose some of its dramatic impact, and the strong expressions of coloristic realism in the portrait and genre subjects were to deteriorate into a cold, trite, manneristic realism. This is not to say that the new epoch did not see some fine works created in the baroque tradition, works perfectly sound and still very much admired. It is sufficient to mention the *Aphrodite* ("Venus de Milo"; PL. 176) and *Poseidon* of Melos (Athens), the *Zeus* from the Temple of Hera at Pergamon, some figures from the "Small Donation," the bronze male portrait from Delos, and, in the Neo-Attic period, the sculpture of Triton and a Nereid in the Vatican Museums (PL. 188), the *Laocoön*, the *Gladiator* by Agasias, and the two works of Apollonios, son of Nestor. Statuary types of the 4th century B.C. provided the prototypes of the *Aphrodite* and the *Poseidon*, both of which were sculptured in the years immediately following 150 B.C. But it is the spirit of the first half of the 2d century B.C. that gives these two reelaborations of earlier types their sense of grandeur and emphasis as well as their unquiet rhythms and centrifugal composition that tend to dilate figures in space. In the head of Aphrodite the classical ideal is translated into broad but structurally weak forms in accordance with the concepts of the period. Much more vigorous is the Pergamene baroque, as exemplified in the powerful proportions, agitated drapery, and imposing stance of the headless *Zeus* from the Temple of Hera at Pergamon (Istanbul, Arch. Mus.). Centrifugal composition, emphatic posture, and solid masses of flesh characterize the so-called "Hellenistic ruler" (PL. 185), the *Herakles* of the Ara Maxima (Rome, Conserv.), and the *Poseidon* from the former Loeb Collection in Munich. In the first (Demetrios I Poliorketes of Syria?) the artist has revived Lysippian sculptural types (*Alexander with the Lances*) and sense of proportions, but the modeling, the realism of the head, and the vigorous posture of the body reflect new ideals. The statue of Herakles represents a degeneration of Lysippian ideals in baroque forms that are repellent in their vacuity. It seems to be a reelaboration (50 B.C.) of a late 4th-century type which also may have inspired a small bronze from Byblos (Br. Mus.) of the 2d century. The small statue of Poseidon, from the former Loeb Collection, is a more significant example of open-form composition; it is slender and shows more restrained modeling than the other two bronzes. Similar to the *Poseidon* in their emphasis on open rhythms are the *Muse with the Scroll* (Venice), part of the so-called "Philiskos group," and two bronzes of wholly different artistic merit: the *Running Boy* in the Prado and the "Jockey" from Cape Artemision (PLS. 182, 183); these two works are not, however, of baroque inspiration. The beautiful bronze head from Delos (PL. 165) is probably some decades later than the "Hellenistic ruler." A less individualized expression, the head from Delos is influenced more by classicistic currents and is more moderated in modeling, though the volumes are more synthesized. A taste for abundant and fleshy forms and a weak sense of structure characterize the so-called "Pyrrhus of Epirus" in Copenhagen (Ny Carlsberg Glyptotek), the "Berenike" of Herculaneum, an Alexandrian princess of the second half of the 2d century, and a Pergamene head of uncertain identity (Attalos III, Ariarathes IX?). The first is closer to the figural schemes of the early Pergamene baroque, but there is a false grandiosity in the expression. The two others are more advanced in the soft uniformity of the modeling and the generalization of expression, and they have a classicizing tendency to symmetry and regularity in the facial features. Among the works of the late baroque period whose spiral stance and coloristic play of light and shade are tempered by classicizing influences is the noble statue of a draped young person from Kos. The head of Mithradates VI Eupator, covered by a lionskin, represents an attempt to recapture the fire of earlier Pergamene sculpture by recourse to an academic formula of plastic firmness and precision of detail. The nearly contemporary type of the *Socrates* in the Villa Albani, Rome (early 1st century B.C.), is a similar compromise between decorativeness and a baroque plastic richness and movement.

A very significant example of the prolongation of the baroque combined with the eclecticism of the late 2d century is the so-called "Small Donation" of Pergamon (PL. 175), erected by Attalos II (159–138 B.C.) on the Acropolis in Athens (Pausanias, i, 25, 2). The bronze original comprised less-than-life-size statues depicting episodes of the gigantomachy, Amazonomachy, Marathonomachy, and Galatomachy; elements of it survive in Roman copies (Naples, Mus. Naz.; Venice; Vat. Mus.; Louvre; Aix). The vagueness of the literary evidence on which the existence of this donation in Athens has been based (copied from a similar one existing in Pergamon?) has created doubts as to whether it should be attributed to Attalos I or Attalos II. However, a comparison with the elements of the "Great Donation" and the great frieze of the Pergamon altar renders the second attribution much more probable. While some elements of the group go beyond the great frieze in emphasis on the power of the nude body and elaboration of faces distorted by intense emotions (e.g., sculpture of a fallen giant in Naples, Mus. Naz., and of a fallen Gaul in Venice, Mus. Arch.), the fallen Gaul in Naples is a weak adaption of the Capitoline "Dying Gaul" from the "Great Donation." Some figures are conceived according to a complex spatial vision (e.g., the fallen Gaul in Venice, PL. 175, and the fighting Gaul in the Louvre), whereas others are conceived according to a flat compositional scheme with a single point of vision (e.g., the fallen bearded Gaul in Venice, Mus. Arch.; the fighting Persian, PL. 175). In the attitude of eternal sleep, in the plastic unity of the broad planes, and in the very beautiful head, the dead Persian in Naples represents the most marked contrast to the dead giant in the same museum.

Other baroque works, stylistically and chronologically close to the "Small Donation," include statues of Amazons fighting on horseback (Naples, Mus. Naz.; formerly, Rome, Villa Patrizi, from a Pergamene group?) and fragments from a highly dramatic sculpture of Odysseus and his companions in desperate battle with Scylla (Palermo; Rome, Vat. Mus.; and elsewhere).

Another baroque work, the *Punishment of Dirke* (formerly in Rhodes) by Apollonios and Tauriskos of Tralles, can be dated to the late 2d century because of its agitated and dramatic theme and its large conception. It is known primarily through a cold and altered Roman copy (3d cent. of our era), the Farnese *Bull* (Naples, Mus. Naz.), which was found at the Baths of Caracalla. The colossal work represents Dirke at the moment when Amphion and Zethos chain her to the maddened bull. (The figure of Antiope in the Farnese copy was added by the Roman copyist.) There were allegorical and realistic landscape elements in the complicated pyramidal sculpture (perhaps derived from a painting); it is not known to what degree the cold classicism of the 3d-century copy reflects the style of the original. Another imposing Roman statuary group, the personification of the Nile in the new wing of the Vatican Museums, is also believed to derive from a painting by way of an original marble; the Roman copy was found at Iseo in the Roman countryside together with a matching statue of the Tiber personified. The stylistic idiom of the original of the Nile cannot be reconstructed from the cold and precise copy of the 2d century of our era; however, its qualities (which are also lost in the imitation of it in the personification of the Tiber) must have included grandeur and broadness of form in the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

serene and solemn figure of the Nile, which was contrasted with the restless crowd of 16 putti (alluding to the river's maximum flood of 16 cubits) and with the witty liveliness of the Nile landscape scenes depicted around the base of the monument. The original of this noble Alexandrian creation is difficult to date; the broad and impressive forms of the nude body could suggest a date in the 3d century B.C. (when an allegorical subject would not be surprising). But since Alexandrian monuments with similar reclining figures have been dated to the 2d century B.C., it is likely that the original of the Nile was also created at that time. These Alexandrian monuments are a statuette of the Nile from Alexandria (Stuttgart), the figure of Zeus in the Archelaos relief, and two pediment sculptures of the Hieron in Samothrace. They were formerly considered products of an early phase of Hellenistic baroque (ca. mid-3d century), but are now thought to date from about 150 B.C. The previously mentioned head of Poseidon in Copenhagen (Ny Carlsberg Glyptotek) and a type of Serapis (Cairo, Eg. Mus., no. 46343) different from the one attributed to Bryaxis may also be considered late-baroque Alexandrian works. Other works of this category include some limestone sculptures from the Serapeion in Memphis and some small bronzes (e.g., a *Poseidon* in the Louvre; an athlete formerly in the Matossian Coll., now in Baltimore, Walters Art Gall.).

The Amazonomachy depicted on the frieze of the Temple of Artemis at Magnesia ad Maeandrum (PL. 175; Berlin, Staat. Mus.) dates from about 150 B.C. It is a work of modest quality, reviving classical schemes in a strongly projecting relief with a feeling for the play of light and shade and an emphasis on movement and anatomical details; but it produces no real effect, and the composition is fussy and confused. The long frieze of the Hekateion at Lagina, Caria (PL. 187), of interest not for superior quality but for the type of composition, dates from the period between the end of the 2d century B.C. and the beginning of the 1st. The various subjects depicted include the birth of Jupiter; a representation alluding to the alliance between Rome and the cities of Caria, symbolized by Amazons; and the gigantomachy. While some parts of the relief are rendered with an interest in spatial illusionism that often goes beyond even the Telephos frieze of Pergamon, elsewhere the classicizing impulse, which is also indicated in the modeling of the individual figures, dictates a frontal and symmetrical view of the compositional elements. The depiction of landscape in relief developed throughout the Hellenistic period, but it was particularly in the later phase that certain characteristics were emphasized which were to be absorbed by Roman art. Establishing a setting for figural scenes by means of architectural and landscape elements, a technique that had been abandoned in classical reliefs, revived and became popular during the Hellenistic period; from an accessory element the landscape often became the main subject of the work. (This development probably occurred, as well, in painting.) The simple concern to suggest the location of a scene turned into a desire to express the profound meaning and poetry of landscape, which in the Hellenistic age was almost always rendered in the tone of a bucolic or sacred idyll. This particular type of landscape relief appears to have been popularized by the Hellenistic art of Alexandria. With the interest in representing nature came an interest in spatial illusionism in contrast to the classical tradition (which was never entirely abandoned, however) of a uniform background. There are landscape and illusionistic elements in the Telephos relief, though they are absent from the gigantomachy relief. Nevertheless, the taste for scenic accents and even for the true idyllic landscape may date as early as the 3d century B.C. The form was the relief picture (of bronze, stucco, or marble), first developed in the Hellenistic period and popular in Roman times, when antique models were copied in marble and new works were generally created according to the old repertory. Among the definitely Hellenistic landscape reliefs, copies and originals, are those of the so-called "Satyr Drama" (copies in Naples, Mus. Naz.; Rome, Cap. Mus.; and elsewhere), that of Orpheus (Oxford, Ashmolean Mus.), the relief from Tralles (Istanbul), the bronze panel of Delos, the Alexandrian originals of the Carthaginian panel (Louvre) and of the Saturnia Tellus panel from the Ara Pacis Augustae in Rome (III, PL. 488), the Archelaos relief (Br. Mus.), the Offering relief in Munich, and the original of the Dolon relief (copies in Vienna, Kunsthist. Mus.; Rome, Mus, Naz. Rom.). Some celebrated reliefs executed in the early Roman Imperial age are certainly in the Hellenistic and Alexandrian tradition, if not copies of originals of that time and place. Among these works are *Polyphemos* (Rome, Villa Albani), the pair of Grimani fountain reliefs (Vienna, Kunsthist. Mus.), and the Munich relief of the peasant going to market. The dating of all these reliefs is extremely problematical: the "Satyr Drama" and the *Orpheus* appear to be early (3d century); the other works are variously dated to the 2d and 1st centuries B.C. Relatively precise information permits dating the Delos bronze between the 3d and 2d centuries (in any case before 166 B.C.); the Archelaos relief about 125 B.C.; and the Munich Offering relief to the first half of the 2d century and shortly thereafter. The concepts which inspired these reliefs seem to have nothing in common with either baroque or classicizing tendencies.

Many draped female statues from Samos, Delos, Kos, Magnesia, Pergamon, and elsewhere can be dated to the second half of the 2d century. Often they can be dated by factual evidence, thus acquiring particular value as points of reference for the study of contemporaneous stylistic evolution (e.g., the statues from Delos of Isis, 128–127; Cleopatra, about 138–137; Roma, about 110–109). The remains of relief figures which decorated the two great altars of Priene and Magnesia ad Maeandrum (erected between about 160 and 150) belong to a slightly earlier period. In the complexities of these sculptures the tendencies proper to the period meet and cross, sometimes in the same work: the concepts of imposing forms, of restless and dynamic rhythms, of a coloristic play of light and shade converge and mingle with those of a classicizing taste for more restrained and tranquil forms and for linear drapery folds. In many of these works an attempt has been made to achieve an effect of transparency in silk veils (the *coae vestes*) that envelope the figure and to contrast them with the heavy and very rich chitons underneath. A typical example of this device can be seen in a group of the Muses that must have enjoyed great popularity among the Romans, judging from the number of extant copies; this is the group formerly attributed to Philiskos of Rhodes. Elements of it are found reproduced in two Hellenistic reliefs of slightly later date than the original: the panel signed by Archelaos of Priene, which may have been created in Alexandria, and a circular base for a statue from Halikarnassos (both, London, Br. Mus.). The better-known figures of the group are Polyhymnia (PL. 186), Terpsichore, Kleio, the Muse with the small lyre, and Ourania. The tendency toward decorativeness and classicizing ideals, evident in the rendering of the draperies and in the compositional rhythms of the figures, is accentuated in some of the heads that are known.

Some other particularly significant examples of baroque works from the last period of Hellenistic art should be noted. The most important of these is the *Laocoön* (of which more will be said later). Others include the drunken satyr lying on a wineskin (Naples, Mus. Naz.); a large torso of a satyr, perhaps an original, in Florence (Mus. Arch.); the satyr from the *Invitation to the Dance*; some small female statuettes with slender bodies (in Athens, Pergamon, Budapest); two Neo-Attic works by Apollonios of Athens, son of Nestor: the boxer (PL. 366) and the Belvedere torso (PL. 367); and the fragment of a female statue in Piacenza, signed by Kleomenes. Hellenistic baroque was exhausted with the triumph of Atticizing classicism in the Augustan age. In the second half of the 2d century, Roman art was to cultivate anew the baroque concepts of richness of form, emphasis on emotional content, and especially the effort to achieve coloristic effects of light and shade. But this new art was a spontaneous flourishing of new forms, not a return to the past (as had been the classicism of the early Imperial age).

A taste for rococo themes and for realism was responsible at this time for some works that, though outside the classicizing reaction, adhered to the Greek traditions of measure and balance. Genre subjects and representations of nymphs and satyrs continued to enjoy great favor; they were fostered by

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

ideals of tender grace and fresh sensuality and a strong realism which, when crude, tended toward caricature. Mention will be made of only a few of the many representations of this trend, which continued to find particular favor in the production of terra-cotta statuettes and small bronzes. The *Invitation to the Dance*, a sculpture representing a satyr beating a *kroupezion* (clapper) with his foot and requesting a dance from a seated nymph who is untying her sandal, is known through several copies (Uffizi; Brussels; Frankfurt) and through its portrayal on a coin from Kyzikos. Although the sculpture is composed of two separate elements, it is admirably held together by the converging glances and harmony of mood of the two figures. The complex articulation of the figures in space, the novelty of the theme, and its fine realization suggest a date near the middle of the 2d century. The satyr clutching a nymph (copies in Rome, Conserv.; Br. Mus.; and elsewhere), that of Pan drawing a thorn from the foot of a satyr (copies in Louvre; Rome, Conserv., Vat. Mus.; and elsewhere; PL. 188), the fine smiling satyr in Munich (an original?; PL. 182), and the "Quartet" of satyrs of the Portico of Octavia (Pliny, *Naturalis historia*, xxxvi, 29; which may be recognizable in Roman copies) belong to about the same period. The *Triton and Seilenos* (Louvre) and the Triton carrying off a Nereid (PL. 188) are dated to the end of the 2d century. The latter is a work of high stylistic quality and one of the most "painterly" sculptures in Hellenistic art; a relation to the work of Arkesilaos has been suggested. To Heliodoros, a Rhodian artist of the same period (ca. 100 B.C.), has been attributed the original of a Pan teaching the young Daphnis to play the syrinx, which is known through copies or reelaborations of the Roman period (Naples, Mus. Naz.; Rome, Mus. Naz. Rom.). (Pliny, *loc. cit.*, seems wrongly to attribute to Heliodoros a sculpture of Pan and Olympos.) The effect of contrasting a fluid human body with the half-animal one of Pan also distinguishes the famous sculpture found at Delos (Athens, Nat. Mus.) in which Pan tries to grasp a plump, nude Aphrodite. But here there is a salacious, sensual note that is absent in the Heliodoros group. Aphrodite responds to Pan's attack with a mild threat, raising a sandal in her right hand. A lighter touch and a greater refinement of forms mark some of the more representative works of the same trend. These include the female satyr (*Panisca*) of the Villa Albani; the Grimani altar (Venice, Mus. Arch.), on the four faces of which are scenes with maenads and satyrs (the scene called "The Kiss" is particularly fine); and the exquisite group of three nymphs for a fountain (Louvre, formerly Rome, Gall. Borghese). These sculptures have the decorative virtuosity characteristic of so much of the work of Neo-Attic artists.

While classicizing influences severely modified the interest of the Hellenistic age in the realistic portrait, another aspect of realism persisted in a notable part of the sculpture of this period. A taste for realism led to two extremes: a trite verism, on the one hand, and caricature and the grotesque, on the other; but it also led to a particular type of portrait of gaunt and unadorned realism, which was as humble as academic verism was elaborate. The realistic trend still produced fresh masterpieces, among which are the small bronze of a Nubian musician (PL. 184), the bronze "Jockey" from Cape Artemision (PLS. 182, 183), the bronze grotesques from Mahdia (PL. 184), and the four grotesque statuettes of bread vendors (*placentarii*) found in Pompeii. The first two continue the tradition of coloristic realism; the other small bronzes reflect some of the most felicitous moments of Alexandrian art. Among the numerous grotesques — terra cottas, small bronzes, small marble statues — which parallel those from Mahdia and Pompeii is a rare marble statuette of a dancing pygmy from Alexandria, a fine example of the Alexandrian interest in attempting *sfumato* effects in sculpture. Entirely different is the realism which characterizes certain now-famous statues of fishermen, peasants, and shepherds, the renowned portrait of the blind Homer (III, PL. 209), the Sophocles of the Arundel type, and, most famous of all, the *Laocoön*. The first-mentioned of these continue the traditional themes of the old, the poor, and the derelict; among them are the bronze fisherman from Volubilis, the old peasant woman in New York (Met. Mus.), the aged shepherdess (VI, PL. 59) and the old fisherman in Rome (Vat. Mus.), and an aged nurse by Harpokrates in Rome (Vat. Mus.). The realism of these works is almost always academic verism, minutely descriptive and lacking all creative force. Almost the same criticism can be made of the blind Homer, a celebrated portrait of which there are many copies (e.g., Naples, Mus. Naz.; Louvre; Verona); but it is saved by the painful spirituality that animates it. The beautiful bronze head of the Arundel *Sophocles* is characterized by a realistic sense that is modified by a strong classicizing regularity and symmetry of the features.

The emphatic descriptive realism and strong pathetic expression of the Homer bring to mind one of the best-known Hellenistic works, the *Laocoön* (PL. 189), the work of the Rhodian sculptors Hagesandros, Athenodoros, and Polydoros (Pliny, *loc. cit.*, 37); it is usually dated about 50 B.C. (although some scholars have dated it variously between the time of the Pergamon altar and 25 B.C.). The great emphasis on pathos, the violent contortions of the bodies, and the strong relief of the rich modeling place this spectacular work of the last period of Hellenistic art in the main line of the baroque. The classicizing tendencies of the period are evident in the arrangement of the figures, which are set as though part of a façade. (This type of arrangement is more accentuated in numerous other contemporary works.) In its minute observation of anatomical details, it bears the marks of the academic verism of the late Hellenistic period, so different from the manner of treating the nude body in the Pergamene period. Nevertheless, the fundamental conception of the *Laocoön* harks back to Pergamene precedents. In spite of the entanglement of serpents' coils enveloping the figures, the composition, which can be contained in an isosceles triangle (the right arm of Laocoön has been newly restored closer to his head), is based on the juxtaposition of separate elements, according to the method used often in this period. At Sperlonga, Italy, in a grotto with a nymphaeum, have been found the remains of imposing groups in the Hellenistic baroque style along with many other fragments of sculpture. One of the sculptures concerns the legend of Scylla and the companions of Odysseus, another is a replica of the Menelaos with Patroklos, and a third represents a giant with a serpent. Along with these, parts of an inscription have been uncovered bearing the name of Hagesandros and another name ending in -oros. Besides raising the question of assigning the signature to one of the Sperlonga works, this very important discovery brings up the problem of the relationship of these sculptures to the *Laocoön*. Since the inscription also gives the artists' patronyms (unknown for those of the *Laocoön*), the question of the date of the celebrated Vatican work is raised anew. It would seem, however, that the Sperlonga signatures refer to artists living between the second half of the 2d and beginning of the 1st century B.C.

In the late-Hellenistic portraits mentioned earlier, the realistic style assumes a completely different aspect from that in the *Laocoön* and is represented especially by examples from Egypt — some in a Greco-Egyptian eclectic style — from Delos, and from Athens. Their incisive lean, dry, and reserved realism recalls that of many late-republican Roman portraits. This circumstance has suggested the two contrasting hypotheses that late Alexandrian, or Hellenistic portraits in general, influenced Roman republican portraits or, inversely, that Italo-Roman portraits influenced late Hellenistic ones. The most likely explanation of these similarities is that a taste for a portrait form which reacted against the strongly coloristic and often pompously empty portraits of the preceding age was common to various Mediterranean centers in the 1st century B.C. This does not preclude the possibility that future studies may reveal specific influences exerted by some centers on others. For example, Alexandrian influence on the portraits of Athens, Delos, and Rome seems probable in many cases. In the intricate crossing and overlapping of tastes and tendencies of the late Hellenistic age, the concern with this portrait type did not eliminate the taste for more richly conceived, coloristic portraits. It was this taste, in fact, that inspired many Roman portraits of the period from the 1st century B.C. to the beginning of the Empire. Among the subjects of such portraits are obscure

Romans as well as great ones: A. Postumius Albinus (Louvre), the so-called "Tivoli General" (Rome, Mus. Naz. Rom.), Pompey (Copenhagen, Ny Carlsberg Glyptotek), Cicero (London, Wellington Museum; Mus. Vat.; Uffizi), the so-called "Sulla" (Vat. Mus.), and, later, some portraits of Agrippa and Augustus.

The classicizing current was, in a certain sense, the most influential in this period and the one which was destined to enjoy the greatest favor and development in the early Imperial age. Attic art had remained outside the emotional baroque movement of the Near Eastern areas, even though it influenced such 2d-century works as the *Zeus* of Eukleides (Athens, Nat. Mus.), the *Apollo* of Timarchides (Cyrene type in Br. Mus.), and the Leptis Magna type of Dionysos with a satyr (perhaps by Timarchides). However, several Attic sculptures, notwithstanding their distinctly classicizing aspect, reflect those tendencies (toward a dissolving of structure, uniformity of modeling, and lifeless expression) that also characterize so many belated-baroque works created outside of Athens, and outside of continental Greece generally. Among such Attic sculptures are the previously mentioned works of Damophon, along with others attributed to him or his circle (*Asklepios* of Piraeus, the two large heads of female deities in Copenhagen, Ny Carlsberg Glyptotek, and in Rome, Cap. Mus.) from the first half of the 2d century; the stele of Polybios from Kleitor and the remains of Euboulides' monument from the Kerameikos in Athens (head of Athena and the torso and head of Nike), from the immediately succeeding period. At that time Athens again became an important art center, for a return to the ideals of the past necessarily signified a return to the classical traditions of Attica.

Although many Attic artists were active in the numerous centers of late Hellenistic art, Athens was not the guiding center of the classicizing movement in this period. Classicism was a phenomenon common to the entire Hellenistic world, and was the natural reaction to the excesses of the late baroque. Signs of classicism are present in the reliefs of the Pergamon altar (especially in the small frieze) and in that contemporary sculpture which was intended to copy or imitate classical works. The return to classical ideals was marked by calmer movements and poses and a renewed sense of measure and balance. Specifically, there was a return to structural compactness and a reaffirmation of the continuous, rather than the broken, agitated line and a consequent linearization of drapery folds. There was a tendency to idealize or generalize psychological expression; thus facial features became more regular and symmetrical. There were a wider use of frontal compositions and flattened volumes and a resumption of classical figure types, which was to result in the organized manufacture of copies. Of the period after 150 B.C. in Pergamon are some draped female statues bearing the stamp of classicism, many of which do not even preserve the memory of the imposing and dynamic manner of such works as "Tragedy" (PL. 174). The same observation can be made regarding some isolated heads (head of a monarch, head of an ephebos, female head, bust of a princess), whose faces are more or less idealized and whose forms are calm and simple. The return to the past is even more clearly affirmed in a pair of decorative figures bearing lamps, found in the last royal palace of Pergamon, and in the elegant reliefs of dancers on a circular monument, inspired by well-known types from the end of the 5th century. (The motif of these dancers became popular in Neo-Attic sculpture.) In these works archaic types and fashions were revived according to a taste which developed in the early Hellenistic period and gradually became diffused in the 1st century B.C. and in the early years of our era. An insistent affirmation of the older Pergamene school is evident even in these late productions: the figures of the dancers have something of the figures of the great frieze (one of the Moirai, for example), and the rigid stylization of the draperies of the lamp bearers does not entirely suppress the coloristic play of light and shade.

The so-called "Alexander" from Magnesia ad Sipylus (Istanbul) is one of the most significant examples of those works in which classicizing tendencies coexist with the feverish declamatory style of the preceding period. It is perhaps a work of the Pergamene sculptor Menas. Although the statuary type is classical (an Alexander by Leochares has been suggested as the model), it is rendered in a baroque spirit. The classicism of this statue is evident, rather, in the strongly idealized head, which harks back to the most traditionalistic sculpture of the 4th century. The considerable classicism of the Pergamene heads mentioned above and of the "Alexander" from Magnesia ad Sipylus parallels that of the heads of a group of Muses attributed to Philiskos. Related to the "Alexander" are such other significant expressions of the classicizing academicism of late Hellenistic portraiture as the two delicate heads of youths in Rhodes and Venice, probably dating from the last decades of the 2d century or slightly after. Of greater physiognomic interest in spite of their classicist tendency are the *Poseidonios* in Naples (PL. 187), a touchstone for the chronology of the classicizing portrait and dating from 80–70 B.C., and a delicate male head from Delphi with a slight beard. Further examples of the classicizing portrait are the *Eretrian Youth* (Athens, Nat. Mus.), the Type-B *Hermarchos* (Rome, Mus. Naz. Rom.; Alexandria; etc.), and a very refined and elaborate Alexandrian portrait of a woman with a complicated curled coiffure (Uffizi; New York). The standing boy from Tralles (Istanbul), with its gentle, poetic air, is a notable work in spite of the eclecticism of its forms; it was formerly attributed to the simple style of the 3d century B.C. Withdrawn and thoughtful, and extremely sober in its forms, the head clearly reveals the inspiration of Polykleitos, but the leaning figure with crossed legs and the rendering of certain details of the head are in contrast to the Polykleitan inspiration and reflect later tastes.

The *Laocoön* has already been mentioned as an example of flattened compositions with frontal views; but since some elements of the composition are developed in depth (notably the figures of the sons), it is not flat to the degree that often characterizes other sculptures of this trend, which seem enclosed between two close parallel planes, accenting the contour lines rather than volume and effects of light and shade. This development of the tendency toward frontal representation is characteristic of many late Hellenistic works, but not of the "Alexander" of Magnesia ad Sipylus, the *Aphrodite* of Cyrene, the Pan and Daphnis, nor the works of the followers of Pasiteles. A more typical example of frontal representation is the crouching Aphrodite drying her hair (PL. 366), a product of late Alexandrian Hellenistic art, modeled with a most delicate sense of light and shade. The chest, the turned head, and the legs, in profile, are all represented in the same plane. In the *Three Graces* (Siena, Mus. dell'Opera del Duomo; Vat. Mus.; Cyrene) the three tender bodies are aligned side by side, linked by the skillful crossing of their arms. The reelaboration of Pan drawing a thorn from the foot of a satyr (Vat. Mus.; Ostia, Mus. Ostiense) is another example of frontal representation; the volumes are so flattened and the figural elements so fluid that the work acquires the character of a veritable arabesque. In another example, the unusual Pergamene group of the liberation of Prometheus (Berlin, Staat. Mus.), the detached figures of Prometheus, Herakles, and the personification of the Caucasus seem to be crushed against a background. (If it is correct to identify Mithradates VI Eupator in the figure of Herakles, the work can be dated about 80 B.C.)

The classicizing tendency gave a strong impetus to the work of the so-called "Neo-Attic" artists (see NEO-ATTIC STYLES). Neo-Attic production must have been in full development by the end of the 2d century B.C. or the first decades of the 1st, since the ship that was wrecked at Mahdia on the coast of Tunisia about 80 B.C. (the remains of whose cargo have been recovered) carried several of those marble craters and candelabra which Neo-Attic artists produced in such quantity. With Neo-Attic production the craft of copying works of ancient art greatly increased because of the growing demands of the Romans. This craft had been initiated in the preceding period of the Hellenistic era for the Greek market. The new production of copies was largely centered in Attic workshops, although those in Delos, Ephesos, Pergamon, southern Italy, and, later, Aphrodisias (which was to have particular success in the 2d century of our

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

era) were also important. This production was a result of the growth of classicizing trends, especially Atticizing ones, which had a predilection for types and styles of the 5th and 4th centuries B.C. Retrieved from a ship that sank at Piraeus in the 1st century of our era were other Neo-Attic reliefs, with the customary repertory of Charites, nymphs, abduction scenes, contests for tripods, and so on. The term "Neo-Attic" has also been applied to those sculptors, Athenians for the most part, who in 100 B.C.–A.D. 100 copied or reelaborated Greek originals. It is not always certain when "copies" from the Roman age are Neo-Attic reelaborations and when they are copies of unknown originals. Furthermore, aside from copying and adapting earlier works, Neo-Attic sculptors must also have created more or less original works. Thus, it is often difficult to decide whether sculptures signed by these Neo-Attic artists are to be considered originals or copies (e.g., the two previously mentioned statues signed by the Athenian Apollonios, son of Nestor). With these Neo-Attic artists must be associated the group of sculptors called Pasitelean after Pasiteles, their master, who was born in southern Italy and obtained Roman citizenship in 89 B.C. Stephanos, a student of Pasiteles, signed a statue of a nude youth (X, PL. 262) which is a reelaboration of a type of the late archaic period. Stephanos' pupil Menelaos, who lived in the Augustan age, signed a sculpture, "Orestes and Elektra" (X, PL. 262), reproducing 4th-century sculptural types. The homeland of Arkesilaos (Arkesilas?), an artist contemporary with Pasiteles and related in his work, is unknown. (Some scholars suggest Cyrene.) Like Pasiteles, Arkesilaos prepared clay sketches for his sculpture which were very much sought after and sold at high prices (Pliny, *loc. cit.*, 155). He executed the statue of Venus Genetrix ordered by Caesar for the temple in his forum (*loc. cit.*, 156), that of Felicitas commissioned by Lucullus (*loc. cit.*), a marble group of a lioness with cupids, which Varro was proud to own (*loc. cit.*, 41), and the centaurs with nymphs owned by Caius Asinius Pollio (*loc. cit.*, 33). It is believed that a derivation of this last group can be recognized in the previously mentioned Triton with Nereid in the Vatican Museums.

Akin to the return to classic ideals was the archaic revival (the so-called "archaizing" or "archaistic" current), which also spread in the late Hellenistic age. This manner was employed particularly by Neo-Attic artists and resulted in eclectic works which combined a classicizing and archaizing repertory. There had been an archaizing current even before the 2d–1st century B.C. For example, not to mention even earlier precedents, it is frequently found in work of the 4th and, even more, of the 3d century B.C. Aside from Panathenaic amphoras, it is evident in the reverse side of coins of the Diadochi, in several Attic reliefs of the 3d century, and in the elegant bronze herm from Mahdia (3d–2d cent. B.C.), signed by Boethos of Kalchedon (Chalcedon), which served as a support for a statue perhaps to be identified in the figure of a winged youth (Agon) from Mahdia. The archaistic reliefs of the 2d–1st century often repeat the ancient types, treating them with a strong sense for refined decorativeness. Examples include a candelabra base in Dresden with the contest for the tripod (X, PL. 265), the Sosibios amphora (X, PL. 264) with figures of divinities, the reliefs of the so-called "Kitharoidos" (Apollo, Artemis, Latona, and a nymph pouring a libation; Berlin; Louvre), and reliefs of nymphs (Rome, Cap. Mus.). Archaizing statuary was produced less frequently and was of poorer quality; examples include the Villa Albani kore, the Pompeii *Artemis*, the Herculaneum *Athena* (Naples, Mus. Naz.), and the Louvre *Athena*.

The general characteristics of Neo-Attic art, then, are a meagerness of invention, a mannered decorativeness, frequently of high quality, and a classicizing and archaizing eclecticism. Themes and forms proper to the Hellenistic age appear less frequently but are not lacking. Examples of the work of Apollonios, son of Nestor, and of Agasias of Ephesos have already been considered; to these may be added some imposing marble cups with Nereids and Tritons, satyrs and maenads, and acanthus leaves, all in high relief (Rome, Mus. Naz. Rom. and Mus. Torlonia). There is also a marble skyphos (formerly in Rome) decorated with animals and sea monsters that is richly modeled and entirely Hellenistic in idiom. It has often been said that Neo-Attic art was a Roman art because it flourished largely on Italian soil and catered to the needs of Roman clients in a new cultural and political environment which had its center in Rome, rather than in Greece. The continuity (evident in so many things) from the classicizing eclecticism of the second half of the 2d century to that of the Neo-Attic artists, and the abundant historical data showing the ceaseless flow of Greek works, artists, themes, and forms to Rome between the 2d and 1st centuries, define the character of this Neo-Attic Roman art. It contained no elements which were not genuinely Greek, and it may be considered the end of the creative cycle of Greek sculpture. The fact that this culmination was achieved in the new capital of the ancient world shows the power of expansion which Greek art continued to have even in the hour of its decline.

TERRA COTTAS. The tendencies of Hellenistic art are variously reflected in the production of terra-cotta figures, which continued abundantly and spread in a multiplicity of manufacturing centers. The stylistic history of these products of industrial art parallels that of large-scale sculpture. Inspired by a feeling for delicate grace and elegance, the draped female statuette was the most popular type of work. The artist working in terra cotta employed great variety in the arrangement of drapery and in the poses and gestures. The figurines were often given a wide hat and were always brightened by lively coloring. Other popular themes included children, male personages, and certain divinities and demigods, especially Aphrodite, Herakles, Nike, Eros, satyrs, and local divinities; there were representations of animals and single objects as well. Frequently two or more figures were grouped together. Genre and caricature were extremely popular in all the arts of the Hellenistic age. Peddlers, fishermen, peasants, dancers, jugglers, servants, students, pedagogues, as well as deformities of every description were portrayed. These subjects found their greatest variety and often their highest quality in small terra cottas and bronzes. Portraiture was less common. At a certain time (especially in such workshops as that of Smyrna) ancient masterpieces began to be reproduced also in reduced proportions in terra cotta. This terra-cotta work is known almost exclusively from discoveries in tombs, but it is certain that such copies were also made to decorate habitations and, in many cases, to serve as votive offerings. The most famous centers of their manufacture (and excavation) are Tanagra (Boeotia) and Myrina (Asia Minor); numerous other centers, often of great importance, include Athens, southern Italy and Sicily, Etruria, Smyrna, Tarsos, Priene, Cyrene, the Pontos, Alexandria, Lebanon, and Syria. Evidently the principal centers influenced the minor ones, and a kind of common artistic language was established, while the local character of the centers asserted itself in varying degrees.

The Tanagra production (PL. 194) began toward the end of the 4th century B.C. and continued into the 3d. It echoes the elegance, grace, and harmonious rhythms of 4th-century sculpture, especially that of Praxiteles. The Tanagra works were soon exported and imitated in many centers; with the passing of time the style of these works changed according to the tastes current in large-scale sculpture. The workshops of Myrina were active from the end of the 3d to the 1st century B.C. In their diversity of styles and rich repertory of subjects, they perhaps reflect Hellenistic taste more completely than do the factories of Tanagra. The other factories developed their various activities at different times, often continuing old traditions of the local industries. Elsewhere, especially in the eastern Hellenized centers, new industries were created which established deep roots, as in Egypt; to purely Greek work they added works of an eclectic character, often of great cultural interest even if of mediocre quality, reflecting local tastes and traditions.

As is well known, in Greek antiquity terra cotta was widely used not only for small statuettes but also for large-scale sculpture. In the Hellenistic age this practice, which in 4th-century Greece seems to have been completely abandoned, was resumed. Examples of large and medium proportions have been found in Tegea, Praisos, Kerkyra, Thera, Tralles, Thessaly, and especially Smyrna. But the centers where production was by far the most extensive and where Hellenistic concepts were joined

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

to continuous local traditions were those of Italy, especially those of Etruria and Latium. Here terra cotta long continued to be used for funerary and cult statues, sculpture for architectural decoration, portrait heads and busts, sarcophagi, and other works. Although many of these works have a clearly local stamp, especially the portraits, others can be considered purely Greek Hellenistic creations [e.g., terra cottas of the "Scasato" temple at Falerii (Civita Castellana); pediments of the temples of Telamon, Luni, and Civitalba (V, PL. 54); some heads from Arezzo; architectural sculptures from S. Gregorio Magno in Rome]. This production, even more than that of small works, justly belongs to the vast field of Hellenistic sculpture.

PAINTING. *The problem of Hellenistic painting.* Literary sources in the field of ancient painting are rich for the 5th and 4th centuries B.C., but they give little information on the Hellenistic age. This period, nonetheless, bears a certain advantage over the preceding one, because a considerable number of actual paintings are preserved, even though they may be fragmentary or inadequate. Some were executed in the Hellenistic age; others date from the beginning of the Roman Imperial period but are still within authentic Hellenistic tradition, being either copies of or derivations from Hellenistic works. The documentation consists, above all, in the extraordinarily rich patrimony of wall painting in the cities buried by the eruption of Vesuvius in A.D. 79, and in the smaller number of paintings of great importance in a few isolated houses and villas discovered in Rome. Aside from these there are single works found in various parts of the Greek world, for the most part of modest quality.

The Romano-Campanian wall paintings are products of an area of the ancient world that was profoundly Hellenized, even though geographically far from the major Hellenistic centers of production, and they share the same conventional chronological distinctions. Much debated and still unsolved is the problem of their value for the knowledge of Greek painting, and of Hellenistic painting in particular. Some consider them to be decorative wall paintings of the Roman period, but deriving from Hellenistic traditions and therefore of concrete, though often indirect value for a knowledge of Greek painting. Others consider them Roman and Italic paintings, possessing their own merits but of no value for even indirect understanding of Greek or Hellenistic painting. But the best and largest part of Romano-Campanian painting is indisputably an expression of Hellenism and is completely within the Hellenistic tradition. It is an Italic Hellenism, rather than Pergamene or Syrian or Alexandrian, but it remains Hellenism, whatever its Italic components may be. The defense of the paintings of the Villa of Boscoreale, or those of the Villa of the Mysteries (Villa Item), or the yellow monochrome of the House of Livia, as Italic or Roman products can be at most a defense of their autonomy in respect to the works of other Hellenistic centers; but Hellenistic they remain. Although in certain cases one can dispute the dependence of Romano-Campanian paintings on models of Greece or the Hellenized Orient and find in them testimony of more purely Roman taste and stylistic sensibility, in so doing one must bear in mind certain incontrovertible facts. These facts are: the certain existence in Romano-Campanian painting of copies of older works; the uneven quality of the paintings; the many reminiscences, in subject and figural repertory, of the eastern Hellenistic world; the heterogeneity of the figure paintings; and the equally certain existence of a folk-art style (completely different from that which is called "Hellenistic" or "Hellenizing"), which, together with comparable sculptural works, seems to be directly descended from a style that is Italic-Roman in the strict sense of the term.

Other works useful for the study of Hellenistic painting are: a few isolated wall paintings (a panel from the Mustafa Pasha tomb in Alexandria; paintings from Naousa in Macedonia; from Delos; from Kazanlik in Thrace, PL. 48); a few painted steles and loculus slabs (Alexandria, PL. 190; Sidon; Pagasai; Amathous; Lilybaion, mod. Marsala); various figured mosaics (Pergamon, Egypt, Delos, Pompeii, Praeneste, etc.); painted marble tablets from Herculaneum and Pompeii; and for the study of certain individual pictorial tendencies, a few types of painted vases (e.g., the Hadra type and the type from the west slope of the Acropolis).

*Schools and styles according to the literary sources.* On the basis of the written tradition (literary and epigraphic texts) it is believed that four principal schools of Hellenistic painting can be distinguished: Sicyonian, Rhodian, Pergamene, and Alexandrian. It must be remembered, however, that some artists of the second half of the 4th century — Apelles (q.v.), Pamphilos, Nikias (q.v.), Antiphilos, Theon of Samos, and Philoxenos of Eretria — worked on into the beginning of the Hellenistic period and surely gave direction to certain styles. The names are known of some Hellenistic artists who continued the 4th-century Sicyonian school: Timanthes, Nealkes, Anaxandra, Erigonos, Pasias, and Leontiskos. This school had its greatest flowering in the period of Aratos (276–213 B.C.). Timanthes (the grandson of the 4th-century Timanthes who is considered the founder of the Sicyonian school) painted a lively picture of the 241 B.C. victory of Aratos over the Aetolians at Pella. From the sources it can be inferred that Nealkes did small paintings (perhaps genre) as well as large battle scenes (naval battle between the Persians and Egyptians) and figure paintings (Aphrodite). The anecdote recounted by Pliny (*Naturalis historia*, XXXV, 104), that Nealkes threw a paint-soaked sponge at the picture in exasperation at not being able to convey the effect of the foaming mouth of a horse, and thus achieved the desired result, indicates that the impressionistic use of spots of color was accepted in his painting. A detail which he introduced into his picture of the naval battle — a crocodile lying in wait for an ass who drinks at the banks of the Nile — probably has no allegorical significance (the Greek *onos*, ass, has been interpreted as a satirical allusion to Artaxerxes III Ochos, and the battle thus identified as that fought between the Persians and the Egyptians in 350 B.C.); more likely it merely reveals this artist's taste for the episodic and marks the beginning of those scenes of life along the Nile which were to give a special aspect to Alexandrian painting. A similar motif is, in fact, found in a Pompeian painting in which the figures are Pygmies (V, PL. 195). Nealkes, like Antiphilos, should probably be considered one of the initiators of Alexandrian painting. He had a school to which his daughter, Anaxandra, apparently belonged, as well as the painters Erigonos, Pasias, and Leontiskos. Such minor painters as Mnasitheos and Xenon appear to have belonged to the Sicyonian school. Two other factors indicate a relation between the Sicyonian and Alexandrian schools in the period of the first Ptolemies: the presence in Ptolemy II's famous Dionysian festal tent of paintings of the Sicyonian school (Athenaios, V, 156e), and the gift made by Aratos to Ptolemy II of works by Sicyonian painters, especially Pamphilos and Melanthos (Plutarch, *Aratos*, 12, 3). Less is known about the Rhodian school, perhaps founded by Protogenes. Testimony for its existence is the coincidence of the names of painters recorded in written sources with those of sculptors known to be Rhodian: Mnasitimos, Aristonidas, Tauriskos, Philiskos, and Simos. Knowledge of the existence of a Pergamene school of painting rests on a firmer basis: the passion of the Attalids for this art is known. Attalos II paid large sums for the acquisition of original works and was interested in procuring copies of others. Three painters are mentioned in an inscription at Delphi as having been sent by the Attalids to make copies of paintings: Kalas, Gaudotos, and Asklepiades (?). Further, there is recorded (Pausanias, I, 4–6) a painting representing the victory of the Attalids over the Gauls (also commemorated in the sculptural dedications). There is also recorded the name of a painter, Pytheas, who did a wall painting at Pergamon representing an elephant, and of two mosaicists active in Pergamon, Sosos and Hephaistion. To this is added the strong possibility that some Pompeian works may be recognized as Pergamene in style: *Herakles and Telephos*, *Herakles and Omphale*, etc.

Of the Alexandrian school there is known an Egyptian painter, Antiphilos, a contemporary of Apelles, who worked with Apelles for Ptolemy I Soter. Although there is no record of painters who trained in his school, from the fact that he was Egyptian and worked in the court of Ptolemy, and from

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

what is known of his art, it may be inferred that he was the leader of the Alexandrian school of painting. A versatile artist, he must have enjoyed great fame even posthumously (a number of his pictures were in Rome in the porticoes of Philip and Octavia); he painted both in encaustic and in tempera (Pliny, *op. cit.*, xxxv, 138); he did large pictures of mythological subjects (Hippolytos, Dionysos, Hesione, Kadmos, and Europa) and historical ones (Philip and Alexander, Alexander as a child, Ptolemy hunting); he was fond of genre subjects and caricature. The *facilitas* which is mentioned by Quintilian (*De institutio oratoria*, xii, 106) as a quality of his art has been identified with the fast, sketchy (in this sense impressionistic) manner that seems to have become traditional in the Alexandrian school (*compendiaria*; Petronius, *Satyricon*, 2, 9); the genre subjects and caricature cultivated by Antiphilos seem also to have become typical of Alexandrian art. Antiphilos was perhaps one of the first Greek artists to take subjects from the repertory of Egyptian art. His caricatures, which traditionally came to be called "grylloi" (Pliny, *loc. cit.*, 114), were probably related to the Egyptian tradition of animal caricatures. Antiphilos, like other contemporaries (Aëtion), seems to have been interested in the representation of interior scenes (painting of the wool spinners, and especially that of the child blowing a fire, Pliny, *loc. cit.*, 138). The second work was admired for its effects of light, a quality that reappears in Roman decorative paintings which for other reasons have been considered to be of Alexandrian derivation or inspiration. Other Alexandrian painters recorded by ancient authors are: Helen, daughter of the Egyptian Timon, who lived in the late 4th century B.C. and whose *Battle of Issos* was in Rome in the Temple of Peace (the possibility is not to be excluded that she was the painter of the original from which derives the famous Alexander mosaic, usually attributed to Philoxenos of Eretria); a painter named Galaton, possibly of the period of Ptolemy IV (221–203 B.C.), who is recorded to have painted a unique allegorical satirical subject (Homer in the act of vomiting with some poets consuming his refuse); a certain Demetrios, a contemporary of Ptolemy VI (181–145) called "the Topographer" (painter of *topia*, or landscapes, a genre which seems to have been characteristic of the Alexandrian school); a painter of whom is known no more than the name, Polemon of Alexandria (Pliny, *loc. cit.*, 146); and finally, a painter Euanthes (uncertain date), whose two pictures in the Temple of Zeus Kausios at Pelusium in the Delta (Perseus freeing Andromeda, and Herakles rescuing Prometheus) were rather fully described by a late writer of romances, Achilles Tatius (*Erotici scriptores graeci*, I, p. 93 ff., Γ, 6–8, ed. Hercher, Leipzig, 1858). Although the reliability of this source is frequently doubted, some (Rizzo) feel that confirmation lies in the singular correspondence between the description of the rescue of Andromeda and Pompeian paintings of the same subject. Probably also belonging to the Alexandrian school is Serapion; between the 2d and 1st centuries B.C. he painted large compositions with landscapes and architectural views for the *moeniana* of the *tabernae veteres* in the Roman Forum (Pliny, *op. cit.*, xxxv, 113).

Other painters of the Hellenistic period worthy of mention are: Artemon (3d century), whose paintings of Danaë and the Pirates, of Herakles and Deianeira, and of Laomedon with Herakles and Poseidon may be reflected in Pompeian paintings; Metrodoros of Athens, philosopher and painter, who was taken to Rome by Aemilius Paulus, the victor over Perseus of Macedonia (168 B.C.), to educate his children and paint his triumph; Timomachos of Byzantium, from whose paintings of Medea and of Iphigeneia in Tauris certain Pompeian examples might derive; and finally, Apatouros of Alabanda, who painted the stage decoration for the Ekklesiasterion at Tralles, which is described in a famous passage by Vitruvius (vii, 5, 5) and seems to have been very like late Style II Pompeian painting.

*General characteristics.* The taste and styles which developed and spread during the Hellenistic period existed in germ in 4th-century Greek painting. According to what can be reconstructed from the written sources, the painters of the two major schools of the 4th century, the Sicyonian and the Attic-Theban, had already tackled the themes and pictorial problems which were to become familiar in Hellenistic art. The Hellenistic preference for garlands and still life has a precedent in the 4th century in the work of Pausias, who painted wreaths and garlands of flowers. Likewise, the advanced research in color, chiaroscuro and light effects, bold foreshortening, and representation of interiors was already found in the pictures of Apelles, Pausias, Nikias, and Aëtion (not to mention those 4th-century painters who continued to work in the Hellenistic period); while Nikomachos, and to a greater extent his pupil Philoxenos, practiced a rapid kind of painting, perhaps even using spots of color, which later must have seemed (and may even have been) a forecast of the Hellenistic *compendiaria* painting. The forceful movement and the impetuousness of certain of Apelles' and Theon's figures perhaps foretold the taste of the Asian baroque, while Antiphilos and Peiraikos (trained in the 4th century but working into the Hellenistic period) cultivated two types of painting which were particularly popular in the Hellenistic period: caricature and still life.

Although it is possible to recognize this continuity between 4th-century and Hellenistic painting in the literary sources, it is not possible to follow the development, or to grasp the differences between them (or those among the various phases of the Hellenistic period itself); nor is it possible to be completely aware of the contrasting currents which must have existed in painting. In any case, it is certain that only in this period was the use of color completely mastered; further, that the representation of space, hinted at by 4th-century artists, became an illusion of space only in the Hellenistic age, with an increasingly fine understanding of linear and aerial perspective; and finally, that the new taste for minute realistic observation and feeling for nature must have given rise to expressions especially characteristic of the new age.

Painting on a large scale — *megalographia* — continued in major historical and religious compositions and in cycles of single pictures (perhaps arranged on walls): the battles of Alexander, by Philoxenos and Helen; the paintings of battles against the Gauls at Pergamon (Pausanias, I, 4–6) and at Athens (W. Dittenberger, *Sylloge inscriptionum graecarum*, 3d ed., Leipzig, 1915–24); the battle of Marathon, of the Attic school, perhaps reflected in Roman sarcophagi; Nealkes' painting of the battle between the Persians and the Greeks; the victory of Aratos over the Aetolians, by the younger Timanthes; the originals of the *megalographiae* of the Villa at Boscoreale and the Villa of the Mysteries (Villa Item). Also on a large scale were minor compositions, easel paintings, as apparently were most of the "pictures" recorded in the literary sources, which must have been the originals behind many Romano-Campanian paintings. Pictures of small proportions also became popular; these were mostly genre vignettes (VI, PL. 57), still life, animals, and caricature. Painting of this type had its own specialists: Peiraikos, Kalates, Kallikles, and Simos; but in keeping with the taste of the time, it was cultivated as well by painters of large pictures (for example, Antiphilos).

Hellenistic painting played a primarily decorative role in houses and theaters and an illustrative role when books came to be illustrated. As it was varied in its tasks, it must have been extremely varied in style. There was a taste for grandiose baroque forms as well as for delicate miniature, for the dramatic as well as the idyllic, for idealization as well as for realism intensified to caricature and scurrility. The human figure remained the center of interest, but there was a new and more intense feeling for nature which created, as has been said, two new genres: landscape and still life. The paintings which once enriched the palaces, the sanctuaries, the public buildings, and the houses of the large new Hellenistic cities no longer exist; the monuments of ancient painting preserved by the Roman world acquire that much more interest.

*Copies, derivations, and reflections of Hellenistic pictures in Romano-Campanian figure paintings, with descriptions of various Hellenistic pictures.* Through Pompeian copies and variations are known a few important pictures which give quite a reliable idea of the stylistic tendencies of the very early Hellenistic age, or the late classicism of the 4th century. These are the paintings

of "Theseus the Liberator," a few paintings with subjects drawn from the Iliad, and the mosaic of the Battle of Alexander. In the painting of Theseus as liberator, the best copy being that from the basilica at Herculaneum, the figure of the hero (which echoes the ideals of 4th-century sculpture, especially that of Lysippos) occupies almost the entire height of the picture and is placed against a rather simple background that suggests the door of the labyrinth. The subject, highly spiritual content, simplicity and balance of composition, and pictorial scale are still within the taste of the classical tradition.

Of the many Pompeian paintings with subjects from the Iliad the question has arisen whether these pictures (and if so, which) might go back to the *Bellum Iliacum pluribus tabulis* by Theon of Samos (an artist active between the end of the 4th century and the beginning of the 3d), which was taken to the Portico of Philip in Rome (Pliny, *op. cit.*, xxxv, 144). The most important of these Pompeian paintings represent Achilles with the daughters of Lykomedes, the contest between Agamemnon and Achilles, the delivery of Briseis, and the departure of Chryseis. There is an obstacle to the hypothesis that these paintings have a common derivation from Theon's cycle, for there are stylistic differences between them which cannot be attributed entirely to the copyists. It nevertheless seems certain that the originals belonged to the second half or last decades of the 4th century B.C. While the painting of the delivery of Briseis seems closer in conception, composition, and color range to classical ideals, the paintings of the contest and of Achilles on Skyros are in Hellenistic taste and are perhaps closer to what can be deduced from the sources about Theon's art, in the rush of movement, the vivacity of the colors, and the greater complexity of the composition. The painter who decorated the upper wall of the cryptoporticus of the House of the Cryptoporticus in Pompeii must have derived his fine compositions from another Iliad cycle. It is believed that three works of an admired artist of the early Hellenistic period can be recognized in Pompeian derivations: a Herakles and Deianeira, a cycle with the legend of Laomedon's encounters with Herakles and Poseidon, and a painting of Danaë and the pirates. In the first two the identification is more certain, as they have stylistic qualities which can be connected with the early Hellenistic period, and there are singular analogies between them in the modeling of the figures and the use of certain compositional schemes, even though the picture of Herakles and Deianeira seems to be enriched, in the copy, with landscape elements inconsistent with the original. The cycle of Laomedon, in a room in the House of Loreius Tiburtinus, is of particular importance; if it is true that it derives from a pictorial cycle of the beginning of the 3d century, it is an example of continuous narrative anterior to the Telephos frieze of the Pergamon altar.

A painting dating from the beginning of the Hellenistic period is known through the famous mosaic of the Battle of Alexander (PLS. 154, 155). The original must have been very famous, as even reliefs derive from it (3d–2d century B.C. to 2d century of our era). The mosaic itself dates back to the 3d or 2d century B.C. and is one of those which can be considered an importation from some center of the Hellenistic east (Alexandria?). The artist selected a highly dramatic episode of a battle between Darius and Alexander (almost certainly that at Issos, in 333 B.C.): the Macedonian has almost succeeded in overtaking the fleeing Persian, but he lances not Darius himself but a faithful follower (Oxathres?) who has thrown himself to the defense of his king. The composition of the painting, although without background and articulated with only a few successive planes, is highly effective in creating the impression of the crowd; bold foreshortenings create convincing effects of depth. The polychromy is still quite simple, based on the use of four main colors — yellow, black, white, and red — with frequent passages of intermediate tones. An important and prophetic innovation is the use of chiaroscuro to obtain the effect of relief and of light; in spite of this, the picture remains primarily light in tone, the only contrast being afforded by the black masses of the horses.

Attribution of the Battle of Alexander to Philoxenos of Eretria, of the Attic-Theban school, is almost unanimous. He did indeed paint a Battle of Alexander which was greatly praised by Pliny (*loc. cit.*, 110), and on the basis of this atribution the original of the Hunt of Alexander, which is known from a mosaic in Palermo, is assigned to the same master. The hypothesis that Helen might be responsible for the famous painting has been presented several times (Rizzo, Bianchi Bandinelli); however, the difficulties with this rather hesitantly put forth attribution are a lack of confidence in the source which speaks of the lady painter (Ptolemaios Hephaestion, in Photios, *Bibliotheca*, ed. Hoeschel, p. 482) and the reluctance to attribute to a woman such a major and vigorous work. The objections are not invalidating; moreover, there are stylistic difficulties which render the usually accepted attribution to Philoxenos doubtful. The principal problem is to reconcile the quality of *caeleritas*, in which Philoxenos seems to have surpassed his own master Nikomachos, and his *compendiaria* technique, with the firm and often precise and minute manner in which the picture of the battle appears to have been painted. In any case, this work remains a certain and valuable testimony to the fact that even at the threshold of the Hellenistic period Greek painting tended to be more concerned with the effects of color and light than with drawing.

There is a painted marble slab from Pompeii with a scene of the slaughter of the Niobids, which has almost completely lost its color; the careful preparatory drawing, however, is preserved except for a few areas. (The condition of some painted steles from Alexandria is similar.) The picture seems to have been composed of only two groups of figures: Niobe with her arms around one daughter, and the old nurse who rushes to the aid of a dying girl. The scene is placed before an architectural background arranged in overlapping planes like stage scenery; the treatment of space is similar to that in the stele of Hediste (discussed below). A long spear crosses the entire picture on a diagonal, creating a sense of depth. The work shows exceptionally fine execution and certainly derives from a painting by a great master of the end of the 4th century or the first half of the 3d (regardless of doubts that have been raised). In addition to baroque accents, one sees in it the tone of the Scopasian style vital and influential in the early Hellenistic period.

Classical traditions, infused with completely Hellenistic taste, survive in a 3d-century painting which Pompeian decorators copied and varied many times: the appearance of Dionysos on Naxos. There is reason to believe that the copy in the House of the Citharist is substantially faithful and best conveys the high quality of the original. The classical nobility of the figures is accompanied by a spatially rich composition, a feeling for nature, and an idyllic, sensual tone which are entirely Hellenistic. The picture displays a masterly command of drawing; its color scale is delicate, and there appear soft reflections of the light which enters the picture from below. The painting has been thought to reflect the currents of the Pergamene baroque, but it seems rather to belong to the late-3d-century style of Greece itself, perhaps Attica, because of its quiet sense of equilibrium and measure. The idyllic tone which infuses the secondary groups in the picture brings to mind another of those paintings on marble which have been found in Pompeii and Herculaneum: that from Herculaneum, showing a tired Seilenos resting on the Acropolis and receiving a drink from Prokne and Philomela. The scene is localized by the statue of the Palladion on a pilaster, and by an olive tree (the olive tree of the Acropolis); a sense of depth is conveyed by the oblique position of a donkey. The picture is an extremely fine work; here too the color is lost, but the misty shadows which remain indicate a more elaborate pictorial technique than is found in the other monochromes on marble, with a greater fusion of colors and perhaps *sfumato*. It would be hard to place the original, perhaps Attic, earlier than the end of the 3d century.

A group of four admirable small pictures were found in a room in Herculaneum stacked one against the other as if they were executed as independent panels or perhaps cut out of a fallen wall (damaged by the A.D. 63 earthquake?) in order to be re-used. They are faithful copies of Greek originals, perhaps votive paintings, to be dated in the last years of the 4th century or the beginning of the 3d (some even date certain ones of them in the 2d century). The fact that they were saved for re-use shows how highly the panels were valued. Interior scenes

are represented: a young girl being dressed; the "ex-voto of the tragic actor" (PL. 191); a concert; a couple of young heroes (Achilles and Patroklos?). The first two are the best in quality and preservation, particularly the second, because of its aristocratic conception and its sure rapid execution, reflecting a more advanced taste than the others. Styles similar to these, and especially to that of the dressing scene, are found in some of the small shuttered pinaces which are represented in Style II decorations and which are among the most faithful copies of Hellenistic paintings. The subjects of these pinaces, which imitate wooden panel paintings with shutters, are completely Hellenistic in taste (erotic scenes, still life, religious ceremonies done in genre style; a few will be discussed below). Worthy of mention are those in the House of the Farnesina in Rome (an erotic scene, also reproduced in a mosaic from Centocelle now in Vienna) and in the House of Livia on the Palatine (a ritual scene in an interior). Here too the colors are in the delicate scale that was popular in early Hellenistic painting.

Certain painted grave steles that have been found in various places [Alexandria (PL. 190), Pagasai (PL. 48), Cyprus, Sidon, Lilybaion] are Hellenistic originals of the 3d and 2d centuries B.C. Although these and the painted loculus slabs from Alexandria are of little or no artistic value, they are often very important documents because they are the only sure evidence (though often only approximately dated) of the tastes and styles of Hellenistic painting and are frequently useful as a basis of comparison in singling out reflections of Hellenistic painting in Romano-Campanian products. The most famous of these steles, that of Hediste from Pagasai (Demetrias), gives an idea of the representation of interiors in the last decades of the 3d century B.C. In the foreground a woman in childbirth, perhaps dying, reclines on a *kline*; her husband stands near; behind are two wings of a wall, behind one of which appears the nurse holding the newborn child in her arms. In the background beyond a pair of pilasters and seen through a half-open door is a woman who looks into the room. This modest but dated monument has many of the elements found later in Pompeian painting: the *naiskos* composition, which is seen again, for example, in the panels from Herculaneum, mentioned above; the plain band at the base, which is also present in the Alexander mosaic and in mosaics by Dioskourides; the schematic representation of an interior by means of overlapping panels like those of a stage set, found again, though with greater complexity and variety, in the Herculaneum panels and other Pompeian paintings. There is some evidence that the interest in representing an illusionistic view beyond a wall opening, such as is the basis of the so-called "Pompeian Style II," already existed in the 3d century (the Alexandrian loculus, slabs of Philoteknos, of Stephanos, and of Helixo). The figures are often executed in a rapid pictorial manner, with spotting of the paint, which corresponds to that of some Hellenistic ceramics (the vases from Hadra and other sites) and gives an idea of the *compendiaria* painting which ancient writers attributed to the Alexandrians (Petronius, *Satyricon*, 2, 9). Two rare Hellenistic wall paintings found in tombs are of great interest, one in Naousa (Macedonia) and the other at Alexandria (Mustafa Pasha); both belong to the early Hellenistic period, the second certainly to the 3d century. In the first a horseman spears a barbarian; the figures, placed against the ground with no indication of setting, are executed in a dry and nervous style, full of movement, and in a color scale limited to yellow, red, green, and blue. The work cannot help but recall the central motif of the Alexander mosaic. A different style is to be found in the paintings of three horsemen, alternating with two sacrificing women, which decorated one of the tombs of the necropolis of Mustafa Pasha at Alexandria. The background here too is completely neutral and originally was painted blue. The three horsemen are particularly noteworthy in the boldness of the foreshortening. Nonetheless, the coloring (which must have been the traditional yellow, light red, dark red, blue, and perhaps white), the style of the female figures, so restrained and simple in their outlines, and the elegant, nervous lines of the horsemen cannot be related to the baroque manner — as has been done — especially in view of the fact that the broad outlines which increase the mass of the figures are part of the crude brown preparatory drawing and were meant to be covered by the blue background paint. Richer and more elaborate, but in a somewhat provincial style, were the decorations of the walls and vault of the tomb at Kazanlik (Thrace, now Bulgaria; PL. 48), belonging to the decades about the end of the 4th and beginning of the 3d century (scenes of battle, chariot races, and a funeral banquet).

Pompeian paintings of Medea meditating the murder of her children (X, PL. 245) and of the arrival of Orestes and Pylades in Tauris probably preserve reflections of works of a famous artist recorded by Pliny, Timomachos of Byzantium. The copies which seem closest to the originals are the famous fragment of the Medea from Herculaneum and the painting of Orestes and Pylades from the House of the Citharist in Pompeii. The pictorial schemes of these works were used in various other monuments of the Roman period. The stylistic qualities of both undoubtedly bespeak an art close to the ideals of the classical age. In the compact figure of Medea, so powerfully dramatic, are the intense inner fire and strongly centralized rhythms of the sculpture of the first decades of the 3d century and an accentuation of pathos which presages the baroque. This is indeed in contrast to the date in the period of Caesar assigned to the painter by Pliny (who mentions another painting by him, of Ajax). If this generally accepted attribution is correct, then Timomachos was merely a felicitous evoker of the forms of the past; otherwise Pliny erred. The stylistic quality of the two works favors the second alternative and suggests that Timomachos was a painter of the early 3d century B.C.

Two famous mosaic panels by the Samian mosaicist Dioskourides, found in Pompeii in the Villa of Cicero, reflect originals belonging to the 3d century, perhaps to the first half (strolling musicians, members of the cult of Cybele, PL. 166; a comedy scene of two young women consulting a *pharmaceutria*, or sorceress). The quality of the drawing is not so fine as that of the execution. These mosaics, dated to the end of the 2d century B.C. on the basis of the letter forms of Dioskourides' signature, may be considered faithful copies of their originals and are immediate evidence of Hellenistic painting in a new manner, quite different from the works discussed. The compositions are quite simple, and the subjects and figure types are completely Hellenistic. The particular merit of these two small pictures lies in their use of color. In the rich and varied coloring (one of the richest known in antiquity) are introduced new chromatic elements: iridescence and, in the picture of the strolling musicians (which is also known through another replica from Stabiae), the effect of shadows cast on the ground and on the wall, causing the figures to appear as though in sunlight. The use of color is more advanced than in the Alexander mosaic. Dioskourides' signature includes an indication that he was from Samos, and the figures bear a resemblance to those in the terra cottas from Myrina; neither of these factors, however, is decisive enough to permit the assumption that the originals came from the school of Asia Minor, unless it were to be accepted that Dioskourides was not the mosaic copyist but the creator of the originals.

However, there is other evidence in Campanian painting of reflections of the painting of Asia Minor, and particularly that of Pergamon. Most important is the cycle of nearly life-size figures painted above a dado zone on a vermilion background in a room of the Villa at Boscoreale (PL. 192). The paintings are *megalographiae*, which were characteristic of the second phase of Style II. They were executed about 40 B.C. but reflect, at least in part, 3d-century originals. The best-known sections are those with the figures identified by some as Antigonos II Gonatas, his mother Phila, and his teacher, the philosopher Menedemos of Eretria (Naples, Mus. Naz.); and the one with the figure of a seated citharist and a handmaid standing behind her (Met. Mus.). With these should be included the paintings of Aphrodite and Adonis (?), two winged demons, a young hero with a matronly woman, and a standing woman with a shield (all in Met. Mus.). The interpretation of the cycle is controversial: some have held the so-called "Antigonos" to be Pyrrhus of Epirus, with the personification of a defeated country; the cycle has even been explained as representing various

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

episodes in the story of Aphrodite and Adonis, though this interpretation is unlikely, as at least some of the figures are certainly historical. The artistic value and stylistic significance of the paintings, however, are more important in this context than their interpretation. They show a relation to the earliest baroque style of Asia Minor in the grandeur of the conception, in the broad moving folds of the drapery, and in the strong realism of the heads (though all details are not of the same level of execution, and the heads sometimes have been provincialized in the hands of the copyist). A high level of painting appears in the figure of the woman seated next to the hero ("Aphrodite," so-called) and in the so-called "philosopher" (PL. 192); the latter is full of spirit and energy, vibrant even in the moving folds of drapery and in the hand grasping the gnarled staff. The figures are placed against a continuous background, as might also have been true in the case of the original. Predominantly warm tones of purple, yellow, green, and black are employed, and there is extensive use of chiaroscuro. The originals copied by a very capable decorator in three panels in the triclinium of the House of M. Lucretius in Pompeii certainly belonged to the school of Asia Minor. Two of these are partially destroyed (the triumph of the infant Dionysos on an ox-drawn cart, and Dionysos erecting a trophy), but the third is preserved almost intact in Naples (Mus. Naz.), and represents Herakles enslaved by Omphale. The enormous figure of the drunken hero holding the thyrsos in his left hand, his head crowned with vine leaves, his right arm thrown around the shoulders of Priapos, dominates the center of the picture. To the right is the handsome figure of self-satisfied Omphale, who displays the club and lionskin taken from the hero; at the left and in the second plane are members of the Bacchic thiasos and the court of Omphale. In spite of the note of epigrammatic erudition introduced into the picture by the presence of the three little Erotes [whose positions recall the Erotes in the famous description by Lucian (Herod. sive Aëtion, 4) of the painting of the wedding of Alexander and Roxana by Aëtion], the picture is conceived in a spirit of human sympathy for the defeated hero rather than derision. The formal elements of the composition correspond to the grandiose conception; the powerful, massive bodies occupy almost the entire picture surface, and the color is warm, mainly red, blue, yellow, and violet. Erroneously considered by some to be a creation of the Flavian period, the painting appears to be a faithful copy of a work by a forceful Hellenistic artist who preceded but was certainly a forerunner of the 2d-century baroque. The originals of this and the other two paintings (known mainly from drawings) probably were part of a single cycle.

An original of the Pergamene school itself is believed to be the prototype of the famous painting from the basilica at Herculaneum which represents Herakles with the personification of Arcadia watching in marvel as his son Telephos is nursed by the hind (PL. 193). It is not only the subject which can be traced to Pergamon; some of the figures are very close to those used in the Telephos frieze and to Pergamene statues. A lively feeling for nature may be noted, not so much in the background rocks, but in the allegorical figure of Arcadia, crowned with vines, who has at her elbow a basket containing the fruits of the land, and who is accompanied by a pert young satyr and a mountain nymph. The scene is grand and solemn; the main figures have a sculptural monumentality, and the drapery of Arcadia moves in weighty folds. The composition is organized with great simplicity on two crossing diagonals and a vertical which descends from the staff of Arcadia (Pfuhl). The coloring, dominated by the contrast between the light yellow of Arcadia's garments and the reddish brown of the body of Herakles, is richly varied in tone; if it reproduces the coloring of the original, it indicates a more advanced step in the transition from color to tone in Greek painting. The work is certainly later than the originals of the pictures in the House of M. Lucretius and perhaps belongs to the first decades of the 2d century B.C.

Though nothing is preserved of the painting by Antiphilos of the boy blowing the fire (or the picture of the same subject by Philiskos: Pliny, *op. cit.*, xxxv, 143), which would indicate the interest of the early Hellenistic period in artificial light in interiors, an anonymous Hellenistic original is reflected in the Pompeian painting of Mikon (or Cimon) and Pero. In a dark jail cell Pero nurses her emaciated father Mikon at her breast, while through the bars the guard watches this scene of filial piety. The date of the work cannot be determined, but the painting is perhaps later than the one by Antiphilos. It must have enjoyed great fame in antiquity, as it was copied several times by Pompeian decorators, always, unfortunately, in mediocre versions. That the original must have been a masterpiece is evident even from the copies; despite their inferiority, they display a warm and touching note, and there is an effective simplicity in the paired figures, in which the robust forms of the young girl contrast with the pale, thin body of the father, seen under the rays of light striking through the bars — a singular attempt to render light effects.

The great cycle of paintings in the Villa of the Mysteries (Villa Item) at Pompeii, depicting scenes of initiation into the Dionysian mysteries (PL. 203), is an Italian late-Hellenistic work of the 1st century B.C. Although opinion is divided concerning the value of the cycle, it remains the most impressive pictorial complex preserved from antiquity and certainly derives in part or completely from an older original. There is disagreement as to whether there was a single prototype or several, as to the date of the original (or originals), and especially as to the intrinsic value of the copy, which is considered by some to be a frequently inept derivation of an original of considerably higher stylistic quality, and by others to be a free variation of high quality, notably in the coloring, by a truly masterful Campanian painter. The eclecticism of the single figures and the groups, and the undeniable contrast between the high level of the conception and the inadequacy of the execution suggest that the former judgment is closer to the truth, even though it is granted that the copyist was gifted with singular bravura and an unusual color sensitivity. Compared with the paintings from Boscoreale, those of the Villa of the Mysteries seem to reflect a much more traditional original, perhaps Attic, of the 3d–2d century B.C., from which, despite deficiencies and inconsistencies in execution, the Pompeian paintings certainly preserve some of the more vivid episodes — the flagellation group (PL. 203), the dancing woman, the winged demon, the group of the Seilenos and two satyrs — and transmit more than the echo of Hellenistic painting at a fairly high level.

Pompeian decorators had a well-known fondness for the motifs of crowds of Erotes, represented sometimes with their companions the Psychai, playing games, or engaged in the most varied occupations of daily life, including hunting, gathering grapes, and making shoes or jewelry. That these are Hellenistic motifs is indicated not only by the poetry of that age, but also by a few rare pictorial documents preserved in the Hellenistic east. On a Style I wall at Delos, dated between 80 and 50 B.C., a frieze of Erotes occupies the same position as that in the Style IV House of the Vettii in Pompeii a century later. Even earlier, between the 3d and 2d centuries, motifs of Erotes and Psychai on bigae drawn by deer (frequent later in the Roman art of Pompeii) are found on a painting of a funerary couch decorated with embroidery, covers, and colored pillows in the necropolis of Mustafa Pasha at Alexandria. Reflections of Hellenistic taste, and sometimes more direct derivations from Hellenistic works, can be recognized in other Pompeian paintings of Erotes: the Seller of Erotes, Eros Punished, and the Nest of Erotes. Of this last subject are known four copies of varying quality, the one in the House of the Tragic Poet being exceptionally well executed and probably closest to the original. Aphrodite and Adonis and four young members of their cortege are intently admiring three little Erotes nestling in a wicker basket which Aphrodite holds in the palm of her hand. It may never be possible to determine how close it is to the original composition, or whether the landscape background was added by the copyist (as some scholars have held); but it is certain that the conception of this tender idyll, the ideas of form, especially of some of the particularly beautiful heads, the firmness of the drawing, and the light coloring, which is based on violet, green, and yellow, all are aspects of Hellenistic taste, perhaps of a rather early period.

From what is known and can be reconstructed of 2d-century B.C. painting, it may be deduced that although there was at a certain point a reaction against the grandeur and pathos of the baroque (perhaps toward the middle of the century), the main interests of this period must have been the problems of spatial representation of interior and exterior scenes, the use of a sketchy pictorial technique, and the use of more purely coloristic effects. Landscape painting undoubtedly developed greatly at this time, and perhaps still-life and genre painting as well. The originals of some of the small pictures from Herculaneum that have already been mentioned (Achilles and Patroklos, the player of the double flute, the robing of a young girl) have been dated in this period because of their more elaborate and coordinated system of representing interiors, and certain indications of greater interest in the effects of foreshortening (as in the horse in the picture of Achilles and Patroklos).

The popularity of the sketch, which was already widespread in the 3d century, is seen in some Etruscan tombs, for example, that of the Cardinal at Tarquinia, and the Tomba delle Colle at Chiusi; in the late Panathenaic amphoras; in some vases from Hadra; and in one work of very high quality, the originals of the Odyssey landscapes from the Esquiline (PL. 180), in which the human figure, entirely subordinated to the landscape and almost a part of it, is rendered in a sketchy manner. There are a few works of the Augustan period which exhibit a style of painting with rapid touches and produce lively light effects, such as the yellow monochrome in the House of Livia (which will be discussed at greater length) and a wonderful little overdoor painting which decorated a small room in the Villa of the Mysteries. The author of the famous painting known as the "Aldobrandini Wedding" (a frieze painted in the last decades of the 1st century B.C. for a Roman house on the Esquiline; VI, PL. 57) certainly drew his repertory of figures from Hellenistic painting. The frieze is composed of three groups: in the center, the nuptial bed with Hymenaios and the virgin bride attended by Peitho and Aphrodite (according to a recent interpretation, it may allude to the sacred wedding of Herakles and Hebe), and at the sides, two groups of women who are preparing the rite of the marriage ceremony. The inconsistency in the rendering of space and a certain eclecticism in the representation indicate that this is a Neo-Attic work; nonetheless, it certainly reflects elements of early Hellenistic painting, particularly in the beautiful central part, and perhaps reflects a painting created not long after the famous picture of the marriage of Alexander and Roxana by Aëtion. The excellent figure of Hymenaios seated in a restless, startled attitude echoes somewhat the ideals of Lysippos, and there is an undeniable reflection of the terra-cotta figurines of the early Hellenistic period in several of the female figures. The Aldobrandini Wedding certainly has a prototype belonging to the genre of framed and shuttered scenes of marriage which were copied by decorators of late Style II walls.

Several other eclectic works of the 1st century B.C. are Augustan transformations of Neo-Attic reflections of the high artistic ideals prevalent at the end of the 5th century B.C.; the marble panel from Herculaneum with girls playing astragals (knucklebones; X, PL. 266), signed by Alexandros, an Athenian; and two pictures in niches represented on a wall in the House of the Farnesina (Rome, Mus. Naz. Rom.: Aphrodite and Eros, I, PL. 299; girl pouring perfume). Contrasting with these is another painting in the House of the Farnesina (the infant Dionysos raised by maenads) in which the idyllic tone, the figure types, and the coloring derive from the early Hellenistic period.

*Genre subjects and still life.* Painting in the second half of the 4th century had already treated humble and sometimes sordid scenes of daily life, caricature, and still-life subjects. These were usually pictures of modest or very small format, and they were still eagerly sought after by art lovers in the Roman period. Kallikles, Kalates, Antiphilos, Peiraikos, and Simos are recorded as painters of such pictures (called "ropographia" or "rhyparographia") and are sometimes referred to as the ancient "Dutch" painters. These, together with what is known of Pausias as a painter of flowers and garlands, show again how many of the aspects of Hellenistic painting had already appeared in the 4th century. The work of Chairephanes, a painter of lascivious scenes, has been assigned to the first half of the 3d century (Plutarch, *De audiend. poët.*, 3); his choice of subjects relates him to Nikophanes, who was his master, and to Pausias himself. Although nothing more is known of these so-called "Dutchmen," or of the products of their immediate successors in the early and middle Hellenistic periods, in the earliest Pompeian painting and in late Hellenistic mosaics are numerous and outstanding examples of still life (fruit; flowers; game and fish — sometimes live animals as well as dead; and glass or silver vessels), floral paintings, and scenes of the sea with its fish. These are the immediate and sometimes unsurpassed predecessors of the products of the Roman Imperial period. The work of the Greek artist Possis was approximately contemporary with the oldest examples of Pompeian still life; he was quite famous for this genre of painting in the period of Varro (Pliny, *Naturalis historia*, XXXV, 155).

Still life is found as splendid isolated elements in the Pompeian Style II architectural system and, more often, in the representations of small shuttered pictures. These last are modest craft products, but the fondness for still life is seen also in the polychrome vases from the Alexandrian necropolis of Hadra (III, PL. 137; representations of garlands, a pair of shoes, Panathenaic amphora with palm branches). One of the most famous mosaics from the House of the Faun in Pompeii (PL. 191), dated to the 2d century B.C., represents a still life of which there are two later variations; this is the mosaic with two registers, representing a cat catching a bird, and a pair of ducks between fish, lotus flowers, shells, and a group of thrushes. The original can be no later than the first half of the 2d century B.C. Along with an interest in precise observation of nature and well-defined modeling of form, the mosaic has a fine composition, a strong sense of space, and an intense but sober coloring designed to contrast the figural elements with the various zones of the background. Among the most beautiful examples of still life conceived as decorative elements on Style II walls (not as independent pictures) are the exquisite representations of fish and fowl painted as though hanging against the wall (as on a wall from the Villa of Julia Felix in Pompeii, now in Naples, Mus. Naz.), and a large transparent glass vase filled with apples which was represented on the rear wall of the cubiculum of the Villa at Boscoreale (now in Met. Mus.). In this period among the most beautiful still lifes in the form of shuttered panel paintings are those in the House of the Cryptoporticus at Pompeii (PL. 190).

It is reasonable to believe that even the still lifes reproduced on Style IV walls continue to be substantially faithful copies of Hellenistic originals. Among the most beautiful in their rich effects of light and in the variety and harmony of their colors is a group of small pictures from Herculaneum. Related to still life and genre painting of humble subjects is the work of the mosaicist Sosos, who did the pavement of a room in Pergamon, called the "Unswept Room" (ἀσάρωτος οἶκος, asarotum), that is, a floor strewn with the refuse of a banquet. Part of this mosaic (probably it was the emblema) was the basin with doves perched on the rim (Pliny, *op. cit.*, XXXVI, 184). There are other mosaics which are certainly copies or imitations of that of Sosos: of the emblema with doves in a well-known mosaic from Hadrian's Villa near Tivoli (Rome, Cap. Mus.) and in a mediocre and unfaithful variation from Pompeii (Naples, Mus. Naz.); of the asarotum in a Roman mosaic signed by Herakleitos (Lat. Mus.), in a better mosaic from Aquileia, and in others. In the asarotum various objects are depicted as though thrown on the pavement: fishbones, bones of birds, mollusk and snail shells, and a mouse nibbling a nut (reminiscent of the motif seen in Campanian still lifes of a rabbit nibbling a fig). If the preserved copies are accurate, it would appear that Sosos was a naturalist, interested in the effects of shadows but nonetheless careful to use well-defined forms. His date is uncertain, but he perhaps lived in the period between the late 3d and early 2d centuries.

Some fragments of mosaics that have been found at Pergamon

drobably belong to the first half of the 2d century: one of them bears one of the oldest signatures of a mosaicist, Hephaistion, placed in a corner on a still-life representation of a piece of curled and folded paper. Others include a very fine emblema with an elegant parrot, in various tones of green with touches of yellow and red, and some beautiful fragments of masks and garlands. From the House of the Faun in Pompeii (PL. 179) come some of the finest examples of mosaic work: garlands, animals, fish, and a Nile landscape. A garland border with fruits, flowers, and tragic masks, which decorated the fauces of the house, is a work of the highest mastery in the keen observation of nature, the vivid and rich polychromy, and the opulent, grandiose conception. The painting from which it derives is thought to date from the 3d century B.C. The Nile landscape mosaic decorated the entrance to the exedra, which was paved with the Alexander mosaic; another mosaic had the completely Alexandrian motif of a winged Dionysian genius riding a tiger (a similar subject has been found in a Hellenistic mosaic from Delos; X, PL. 175); lastly, in the waters of the marine mosaic numerous fish swim around a beautiful central group of an octopus fighting a lobster (PL. 179). This mosaic, too, is certainly derived from a lost original of which there are other replicas; it is, along with the other mosaics, an example of the maintenance of classical traditions during the Hellenistic period, rather than of the newer impressionistic style. This is seen in the loving study of nature, in the firmness of the forms, in the rich and varied chromatic scale concentrating on quiet tones, and in the use of gentle harmonies rather than violent contrasts.

Whereas the Pompeian fish mosaics are apparently replicas of an older mosaic emblema, the fragments of the fish mosaic at Praeneste (mod. Palestrina; PL. 198), dated in the Sullan period, derive from a large original painting representing a large body of water surrounded by its shores, with an open-air sanctuary dedicated to Poseidon placed on one of the points of land. Certain other fish mosaics probably derive from the same original: for example, the fine mosaic of the republican era from S. Lorenzo in Panisperna in Rome (Conserv.). The Praeneste mosaic differs from the Pompeian examples in its livelier color; highlights are not greatly emphasized. The original was probably Alexandrian and of the first half of the 2d century B.C. Other fragments of Hellenistic fish mosaics have been found in Pergamon, Solunto, Syracuse, and Cyrenaica. The subject probably originated in Hellenistic Alexandria and was a favored one even in the latest period of Roman mosaics.

The art of caricature is frequently found in Pompeian paintings and mosaics of the late Hellenistic and later periods and certainly derives from earlier originals. The figures are sometimes human with animal heads (caricature of Aeneas who carries Anchises and Ascanius to safety), often Pygmies in parodies of myths and legends — the Judgment of Solomon (PL. 191), Theseus and the Minotaur, the Rage of Aphrodite, and other scenes in the House of Menander are among the most pleasing and oldest examples of the genre — but more frequently the Pygmies are pictured in Egyptian landscapes. There is no doubt that these are copies or reflections of Alexandrian paintings. (See also COMIC ART AND CARICATURE; GENRE AND SECULAR SUBJECTS; STILL LIFE.)

*Landscape.* Even more than genre and still life, landscape painting was a characteristic Hellenistic invention. There is still a widely held misconception that Greek art could not create landscape, and that it is rather an expression of Italic and Roman taste. In truth, both the literary sources and the date of the earliest preserved examples indicate that landscape painting belongs to the Greek cultural tradition. Likewise, the motifs in the repertory of Romano-Campanian landscape painting demonstrate that this art must be considered within the stream of Hellenistic painting. The feeling for nature and space is already present in Greek art: the first existed in the poetic imagination of the classical period and increased in the Hellenistic; the representation of space was a conquest of Greek art and one of its contributions to modern developments in painting. The introduction of foreshortening in relief, the idea of a figure immersed in the surrounding space, the representation of interiors, and the introduction of perspective and the effects of light are Greek innovations which prepared for the rise of landscape painting. Further, sure testimony of the Greek interest in landscape is offered by reliefs of the early Hellenistic period, the subjects of which are very close to Roman painted landscapes.

The first artists who can be considered landscape painters, Demetrios and Serapion, were Greeks, and probably Alexandrians. The former was probably an artist of considerable fame in his own period, as he appears to have been a friend of Ptolemy VI. Serapion was active in Rome during the same period (the 2d century, or earlier), as Varro says that a painting of his, of architectural perspectives or landscapes without figures, covered the front of the galleries over the Old Shops in the Forum. The decorators whom Vitruvius already considered as the "ancient" painters had introduced into their repertory "seaports, promontories, shores, rivers, springs, straits, sanctuaries, thickets, mountains, flocks, and shepherds"; these probably were represented in large paintings which covered entire walls. The "ancients" referred to by Vitruvius must have belonged to at least the 2d or the beginning of the 1st century B.C. and must be understood as Greeks. The mosaic with the Nile landscape from the House of the Faun in Pompeii belongs to the 2d century and to the Alexandrian milieu; it is the oldest preserved example of the genre, but it certainly goes back to older prototypes. Of the same period and provenance are the originals from which the two large Praeneste mosaics derive: the above-mentioned fish mosaic and the famous Nile mosaic (PL. 197). The most important landscape paintings known, the Odyssey landscapes from the Esquiline (PL. 180), were executed about 50 B.C. and represent a mature stage in the development of landscape painting, of which nothing is otherwise known. There is nothing more Hellenistic than the idyllic and romantic tone, the taste for the episodic, and the acute realism which characterize Romano-Campanian landscape painting. It is arbitrary to consider the beautiful landscape backgrounds of many Pompeian paintings (which are copies of even very early Hellenistic originals) additions by the Roman decorators.

Elements from which a history of landscape painting can be developed are few and uncertain; both the information from the literary sources (Demetrios, Serapion) and the date of the oldest preserved examples lead one to believe that a true art of landscape painting already existed in the 2d century — an art in which the human figure either occupied a secondary place or was actually absent. But certainly before this phase of development was reached there must have been a rather long period of progressive introduction of naturalistic elements, such as the landscape background, into figure compositions. The Pompeian painting of Achilles and Briseis, with ships on the sea represented in the background (this has been proved a part of the original composition), and the reference to the ships painted by Protogenes as accessory elements in his picture of Paralos can be considered examples of the classical period which show an incipient interest in setting a scene with landscape elements. Nor is it difficult to imagine that in the painting by Nealkes of the battle on the Nile between Persians and Egyptians (already mentioned) the landscape element played an important role. From the available information it would seem that Hellenistic landscape is inspired with a delicate taste for the idyllic and bucolic, even when a sacred landscape is intended (the altars, chapels, and open-air sanctuaries are the most frequent motifs); a frank realism is at times introduced, especially in the Nile landscapes, where it almost always tends toward caricature and the grotesque. Hellenistic landscape painting can be said to lack the elevated lyricism and the sense of cosmic drama which nature in its most solemn and impressive aspects has so often inspired in landscape painters of the modern age. Landscape painting could have developed contemporaneously in various centers of the Hellenistic world, but it is quite untrue that there is no basis for considering Alexandria one of the most active and fruitful centers. There are numerous indications of Alexandria's importance: first, the previously mentioned tradition of Demetrios and Serapion as Alexandrian landscape painters; further, the fact that the taste for bucolic and idyllic

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

landscape is seen specifically in Alexandrian reliefs; and finally, the fact that Roman landscapes contain so many reminiscences of Alexandrian Egypt in the Nile mosaics, the marine mosaics, and the stuccos and paintings of a character at once sacred, idyllic, and bucolic.

The broad mosaic band with representation of the Nile landscape, from the House of the Faun, is not only the oldest preserved example of the Nile genre; it is in a certain sense one of the oldest preserved Hellenistic landscapes. If the mosaic is an original work, this landscape belongs to the period of the house itself, that is, about the second half of the 2d century B.C.; it belongs to an even earlier period if, like others in the house, it is a copy of an older painting or mosaic. In style it has characteristics very close to the emblema of the fish and to the broad border with garlands and masks which were mentioned earlier: a firmness of modeling, clarity of the contours, a rich polychromy (based, however, on a quiet scale of colors), and a discreet use of the effects of light (especially present in the reflection of the duck on the smooth surface of the water).

The Praeneste mosaic in the "Cave of Destiny" is later in execution by several decades and goes back to an original of the second half of the 2d century. This mosaic is more vivid in color and shows a greater interest in lighting. The fresh style of the figure of the bather on the seashore, executed as a rapid sketch, anticipates the technique of the large Nile mosaic, which was previously uncertainly dated between the 1st century B.C. and the late 2d or early 3d century, and has now been fixed with sufficient certainty in the Sullan period. It is a revealing document of late Hellenistic, and certainly Alexandrian, painting and is one of the oldest Roman examples of a Nile landscape. Recent studies have proved that, although the mosaic has been greatly restored in modern times, the original passages are of fine execution and similar to the other mosaic, that of the fish, in the "Cave of Destiny" (PL. 198). The painter conceived of a vast composition presenting in one picture an image of the whole of Egypt, from the distant and fabled sources of the sacred river to the lands of the north, perhaps of the Delta. The proportionately large part occupied by the region of the sources (which is the least successful part of the composition) suggests that the mosaicist did not copy the whole of the painted original. The picture consists of isolated vignettes and episodes, united in a bird's-eye view; the apparently free composition reveals a scheme of broad parallel bands, reminiscent perhaps of devices of ancient Egyptian art, which is also revived in the inspiration of the work and in many of the motifs of the figural repertory. The narration is fresh and betrays an acute sense of observation of the realities of life in Hellenistic Egypt — the architecture, the costumes, and the nature of the landscape. The scene is dominated by a rustic note and a realism often tending toward caricature, in spite of the presence of large sanctuaries, sacred aediculae, and solemn priests. But the particular value and interest of the mosaic lie in its pictorial technique; form is dissolved into color, and the artist's predominant interest is in the effects of light: strong contrasts between the areas bathed in sunlight and the shaded parts, the effect of cast shadows, extensive use of white highlights, figures with broken contours, and over all a free, rapid, and sure execution. Perhaps this is one of the methods of that bold *compendiaria* painting of the Alexandrians which lasted until the time of Petronius or a little before. And it is in this Hellenistic painting that is found the precedent for the strongly luminous painting which flourished again and gained its greatest maturity in the Flavian period.

Dated about 30 years later (50 B.C.) are the paintings in the cubiculum of the Villa at Boscoreale and the above-mentioned Odyssey landscapes from the Esquiline (seven panels and some fragments are preserved). These represent the highest level achieved in this kind of painting; here the landscape itself is the protagonist of the picture, and the human figure, although of great importance in the conception of the subject, occupies an altogether insignificant position: it could be eliminated without altering the quality of the picture. For this reason, these landscapes are among the most lyrical of all known ancient painting (compare the completely different inspiration of the landscape in the Praeneste mosaic), even though the lyricism is of the Hellenistic type, which is delicate and loves to create an atmosphere of fable, rather than of horror and drama, for the narration of the old and beloved Homeric legends. The excellence of these paintings, however, rests not so much on their content as on their pictorial quality; here, too, the predominant interest is in effects of light. The picture of Odysseus in the underworld (PL. 180) may be cited as an example: the light enters from the left, clothing the sky, the mountains, and the surface of the water, and from behind illuminates the ship of Odysseus halted at the entrance to Hades; through a vast opening in the rocks the light penetrates the interior of the horrible realm, creating a broad, violently bright splash, and in this the artist has placed the little group of figures (Odysseus and his companions, Teiresias, and the other shades of the dead). From this scene the light casts more delicate reflections on the waters of Acheron, which is seen at the right in the foreground. In the zone of thickening shadow in front of the rock one sees three other small figures: the personifications of Acheron and Cocytus and, at a higher level, the soul of Elpenor, who sadly awaits his entry into Hades. Here the light is used not to create violent and sudden contrasts between light and dark, but to embrace the entire scene in a suffused halo; in this atmosphere the modeling of the rocks, in gradual and continually changing tones, becomes vaporous. The view extends to the horizon, where the blue of sea and sky meet. The Odyssey landscapes show an advanced skill, in the middle of the 1st century B.C., in the use of linear and aerial perspective to represent open space — that is, within the limits of ancient painting's accomplishments in this technique. These pictures, painted as views into the open air beyond the series of pilasters in the upper section of a wall decorated in the oldest phase of Style II wall decoration, cannot help but bring to mind the "Ulixis erationes per topia," which Vitruvius mentions as being among those subjects dear to the decorations of the "ancients." The subject, the Greek inscriptions giving the names of the figures, and the high artistic level have suggested the highly probable hypothesis that the Esquiline paintings derive from Greek originals of a considerably earlier date. But from the point of view of the history of Hellenistic landscape painting, the problem of whether these are copies or originals is secondary. Of much greater importance is the fact that the pictorial quality of the Odyssey landscapes presupposes an evolution of landscape painting which must have taken place during the 2d century B.C. and the first half of the 1st and which is completely unknown. The sketchy execution of the human figures has suggested parallels with the similar technique used on the Alexandrian vases from Hadra and thus the attribution of the possible prototypes of these paintings to the Alexandrian school. The hypothesis seems confirmed by certain details of iconography and by the probable Alexandrian origin of landscape painting in general. Of different character are the landscape paintings which decorated three walls of the cubiculum and its alcove in the Villa at Boscoreale (VIII, PL. 424; Met. Mus.); aside from the landscape, they are of greatest interest for the study of ancient theaters and of the earliest period of Style II. The walls are divided into 11 views into the open air beyond the architectural framework of columns and pilasters. Each of the lateral walls of the cubiculum has an identical triptych consisting of a central panel representing a gated precinct wall, with symmetrical side panels representing a closed door and a view of a city. The short walls of the alcove have two other views through an architectural framework to a tholos and surrounding portico. Another triptych (largely destroyed in antiquity by the insertion of a window) occupies the rear wall of the alcove; its central panel has a monochrome landscape at the base and, above, a portico of columns carrying arches. The symmetrical lateral panels contain rocky gardens enlivened by playing fountains, swaying branches, and birds; above each rock garden arches a magnificent vine-covered pergola. A comparison with two complementary passages in Vitruvius (vii, 5, 2, p. 172.12; v, 8, 1, p. 119.19), as well as some epigraphic evidence, have suggested that these paintings

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

are copies of those movable decorations painted on wooden panels (*thyromata*) which were at one time used to ornament Hellenistic stage sets. According to the distinction made by Vitruvius, the city views were sets for comedies, the columns and porticoes were for tragedies, and the views of houses with windows and balconies were for satyric plays. Since the use of painted *thyromata* must be placed approximately between the 2d and the first decades of the 1st century B.C., the originals copied by the Campanian decorator must have belonged to the same period. This interpretation is largely accepted; it adheres so closely to the Vitruvian passages, and the paintings so spontaneously suggest the idea of theater sets, that the recent contrary opinion (that they are not theatrical, but simply true Roman landscapes with villas and their grain storage buildings, porticoes, grottoes, and other details) is not convincing. As must have been the case in Serapion's large painting, the landscape is here the sole subject of the picture. Space is represented mainly by linear perspective with several vanishing points, but the artist also makes extensive use of aerial perspective, by which the objects gradually disappear in the distance. Architecture plays a dominant role in most of the views; the fantastic castle-like pile of houses, towers, porticoes, and hanging balconies pictured on the panels in the *comico more* strangely recall the architectural backgrounds of some of Giotto's paintings. The panel with the rocky garden (*satyrico more*) displays a sensitivity in the details of rich foliage, whose greens fade into the background, and in the treatment of the running water, the hopping birds, and the elegant pergola; the naturalistic tone created is thus different from the more grandiose beauty of the rock formation which occupies a large part of the composition and which indeed has the feeling of a rocky stage wing. The monochrome landscape of the central panel of the rear wall is of particular interest as one of the oldest known examples of the type which occurs with similar technique and repertory of motifs in later decorations (House of Livia, House of Obellius Firmo; fragments of other monochrome friezes from the Villa at Boscoreale, now in Musée de Mariemont, Morlanwelz, Belgium, and in Br. Mus.). Using only various tones of yellow and rapid, direct brushwork, the painter has represented a lakeside landscape with lacy buildings, bridges crossing the water, a boat gliding on the lake's surface, and slender figures of fishermen and wayfarers.

With good reason the most famous example of this genre of painting is the long monochrome yellow frieze in the House of Livia on the Palatine (later by several decades; of about 30 B.C.). The monochrome technique is more fully developed here than in the older example in the Campanian villa; together with the yellow, brown touches are used for the shadows, and white for the highlights. As in the Praeneste Nile mosaic, the subtle lines of the architectural and human forms stand out under strong contrasts of light and shadow. This rapid pictorial technique, in which the solidity of the forms seems to be consumed in the play of light, is combined with a broad and airy composition and a fluid narration with a hundred episodes and vignettes scattered in the landscape. The monochrome painting was executed by a decorator, but a highly skilled one with exquisite taste and facility of invention. His style has often suggested a parallel to the *compendiaria* painting particularly popular among (though not limited to) Alexandrian artists. Many elements in the frieze, especially the camel and the statue of Isis, belong to the Egyptian-Alexandrian world; the assumption that this frieze is an expression of Alexandrian taste and tradition, if not actually by an Alexandrian artist, is apparently well founded (though there are contrary opinions on the subject). In any case, this work of the Augustan period is a mature fruit of Hellenistic art and civilization, which received some of its most felicitous expressions in Rome and Italy.

*Portraiture.* Only a general idea of Hellenistic portraiture may be formed. In the period between the end of the 4th century B.C. and the beginning of the 3d — the only period which Pliny, with his classicistic taste, discusses in detail — the major artists also practiced portraiture. From Apelles to Ktesilochos and Protogenes, from Aëtion to Antiphilos and Leontiskos, there are many portraits of Alexander, of members of his entourage, of women he loved (Pankaspe by Apelles, Roxana by Aëtion in the painting of the marriage of Alexander), and of Hellenistic kings. There must have been portraits in the many battle paintings mentioned in the literary sources, although it is not possible to say to what degree they were idealized. The names of three portraitists of the period of Varro are known: Iaia of Kyzikos, Sopolis, and Dionysios; the last was nicknamed, it seems, the "Anthropographos," precisely because of his practice of this genre (Pliny, *Naturalis historia*, xxxv, 147). Iaia painted in Rome during the time of Varro's youth and used tempera and encaustic. She painted women's portraits in particular, including a self-portrait, using a mirror, and a large portrait of an old woman (formerly in Naples). She painted rapidly and attained such great fame that her pictures sold for higher prices than those of the two other famous contemporary portraitists whose works also filled the painting galleries at the time of Pliny. Perhaps the artist Koinos, who made stemmas (Pliny, *loc. cit.*, 139) and was active in Rome in the late Hellenistic period, was actually a portraitist, the stemmas being family trees with portrait busts. These bits of information suggest that the artists who were doing portraiture in Rome at the end of the republican period were largely Greek painters, the last heirs of a tradition about which almost nothing is known. The art of portraiture had also invaded illustrated books — if one can trust the testimony that the *Imagines* by Varro was illustrated with 700 portraits of famous Greeks and Romans, arranged in groups of seven. Information from actually preserved painted portraits is slight but often very significant. Darius and Alexander in the mosaic of the battle (PL. 154) are represented as transfigured in the bloody fight. The figure of Alexander, in its boldly expressive manner, shows most clearly the taste of the new epoch, now far removed from classical ideals. Some of the figures in the *megalographia* from Boscoreale (PL. 192) are true portraits, in the grandiose, dynamic style of the period. There are not many Hellenistic portraits in sculpture which equal the so-called "Menedemos." The portrait of Menander seated, in the House of Menander in Pompeii (ca. A.D. 50), is thought to derive from his picture in the series of portraits of comic authors (some interpret them as actors) painted by Kratinos in the Pompeion in Athens (Pliny, *loc. cit.*, 141). The Campanian painting is of careful execution but is stylistically rather insipid. If it does derive from Kratinos' work, it reveals only that it was a work in the simple style with self-contained rhythms such as are familiar in sculpture of the early Hellenistic period. There are two mosaics of the Seven Sages (Torre Annunziata, Sarsina) which probably derive from a painted Hellenistic original; but the mediocrity of the execution, and the fact that the Sages could only be represented as imaginary portraits, remove these mosaics from a discussion of true portraiture. The many, and frequently excellent, portraits preserved from the Roman period (few but significant examples from Pompeii, and a rich and generally good series of portraits on wood or linen from Egyptian mummy covers of the 1st–4th cent.) reflect the tradition of Hellenistic painted portraits. At one point it was believed that the painted ceramic tondi from Centuripe (anc. Kentoripa; attributed to the 3d–2d cent. B.C.) were examples of this tradition, but their authenticity has been shown to be doubtful.

*Systems of wall decoration.* An important role in the history of Hellenistic painting is played by the study of the painted decorations used by the Hellenistic Greeks, and subsequently the Romans, to cover the walls of their public buildings and houses. Here, too, the main and almost exclusive sources of information are the cities buried by the eruption of Vesuvius in A.D. 79, along with a few important decorated rooms found in Rome. The more important for their rarity are the fragments found in other parts of the Hellenistic world (Priene, Athens, Delos, Alexandria, Pergamon, Magnesia ad Maeandrum, Russia, and southern Italy). Valuable evidence is found in Vitruvius, who in a long passage in his book *De architectura* (vii, 5) traces the development up to his time,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

almost in outline form. The monumental evidence substantially corroborates the exactitude of Vitruvius' information. Hellenistic-Roman decorative painting developed in the period between the 3d century B.C. and the end of the 1st century of our era; it subsequently fell into the trap of overworked schematic patterns and finally died. The decoration passed through stages of imitation of structural and architectural forms, becoming increasingly fantastic. In the first stage the stuccoed surface of the wall itself is simply painted with imitations of precious materials (marble, for the most part polychrome); in the later development a rich and fantastic architecture is imagined to project from the actual wall, or is as though seen beyond it.

This basic line of evolution contained variations at different times (in the kind of architectural elements represented, in their arrangement, in the adherence to reality, and in the coloring) which scholars have sought to define as successive "Pompeian" styles, so called because they were first defined on the basis of painting in Pompeii. The four styles first established by August Mau have been increasingly differentiated and given a precise chronology. Currently, the development is seen as follows: imitation of the different structural parts of the wall (socle, orthostate, intermediary cornice, and frieze zone) by means of color seems to have been done first with a series of parallel bands of flat color corresponding to the individual zones of the wall itself ("zone style"). In this phase, imitation of polychrome precious materials is limited to the base of the wall; above the intermediary cornice the wall is plain. This primitive phase of Style I, which is known especially from examples in Alexandria, Thrace, and southern Russia, is followed by another which introduces the imitation of rows of blocks in the upper wall as well, and later adds more complex elements: little galleries and pilasters at the top of the wall (Delos), or rows of pilasters running the entire height of the wall. The principle of illusionism, in which the wall is opened and pushed back, is introduced here and begins its long development.

The oldest known example of Style II (the House of the Griffins on the Palatine, end of 2d cent. B.C.) has a widely spaced row of Corinthian columns on a base, represented in front of a wall painted in imitation of sumptuous polychrome marble. This first phase of Style II (A) is followed by three others (B, C, D) in which the principle of the illusionistically opened wall is accentuated with increasing fantasy. On the other side of the painted projecting members (socle, pilasters, and columns), the eye no longer meets a representation of a real wall but wanders freely over distant views of cities, gardens, and porticoes (Villa at Boscoreale). In the last phase of Style II (in the late Augustan period) the painted architecture becomes more thin and unreal, with increasingly rich decoration. These characteristics are strongly emphasized in Style IV (PL. 214; VIII, PL. 93), which in Pompeii is found particularly in those houses reconstructed after the earthquake of A.D. 63. Style III is today considered to have been parallel, at least in part, to the last phase of Style II. It was an attempted reaction against the excessive illusionism of Style II: the decoration flattens out and becomes linear; large panels are preserved plain, almost in imitation of large cloth hangings stretched from point to point. In the development from Style I to Style II, to the horizontal division of the wall is added (or even substituted) a vertical foreground system of simulated architecture (pilasters and columns). In the most advanced phase of Style II begins a standard tripartite division of the wall by vertical units: a central aedicula with lateral views. Within these systems of wall decoration, figure and landscape paintings are inserted in various ways; they play no role in Style I decorations, with a few exceptions such as the frieze of Erotes in the house on Delos (mentioned above). In the later styles paintings are sometimes introduced as shuttered panels placed on the fictitious cornice or hung on the wall and columns; at times the figure paintings take the form of broad friezes covering the entire wall above the painted socle, as in the Villa of the Mysteries and the Villa at Boscoreale; or the figure compositions are seen within an aedicula, or as actual paintings inserted in the walls; at times isolated figures are placed in the center of the broad panels of the wall decoration or are distributed in the architectural system; and finally, at times they are inserted as small friezes. For this part of the decoration — the figured compositions — the Romano-Campanian painters quite frequently copied and varied Greek paintings, deriving entire paintings and figure motifs from pattern books. It is wrong to undervalue the art of these decorators; they were often very capable masters gifted with refined taste. One should not forget that these Romano-Campanian decorations often have been a source of inspiration for artists of the modern period, even great ones. The grotesques of the Italian Renaissance derive from the decorations of the Golden House (Domus Aurea) of Nero (PL. 215; the buried rooms were known in the Renaissance as grottoes), and the Empire style of decoration, popularized especially by Percier and Fontaine, derives from the decorations of the then newly discovered houses of Pompeii and Herculaneum.

There can be no doubt that the system of decoration in the Italy of the republican period was an imported one. The Pompeian examples of Style I decoration date as early as the 3d century B.C., but earlier examples are known in Alexandria, Priene, Delos, Athens, Pergamon, and southern Russia. There are several indications that Style II (which some consider to be typically Italian) is also of Greco-Oriental origin — perhaps from Syria, and especially Alexandria in Egypt — in addition to Vitruvius' testimony concerning the decoration of the Ekklesiasterion at Tralles by Apatourios of Alabanda, which has all the characteristics of the last phase of Pompeian Style II. The origin of Style III is more uncertain; perhaps the theory that it resulted from a new eclectic taste for the exotic in the Augustan period is preferable to the theory that the abundance of Egyptianizing motifs (V, PL. 195) prove it to be of Alexandrian origin. The next development, Style IV, seems also to have originated in Italy. It is an accentuation of Style II in its imitation of architectural elements and its sense of color. Many scholars agree that Hellenistic and Roman theater decoration influenced the later phases of Style II and, later still, Style IV (see above concerning the Villa at Boscoreale).

CERAMICS. The features which characterize the history of Hellenistic ceramics can be summarized as follows: (1) survival and decay of traditional 4th-century ceramic types in the late 4th and early 3d centuries; (2) the popularization of new shapes with decoration painted on a monochrome ground, generally black; (3) the spread of various types with monochrome decoration, generally black, on the natural clay ground; (4) the frequent appearance of pieces with lively polychrome decoration on a uniform light ground, usually white; (5) broad diffusion of relief ceramics of various types; (6) production of enameled ceramics. For the most part, Hellenistic ceramics abandoned the figured scenes of Attic and Atticizing ceramics. These were replaced by minute decorations with human figures in reduced scale or very often with purely ornamental motifs — geometric, plant, or animal — which were sometimes combined in the manner of still-life compositions. The mark of the new times is found in the naturalistic repertory, the refined elegance, the grace, the decorative detail, the touch of grotesquerie and caricature, and in the often sketchy rendering of the subject.

The prolongation of traditional ceramics, a secondary phenomenon, represented a deterioration of all the types that had been popular in the various centers of production (Attica and especially southern Italy and Etruria) in the 4th century. These types include vases with red figures on reserved ground, with the addition of rich polychromy and gilding; black-ground wares with figures superimposed in white; monochrome ceramics with black glaze and often with relief decoration, with smooth surfaces or ribbing, frequently with restrained decorative motifs in white or gilded yellow (small bands, branches, or garlands); and late Panathenaic amphoras. The production of Panathenaic amphoras — those in the traditional black-figured technique as well as those with white ground — continued throughout the Hellenistic age and even beyond. Not a few of the established groups and recognized masters discussed in the most recent criticism of late red-figured production seem to date to the end of the 4th century or to the beginning of the 3d. Mention

should be made of the very last production of the Kerch vases; of the richly polychromed and gilded hydria from Alexandria (found in the Hadra cemetery), depicting the Judgment of Paris, the work of an Attic workshop of some quality (ca. 330–320); of Apulian wares, the Sarpedon Painter, and the vases of Lykourgos and of the Ilioupersis; of the works of the Red Swan group and the Xenon group, related to Gnathia products; of Lucanian production, with the Painter of Naples 1778 and the Painter of Naples 2585, and the contemporary Jason crater (Naples, Mus. Naz.); of the Braniki Painter, the Painter of London F. 229, the Siamese Painter, and the Vitulazio Painter, all Campanian; and of the Lentini group, perhaps Siculan. Etruria is one of the areas in which the production of red-figured ceramics continued longest and the one in which the quality most deteriorated. The so-called "Volterran" craters (dating from between 330 and 275) are of particular interest for the Italic portrait profiles that decorate them. The "Hesse group" products do not have a provincial character. These products, found in southern Etruria, are decorated with putti and Erotes painted in a uniform white on a black ground (first half of 3d cent. B.C.). Another type of Italiote ceramics (Campanian or Apulian) continued to be reproduced well into the 3d century B.C. This was the plate whose interior was richly decorated (in the usual red-figured technique) with multiple fish, often rendered with considerable vivacity and compositional skill.

The monochrome ceramics with black glaze (mentioned above) enjoyed widespread use in the Hellenistic age. Noted for its fine technique and beauty of form, the type originated in Attica and was imitated in many centers. From this ware is descended the popular and economical so-called "Etrusco-Campanian" ceramics, which are black and lack painted decoration. Crowns of palmettes and short lines were often impressed on the bottoms of "Etrusco-Campanian" plates and cups. A particular type of ceramics marks a genuine transition from the 4th century to the Hellenistic period. This is a black monochrome ware, usually ribbed, with relief decoration limited to certain areas of the vase and generally consisting of small figures or groups made from a mold and applied before glazing (*Plakettenvasen*). This category of ceramics (which can roughly be dated to the 3d cent.) had a precedent in the famous Cumae hydria (Leningrad, The Hermitage) with Eleusinian scenes depicted in relief on the shoulder. This work dates from the late classical period, or it is an exceptional piece from the late 4th century. The most recent criticism has attributed the hydria to a Tarentine workshop and dated it between 310 and 300.

Many of the types mentioned have white decoration superimposed on the glazed black ground (the Hesse group and the last-mentioned category of vases, in which painted decoration often accompanies the relief). This technique was used widely by numerous Hellenistic workshops between the end of the 4th century and the first half of the 3d. The principal types so far distinguished, more or less approximately, are the so-called "West Slope" ware (perhaps of Attic origin), the kind called "Gnathia," and a Campanian-Latian type, of which there are few examples. Studies of the first were begun after some chance discoveries on the west slope of the Acropolis in Athens, but products of this type have come to light in many localities of the ancient world (e.g., the Greek mainland and islands, Asia Minor, and Thracian Chersonesos). The decoration (plant, geometric, thyrsos, bucranium, dove, and dolphin motifs; occasionally human figures) is painted for the most part in yellow-orange with touches and details painted in white or incised. The pieces are rather small and include oinochoai, skyphoi, kantharoi, and plates. Gnathia ware is of Apulian or Tarentine origin but probably was imitated elsewhere. It differs from the preceding Attic type in various details, though the styles are closely related. Besides small vases, the repertory of Gnathia ware includes the hydria, the crater with knotted handles (PL. 194), the volute amphora, and such typically Apulian forms as the epichysis and some variants of the askos. A fairly extensive use of bead designs on certain parts of the vase is common. The painted decoration in white, yellow, and red (mostly in white) consists of plant motifs, bands, clusters, and trellises of grapes, masks, musical instruments, and figures of animals. The human element occurs rather frequently, either in the form of single heads (generally female, occupying the shoulder of the vase or the bottom of the kylix), whole figures, or fairly complex scenes (e.g., cupids racing in chariots, women playing at games). Besides at Gnathia, vases of this type often are found in other parts of Apulia and Italy in general, as well as in Greece, Cyprus, Egypt, and elsewhere. Their production began toward the mid-4th century and continued in the 3d.

The Campanian-Latian group of ceramics with overpainted decoration is represented by very few pieces (ten vases and five small pitchers). They are distinguished by a Latin inscription of the name of the god to whom each vase was dedicated followed by the word "pocolom" (poculum). The color used for the decoration was yellow, orange, or white; plant forms (leaves and twigs) accompany, and often surround, human motifs (female heads, small figures of Eros). These pocula, dated to the first half of the 3d century, appear to be from a Latian or Campanian workshop. Some examples of uninscribed plates very similar to those with inscriptions can also be considered part of the group. A famous example (Rome, Villa Giulia) is from Capena and bears a representation of a war elephant with a tower and soldiers on his back followed by a smaller elephant. Another example is in Tarquinia (Mus. Naz.) and shows a vivacious little Eros holding a tray with offerings and a small pitcher; it is rendered in a lively and sure style.

Three exceptional, large ceramic pieces (two of which are certainly of Alexandrian provenance and the third, in Munich, Antikensamml., probably of that origin) have overpainted decoration (white, orange, pink) on a dark ground and probably date from very early in the period. The Alexandrian workshop that produced them was probably subject to some Apulian influence. One of the pieces is an amphora from the necropolis of Shatby (Alexandria, Greco-Roman Mus.) with two parallel bands of varied motifs; the principal band has a rich plant motif in spiral design of Apulian taste. The second piece is an elegant hydria formerly in the Von Bissing Collection (Munich, Antikensamml.), with sprigs of leaves in relief on the lower part, beading above, and, in the middle, a band of figures (Herakles and Geryon; a griffin and a bull). The third piece is a very rare kalpis (from Hadra; Alexandria, Greco-Roman Mus.) with the form and decorative idiom of Hadra vases but exceptionally painted in the previously mentioned technique; on the front between the handles is a panel with two fighting centaurs. This centaur vase marks the point of transition between the early Hellenistic ceramics, which are more faithful to the technical traditions of the 4th century (a dark ground with superimposed decoration in color), and one of the two categories of the so-called "Hadra" vases (PL. 194). This category is characterized by painted decoration of uniform color, black or brown (sometimes also reddish), traced before firing on the natural ground of the clay. (The other category has a white ground with polychrome decoration; see below.)

Vases of this type have been found in large quantities in Alexandrian necropolises of the early Hellenistic period, but occasionally specimens have been found in such localities as Cyprus, Crete, and southern Russia. In a certain sense the technique represents a return to that of black-figured vases, as did that of the vases from the sanctuary of the Kabeiroi near Thebes (before 335), and, beyond the prolongation of the black-figured Panathenaic amphora, that of the so-called "Cumaean" lekythoi and other secondary groups. It was precisely the kalpis (the so-called "hydria"), seen earlier in the centaur vase, that was the vase type used as a cinerary urn. The decoration is composed of horizontal bands and lines of uniform color, variously distributed around the foot, the body, and the neck of the vase; of palmettes of various types, spirals, olive branches, rosettes, bucrania with bands; of dots used as secondary motifs at the place where the handles are attached, around the neck, and on the shoulders; and of one or more bands containing motifs of branches, small festoons, rows of wreaths, dolphins, human or animal figures, and griffins. Sometimes the decoration forms an actual picture, such as the battle of centaurs on the polychrome Hadra vase. Other scenes include little

cupids hunting a stag, a small funeral monument flanked by two Harpies, athletes, and a cockfight (III, PL. 137). The principal bands are generally on the upper part of the vase between the two lateral handles, but they are sometimes found on the back of the vase below the vertical handle. Touches of white and incised drawing are often applied to the dark glaze.

The execution is usually of rather ordinary quality, but a number of examples are marked by skill and virtuosity in the rendering of the black silhouettes of the decoration. The manufacture of both classes of Hadra ceramics probably started in the last years of the 4th century, but its major flowering was in the 3d. A group of examples with inscriptions (New York, Cairo, Alexandria) appear to date from between 259 and 212. The other category of Hadra vases belongs to the class of Hellenistic ceramics with polychrome decoration on a white ground. In a certain sense it harks back to the white-ground Attic ceramics of the 5th century (though differing in technique and color sense), but it also continues the taste for lively polychromy, often brightened with gold, that had characterized the red-figured ceramics of the 4th century. All the vases of the second Hadra category are cinerary urns in the form of a kalpis, but they are more bulging and squat than the vases of the other category. The entire surface of the vase was covered with a thin white wash, on which simple polychrome motifs were executed. The garland, with or without taenia, was the most common motif and decorated the front of the vase between the lateral handles. Other motifs included swords, cuirasses, shields with Gorgon heads, vases, and, occasionally, human figures. The repertory of subjects may have been much richer than it appears today, for most of the examples recovered have lost their polychrome ornamentation, which was executed in a very delicate process similar to that of tempera. The colors most frequently used were pink, green, yellow, violet, and brown. In these vases, too, the decoration sometimes takes on the aspect of a still life. The standard of production must have been quite high. Among the well-known examples of vases of this category are one in New York with a beautiful Gorgon head in the center of a shield; one in Amsterdam (Allard Pierson Mus.; formerly Six Coll.) with the representation of a Panathenaic amphora, a palm branch, bands, and a torch (similar examples in Cairo, Eg. Mus.; Alexandria, Benaki Coll.); one in Cairo (Eg. Mus.), decorated with a pair of large shoes (a similar example in Leipzig, private coll.); and another (Leipzig, private coll.) with the representation of a covered pyxis, a fan, and a mirror. These vases, like those of Centuripe (discussed below), are those which most likely reflect something of the technique and style of contemporaneous painting.

Some examples of light-ground ware with superimposed polychrome decoration can perhaps be attributed to 3d-century workshops in Canosa, Apulia. Among others are a fine Canosan pitcher (Bari, Mus. Arch.) with a pink ground, restrained relief decoration on the neck and at the springing of the handles, and a broad row of figures painted in red, pink, yellow, blue, and brown (a woman on a quadriga preceded by Eros; hippocampus); and a kantharos with high handles, formerly in the Campana Collection (Louvre), with whitish ground and polychrome decoration in dark red, blue, and light brown (a nude ephebos with a torch and a tympanon, a woman with a pyxis and a mirror, and a luxuriant plant motif under the handles). Some oinochoai found in Tunisia (museums in Carthage and Tunis) have a smooth white ground decorated with plant motifs (sometimes in color) that envelop the body of the vase; secondary motifs (rays and waves) adorn the base, neck, and shoulders.

Lagynoi constitute another class of polychrome ceramics. These bottles, which have squat bodies and high necks with handles, were produced from the second half of the 3d century throughout the Hellenistic age. They have come to light in various places (Greece, Asia Minor, Cyprus, southern Russia, Egypt, and Cyrenaica) and probably were produced by several workshops. The polychrome decoration of these bottles is similar in the sureness of its technique to that of the Tunisian vases, though quite different from the tempera decoration of the Hadra vases (and perhaps from that of the Canosan vases). The colors, however, are less bright in the bottles than in the Tunisian vases. The decoration of the bottles is reddish-brown on a smooth off-white ground. The most important motifs appear on the shoulder of the vessel; the most frequent motifs are linear, plant, marine, and depictions of single objects such as amphoras, masks, lyres, and garlands. Many other Hellenistic vases, more modest and of the most various provenance, are decorated in a similar technique and polychrome style. These pieces include small pitchers of various shapes, pyxides, and incense burners. Decoration with bands and parallel lines is used frequently and generally enlivened with plant and other motifs. Consciously or not, this union of geometric and naturalistic elements revives a decorative concept close to that of Geometric vases, especially in some wares coming from Egypt and southern Italy. The entire surface of the vase is covered with a close network of geometric motifs (parallel lines and bands, checkerboard designs, serpentine lines, meanders, and rays); the colors used are subdued tints.

In the Hellenistic age, relief decoration assumed the most varied forms. It has already been noted in black-glaze vases with small figures, single or grouped, applied to the surface. Sometimes the decoration of polychrome ware becomes high relief or even a completely freestanding projection, as in the vases of Centuripe in Sicily, the so-called "Canosan" vases, and others (PL. 78; III, PL. 138). At times relief constitutes the principal or entire decoration, often depicting rather complex scenes, as in the "Megarian" cups (II, PL. 59) and Calene ware. In two tall, elegant, covered amphoras which may have come from a Tarentine factory of the 3d century B.C., the relief is still an accessory element (Baltimore, Walters Art Gall.). At the bottom of the gadrooned body is a clump of leaves, and at the top a frieze of little Dionysian putti or Erotes in low relief. A lively but restrained polychromy completes the decoration (a white ground with details in pink and gold). A considerable number of vases from Centuripe are extant (about 90, most of which are in Sicilian museums; others in Rome, Villa Giulia; Met. Mus.; Louvre). The most popular types are a kind of deep crater (bell- or chalice-shaped) and a kind of lekane or cup. These works are generally composed of separate pieces: a removable base or foot, a body, and a cover with a finial (III, PL. 138). Secondary or occasional types are the kotyle-crater and the lekythos. The relief elements (plant motifs, astragals, wave motifs, lion and Medusa heads, Erotes, animals, and hippocampi) were generally executed separately and variously applied on the foot, base, and cover of the vase.

Both relief and smooth surfaces were brightly painted, and gilding was often applied (especially to the relief portions). The principal decoration, painted in tempera, was figured and was almost always limited to the front of the vase. It generally comprised three figures (though there are also compositions with two, four, and even five) drawn on a solid ground and only rarely supplemented by some architectural element to set the scene. Often the scene has no specific reference, but sometimes it is related to the Eleusinian or Dionysian mysteries. (In spite of the scarcity of information about the nature of the sites in which they were found, these vases seem to have had a funerary purpose.) In general, the Centuripe ceramics show a decidedly provincial taste in their inelegant forms and heavy, cumbrous plastic decoration. Because of the fragility of the technique, only an evanescent shadow of the painted decoration has survived in many cases. In the best-preserved examples (Met. Mus.) the subject has a marked nobility and fineness of style which makes the delicate and graceful little female figures comparable to the finest examples of painted funerary steles and of Hellenistic Campanian painting. The Centuripe vases ought to be dated about the 3d century, although some authorities have proposed the 1st century for the entire class or part of it.

The further elaboration of plastic decoration gives a still more provincial character to another category of Hellenistic vases found in Italy — the so-called "Canosan" vases, largely discovered in the Canosa area of Apulia. For the most part, they are large heavy askoi, from the bodies of which reliefs and freestanding figures project: female figures, Nikai (Victories), Erotes, Amazons, Gorgon heads, and protomas of Triton (PL. 78).

On some better-preserved examples the painted decoration (e.g., palmettes, floral motifs, griffins) of the smooth areas has survived. Relief and painted decoration flash with violent contrasts of intense pink, red, blue, and white. These works, which seem to be contemporary with the fine Canosan vases with simple painted designs, are believed to date from between the end of the 4th century and the end of the 2d. A vase from Lampsakos (Istanbul, Arch. Mus.) with gilded ground, rich polychrome decoration, and very high relief is completely different in quality. It is a hydria very similar in form to the polychrome Hadra vases. Almost the entire front surface of the body and shoulders is covered with a depiction of the hunt of the Calydonian Boar. The vase probably dates from the last years of the 4th century and is one of the many products of Hellenistic ceramics which imitate contemporary metalwork. This is also true of many ceramic products decorated with silvered or gilded relief (the cycle of Herakles, a Nereid riding a pistrix, the Amazonomachy), most of which have been found in the region around Bolsena, Orvieto, and Orbetello. In spite of the Etruscan provenance, it is believed that they were produced in the factories of southern Italy (Apulia) that were active between the 3d (or 2d) and 1st centuries B.C.

The other type of relief ceramic, the one in which relief is the only decoration, was very widely distributed throughout the Hellenistic world. It is the prototype of the Arretine and terra sigillata types of ceramics. In the very wide production of this type two principal groups have been differentiated: the so-called "Megarian" vases (PL. 194) and the Calene ware. The Megarian vases are generally covered with a black or red glaze, more or less glossy and dilute. The basic form is that of a hemispherical cup without handles. It has relief decorations of various kinds, including a luxuriant calyx of leaves growing from the bottom and embracing the greater part of the surface (the motif most frequently used and richest in variety and refined expression). Other motifs include long, stylized rays, the tile motif, and bands and parallel lines between which figures are enclosed (isolated figures, hunting scenes, rows of Amazons, mythical scenes). The edge of the vase is decorated with meanders, circular forms, rosettes, spirals, and other motifs. The numerous Megarian factories were situated in Athens, Delos, Antioch, Pergamon, and Alexandria. Recent studies made after the stratigraphical excavation of the Agora and Kerameikos in Athens indicate that production began in the 3d century and extended almost throughout the 1st century B.C. It passed through a series of stylistic phases, with naturalistic accents and finer execution in the earlier periods, and a progressive stiffness and technical decline in the later ones. There is a great affinity of form and motif between the cups with leaf calyx decoration and silver vessels (from Egypt, Bulgaria, and Civita Castellana in Italy), gilded and polychrome glassware, and faïence (from Egypt). The often proposed hypothesis of an Egyptian origin of Megarian vases, through silver models and perhaps through earlier ceramics, is likely.

A special group of these cups comprises the so-called "Homeric" or "literary" skyphoi, decorated with subjects drawn from the cycles of epic and tragic poetry [e.g., Iphigeneia in Aulis (II, PL. 59), the birth of Oedipus, the slaying of the suitors of Penelope, the destruction of Troy, the murder of Polyxena, etc.]. These illustrations are generally accompanied by inscriptions with the names of the characters, the literary sources from which they originate, and even quoted passages of these texts. In several cases the names of the potters are also mentioned: Dionysios, Asklepiades, Ariston, Menemachos, Aphroditos, Herakleides. The elements of the relief decoration were either made from separate molds and put together later, or they were included in a mold for the whole vase. Almost forty types are known, in large part from Boeotia. The Homeric skyphoi were formerly attributed to the 3d century but now are more correctly assigned to the period from the middle of the 2d to the end of the 1st century B.C. Although of very poor artistic quality, they are interesting because of their relation to literature and possibly to illustrated books of the Hellenistic age; some of the compositions may have been derived from these books. A group of Megarian vases has been identified as coming from Italian factories, less because of where they were found than because of the signatures inscribed on them of C. Popilius, C. Lappius, L. Quintius, and L. Atinius. The works signed C. Popilius, who seems to have had two workshops, in Otricoli and in Mevania, are particularly interesting. In the form and in the subject and handling of the ornamentation, the vases are very similar to those of eastern factories. Of works with continuous friezes, a particularly noted one was produced in the workshop of Popilius. This vase represents a battle between Greeks and Persians with a composition deriving in part from the same pictorial source as the great Pompeian mosaic of the Battle of Alexander (PL. 154). The production of the ceramics is today attributed to the early 1st century B.C.

The figured relief decoration of the so-called "Calene" vases is of greater importance and stylistic value than that of the Megarian vases. The former are attributed to workshops in Cales, Campania, on the basis of the ethnic indication accompanying the signatures of some of the potters, that of L. Canoleius in particular. A recent disputable hypothesis, based principally on a vase inscription which reads "Caio[s] Serponio[s] Calebus fece[t] Vico Esquilino" (Caios Serponios from Cales made [it] in the Esquiline quarter), proposes that the potters were from Cales but that they worked in Rome. Other known artists are Titus Lucius Servius, Caius Gabinius, Caesus and Numerius Atrifius, L. Anicius, and Calonos, who adds to his signature the expression "Calibus" (from Cales). It seems certain that a good part of this ceramic production is to be attributed to Cales, even if one admits that there may have been other workshops on Italian soil. (Vases have been found, as well as in Cales, in Ruvo, Canosa, Etruria, and Teano.) The production is assigned to the period between the beginning or middle of the 3d century and the first decades of the 2d. The vases are covered with a dilute black glaze of a leaden color. The principal types are the guttus with decoration on the upper part, the patera with a central medallion, and the mesomphalos patera with decoration on the internal walls around the "navel." The decoration of the medallion patera generally consists of divinities or mythological personages in full figure or just heads, single or in groups. (These also appear on the gutti.) There often occurs the singular use of depictions that are derived from celebrated works of antiquity (e.g., the Athena Parthenos of Phidias, or the boys of Boethos); sometimes elements were even cast from Syracusan coins of the 5th century. The repertory of classical art was a source also for the decoration of mesomphalos paterae, which generally depict mythological scenes (the Rape of Persephone, Dionysian cortege, cortege of Nikai in quadrigae, little cupids hunting, wreath of flying cupids and Nikai); the scenes were sometimes copied from silver paterae of the 5th century (Br. Mus.; Met. Mus.). The decorative style of metal vessels occasionally was imitated in terra-cotta vases (examples in Alexandria). The procedure consisted in covering the surface of the vase with a thin film of stucco, which was gilded after being ornamented in low relief with motifs typical of metal vases (ribs, egg-shaped molding, astragals, bands, interwoven palmettes, and spirals). Among the many other relief ceramics, Egyptian products of the late Hellenistic or Roman age are notable. Most are of small proportions, and their relief decorations were generally inspired by the Greco-Egyptian repertory (Isis, motifs of the Nile and of local flora). The manufacture of these vases seems to have been in Memphis rather than in Alexandria.

Other classes of relief ceramics are the so-called "Pergamene" vases and the enameled vases. The former come from various places (Pergamon, Priene, Delos, Athens, Alexandria, southern Russia, and Antioch) and are characterized by the use of a very fine, purified clay whose polished surface is a beautiful coral red. The most popular forms are the skyphos, with or without handles, the lagynos, the lekythos, and the fairly deep plate. The decorative elements consist of geometric and plant motifs, griffins, masks, Erotes, maenads, satyrs or seilenoi, and small figures of divinities; these elements were made separately and applied to the surface of the vase, generally in a band around the body. In many cases the influence of metalwork is evident. The production does not seem to have begun before

the 2d century, but it continued in the Roman age. Enameled ceramics, mainly with relief decoration, are certainly the least known and studied of Hellenistic wares, in spite of their wide distribution and very interesting character. They come mostly from Egypt, various localities in Asia Minor, Greece, Syria, Mesopotamia, Russia, and southern Italy. In many cases the finds are certainly importations, hence it is not possible to establish with exactness the manufacturing centers, which must have been numerous. However, two large classes of these enameled ceramics can be recognized, the Egyptian and the Near Eastern, which differ in technique, in vase shapes, and in decorative repertory, even though points of contact naturally are not lacking between them. Egyptian enameled ceramics of the Hellenistic age (whose manufacture was to continue until the late Roman era) resume and continue the ancient tradition of the type. They unite vase forms and decorative motifs of purely Greek character with others of the old Egyptian repertory. In color they are of gradations from green to blue with the frequent use, especially for accessories, of reddish-brown, milk-white, and yellow. The most popular shapes are small globular vases with high flaring necks, small shallow plates decorated with tapering leaves, open cups with barely curved sides, and deep cups formed like the calyx of a lotus, all in Egyptian taste, and the skyphos, alabastron, oinochoe, kantharos, and askos, all Greek types. The decorative motifs are generally impressed or incised on the surface of the vase, and are often completed by details in low relief or by masks and little figures made separately and then applied. Their repertory ranges from linear geometric forms to plant and animal motifs; the composition is in parallel zones and in panels or, in a manner more appropriately Hellenistic, in no fixed scheme. In many cases the vases repeat the ornamentation of metalwork. The "Queens'" oinochoai are a separate class, on which generally appears the figure of a Ptolemaic queen (identified by an inscription of her name) in the act of pouring a libation near an altar and at the side of a baetylic (sacred stone) pillar. Examples are known with the names of Arsinoë II and Berenike II and even with the name of Ptolemy IV, all, therefore, of the 3d century B.C.

The Near Eastern enameled terra cottas have more brilliant and stronger enamels than the Egyptian ones (whose surfaces are extremely crumbly). The vases from Asia Minor are colored green, brown, or yellow, but the class is less varied than that of Egypt, and the imitation of metal vessels is even more common. The usual shapes are skyphoi with double handles, mugs, cups with feet, and small pitchers. The most frequent motifs are plant (branches, garlands, festoons of various types), little figures of satyrs or seilenoi, maenads, small masks, and not infrequently figured scenes (mugs with skeletons or fishermen). While the Egyptian type certainly began in the 3d century, or perhaps even at the end of the 4th, the Near Eastern category was later, starting not before the end of the 2d or beginning of the 1st century and continuing in the Roman age.

Gold- and silverwork. In the Hellenistic age the production of metal, and especially silver, vessels with relief decoration (pl. 195) expanded enormously. The new economic and social conditions and the spread of luxury among the new courts and upper classes favored this development. Even though most of the production has vanished, its popularity can be deduced from many references in the written tradition. Kallixenos of Rhodes (in Athenaios, *Deipnosophistai*, v, 196A ff.) records that innumerable vases of every kind — of gold, silver, and precious stone — appeared at a most sumptuous feast given in honor of Dionysos during the reign of Ptolemy II. Objects and vases of precious metals were among the gifts which that monarch sent to Eleazar, the high priest of the Temple in Jerusalem [Aristeas (pseud.), 51 ff.]. Epigraphs record that gifts of silver and gold vases were sent by Seleukos Nikator to Didyma (W. Dittenberger, ed., *Orientis Graeci inscriptiones selectae*, 2 vols., Leipzig, 1903–05, 214); that similar objects often were included among the votive gifts to sanctuaries is known from Hellenistic texts. Precious vessels appeared in great quantities at a banquet of Antiochos IV Epiphanes described by Polybios (Athenaios, v, 194C, 22). It is well known that victorious Romans transported vast numbers of precious vases to Rome from Magna Graecia, Sicily, and the Hellenistic East. For example, in 190 B.C., in the triumph celebrated by L. Scipio for his victories in Asia, 1,424 gold repoussé vases were displayed (Pliny, *Naturalis historia*, xxxiii, 148; cf. Livy, xxxvii, 159). An exceptional piece of evidence is given by a great bronze vase from Antium (mod. Anzio; Rome, Conserv.), which bears a dedication by Mithradates VI Eupator and which probably came from the booty of a Roman general returning from the east (Sulla, Lucullus, Pompey?). Between the end of the republic and the early Imperial age, rich Romans so desired to possess precious vases by famous Greek artists that a flourishing commerce developed in antiques, as well as a production of, and commerce in, forgeries. This Roman passion for silverware is indisputably confirmed by numerous discoveries of complete table services and single pieces, almost always of very high quality, in the small Campanian towns buried by the eruption of Vesuvius.

Little is known about the artists who worked with precious metals in the Hellenistic age. Pliny gives a bare account (*op. cit.*, xxxiii, 156) which in many cases leaves in doubt the chronology of the artists mentioned. There are some other isolated records and some names incised on existing silver pieces. Stratonikos of Kyzikos seems to have worked in the middle Hellenistic period and to have belonged to the Pergamene school; Boethos was active in the first half of the 2d century; and Pasiteles, Poseidonios, Hydistrachides, and Zopyros can be assigned to the age of Pompey. The name of Nikon is inscribed on a silver pyxis from Tarentum, of the 3d century B.C., and the names of Cheirisophos (cups from Hoby, Denmark), M. Domitius Polygnos (a vase from Boscoreale), and Apelles (two pairs of vases from the House of Menander in Pompeii) are engraved on later silver objects of the Roman age. Apelles, an *argentarius*, was a restorer of the vases from Pompeii (which are different in style) rather than the artist who created them.

A number of pieces coming from a Roman milieu provide information about Hellenistic metalwork. They are dated for the most part from the end of the republic to the beginning of the empire. The principal groups of these objects are from Bernay (Paris, Bib. Nat.), Hildesheim (Städt. Mus.), Boscoreale (Louvre), the House of Menander in Pompeii (pls. 195, 216); there are also numerous individual pieces and minor groups. For the rest of the Hellenistic age, however, documentation is relatively poor.

The products of metalwork created for the luxurious courts of Alexandria, Antioch, Pergamon, Macedonia, Pontos Euxeinos, and other centers has disappeared entirely; this fact must be considered in any evaluation of Greco-Roman metalwork in relation to that of the Hellenistic period. The lack of adequate means for comparison with earlier production is a serious obstacle to the assessment of the later production; thus it is difficult to judge the measure of its originality and the exact dates of individual pieces (certainly not all of the same time), and to answer the often recurring question whether the extant works are originals or copies. However, in the forms, in the figural repertory, and in the style, Greco-Roman toreutic art is largely in the genuine Hellenistic tradition; in fact, it could be said to be truly Hellenistic. The decoration of earlier Hellenistic silverwork is limited in most cases to the emblemata (inlaid ornament) inserted in plates, covers of pyxides, backs of mirrors, and other objects. The forms were generally busts and heads of various types (maenads, satyrs, divinities, portraits), but more complex subjects were used also, with the full figure and occasional landscape elements. Examples include a cover of a pyxis from Tarentum and plaster models of silver emblemata from Begram, certainly Alexandrian (pl. 195). Also from Begram is a model of an emblema decorated with those vines which generally covered vase surfaces. However, the use of figured decoration all around the sides of the vase (see, for example, the enameled ceramics of the same period which derive from metalwork) must also belong to the middle Hellenistic period; this use became widespread at a later date. The vases are believed to have been created often in pairs. Themes sometimes were taken from mythology or daily life; but the

motifs peculiar to Hellenism are those derived from nature — various plant forms, figures of animals, either isolated or depicted in a natural setting, and still-life subjects. Decorative motifs, even when they are figural, often are limited to the handles or to the juncture of handle and body (e.g., in plates, pitchers, cups). In these cases, the most distinctly Hellenistic features are the profusion of plant forms, the rather common introduction of landscape elements, an idyllic tone, a taste for genre scenes, and a vein of caricature. Metalwork was a rich source of inspiration for the more modest products of relief ceramics; its forms were repeated and its subjects were imitated and often mechanically reproduced; there are typical examples in Megarian vases, Calene ware, Apulian products, ceramics from workshops in Volsinii Novi (mod. Bolsena) and Volsinii Veteres (mod. Orvieto), and, later, in Arretine vases and the extensive production of terra sigillata. If our interpretation of the scanty historical evidence and of the data provided by the various finds is correct, then it seems that centers of Hellenistic metalwork must have existed in southern Italy (especially in Apulia), Egypt, Asia Minor (perhaps in Pergamon or on an island off the coast, such as Rhodes), Syria, northern Greece (Thessaly, Thrace, Macedonia), and southern Russia.

Some of the most beautiful Hellenistic silverware that has been recovered has been attributed to Apulian workshops, which probably had their principal center in Tarentum. These works include the Treasure of Taranto, emblemata from Canosa and Tarentum, and vases from Civita Castellana, Ancona, and other centers. This production dates mainly from the middle Hellenistic period and has the simple nobility of form of 4th-century art. The Rothschild pyxis (Treasure of Taranto), a work of major importance, has a cover with a relief of Artemis, Apollo, and Zeus on its exterior, and on the inside a vigorous floral motif in the form of a rosette. The name of the artist, Nikon ("Nikon epóiese"), is incised on its outer face. More decidedly Hellenistic are the emblemata on two plates from the same treasure; these emblemata show two small busts of Dionysos and Ariadne in a voluptuous embrace. Among the most beautiful silver pieces of the early Hellenistic age is a kantharos from this treasure, with its elegant, slender form, its luxuriant plant motifs around the neck and base, and the fresh grace of the two amphora-carrying cupids who appear below the juncture of the handles. An incense burner of high technical and stylistic quality has on its cover one of the most ancient examples of that bucranium and garland motif which was to be used throughout the Hellenistic and Roman ages and extensively in the Italian Renaissance. The emblema in the Jameson Collection (formerly Sir John Evans Coll.) is another fine example of Tarentine silverwork. Its vibrant maenad head with a rich vine-leaf crown is a work of exceptional stylistic vigor and perhaps dates from the end of the 4th century B.C. rather than later. The three hemispherical cups from Civita Castellana in Naples (Mus. Naz.) are superb products of the middle Hellenistic period and can certainly be attributed to Tarentine workshops. They have an opulent plant decoration in bold relief, the forms and design of which also appear on Megarian cups. A beautiful silver rhyton in Prague, dated about the end of the 4th or beginning of the 3d century, has also been attributed to a Tarentine workshop.

It is no longer possible to accept the opinion, widely held at one time (after the studies of Theodor Schreiber), that most of the oldest preserved silver treasures (Berthouville, Hildesheim, Boscoreale) are either Alexandrian originals or imitations; however, it must be admitted that Hellenistic-Roman Egypt was a very important center for the production of metal vessels. The previously noted evidence of the written tradition and, especially for the Roman age, the data of papyri, as well as objective evaluation of the surviving works, compels acknowledgment of this importance. Among these works are to be noted some groups of the middle Hellenistic period which predominantly reflect Egyptian traditions (the treasures of Mendes and Tuh el-Karmus); a pair of plates with emblemata from Hermoupolis, with two beautiful heads of Herakles and a maenad (Berlin, Staat. Mus.); a silver beaker from the Nile Delta with a Dionysian subject (perhaps of the Roman age; now lost); and a gilded silver beaker with cupids (or infant bacchants) gathering grapes (Alexandria, Greco-Rom. Mus.; from the early Imperial age but certainly of local tradition and manufacture). A Hellenistic bronze cup with landscape scenes (Alexandria; PL. 195) is of particular importance. With some plaster models it provides important evidence of the Alexandrian origin of such landscape representations, which were found throughout the Roman world. The numerous molds and plaster models for the manufacture and commerce of silverwork document the knowledge of Alexandrian toreutic art. Almost all either have been found in Egypt (especially in Memphis) or probably come from that country (the discoveries in Begram, Afghanistan). Moreover, many ceramic works with relief decoration that have been found in Egypt are obvious derivations or copies of metal models (Megarian cups and enameled terra-cotta vases).

The iconography and the relationships with products of proved Egyptian provenance justify the attribution to Alexandrian workshops of numerous vases found in other places, or of unknown origin [the Boscoreale phiale with the bust of Alexander; an emblema formerly in the Czartoryski Coll., Goluchow Castle, Poland, with the Tyche of Alexandria; a pair of beakers from Boscoreale with a parody scene of skeletons of Hellenistic poets; a kalathos from Herculaneum with a Homeric allegory; a landscape cup from the House of Menander in Pompeii (PL. 216); silver and bronze vases with relief representations projecting from the handles in the form of birds' beaks, etc.]. The silver vase from Stevensweert (Netherlands) with Dionysian relief motifs could be a product of Alexandrian metalwork of the 2d century B.C. (According to other opinions it is Siceliot.) The revival of the old Egyptian technique of niello, which often employed a Greco-Egyptian repertory in vases of the Hellenistic and Roman periods (e.g., vases of Egyed in Hungary), should evidently be attributed to the workshops of Hellenistic-Roman Egypt. No one has so far undertaken a close study of this evidence. According to present knowledge, the technique extended through the Hellenistic age and beyond. It reveals a most varied production, in which are reflected the diverse tastes of Alexandrian art: those of the Egyptian tradition, of Greco-Egyptian eclecticism, and of purely Greek origin. Some of the most beautiful Alexandrian silverwork of completely Hellenistic character is known through such plaster models as the emblemata with portraits of the Ptolemies (Ptolemy I and Berenike, Alexandria, Greco-Roman Mus.; Ptolemy I, Ptolemy II, and Ptolemy III, Hildesheim), the emblema with the head of a poet or philosopher (from Begram), models with landscape elements (in Munich; in London; from Begram), models with plant motifs (from Memphis and from Begram), and others.

More obscure is the subject of Syrian and Iranian metalwork, successor to the metalwork of the Achaemenids, which also had a great flowering in the kingdom of the Seleucids during the Hellenistic age. Of the great quantity of gold and silver vessels used by the Seleucids, only a few isolated pieces survive. Three gilded silver emblemata (Czartoryski Coll.), attributed to the Hellenistic age, come from Syria. Some gold and silver cups from Nihawand (Persia) and from Siberia, which are close to Megarian types, are authoritatively assigned to early Hellenistic Seleucid metalwork, as is a phalera of unknown provenance (Leningrad, The Hermitage), with a representation of a war elephant. A silver emblema with a portrait of Antiochos VII Sidetes (?) is representative of late Hellenistic metalwork. Found in Syria but of foreign origin, an emblema formerly in the Loeb Collection may be Tarentine, and a bronze cup of Megarian type from Ras Shamra is perhaps Egypto-Alexandrian.

We know very little of Pergamene production, but it must have been notable. Two very beautiful emblemata (Berlin, Staat. Mus.), of the first half of the 2d century, come from Miletopolis near Pergamon. One bears a fine portrait of Demosthenes, the other a superb mask of Seilenos. The latter shows stylistic similarities to some of the heads of the great Pergamon frieze and is even closer to other works of the Near Eastern-Pergamon school such as the *Hanging Marsyas* (the Istanbul replica). Some metal vessels found in southern Russia

and in the Roman world are considered to be of Pergamene origin, and a certain reflection of Pergamene work can be recognized in some ceramic relief products. The great plate of Athena from the Hildesheim Treasure and a superb cup from Pompeii with Triton and Nereids (PL. 195) are among the works probably attributable to (or inspired by) Pergamon. In the former there are echoes of Pergamene seated statues and coin representations, while in the latter the fullness of the bold relief and the emphasis on plasticity and pathos present singular similarities to the taste which inspired the great frieze.

Material from the Greek mainland is also scanty. This includes the small treasure from Metropolis (Thessaly) of about 200 B.C. [golden bracelets; a silver vase in the form of an alabastron, with relief decoration of dancing Erotes (above) and Dionysos with the nymphs of Nysa in a landscape (below); a silver pyxis with dancing maenads, precedents of Neo-Attic types]; small, undecorated silver vases from Gormenion (mod. Goritza); gold medallions and a gold *naiskos* (shrine) from Thessaly (see below).

The Greco-Pontic toreutic production, which was plentiful in the classic age, continued in the Hellenistic era, but it was less flourishing. The elegant forms of some early Hellenistic pieces (skyphoi, kantharoi, phialai, and pyxides) are closely related to traditional types of late Attic black-glazed ware. These pieces have, in general, only relative interest, as their relief decoration is limited to sober floral motifs on the foot, neck, or shoulders of the vase.

For historical and stylistic reasons, mention should be made of Roman work in precious metals from Pompeii, Herculaneum, Boscoreale, and other centers. In more than one case, it is certain that among the finds are pieces of various periods preceding that suggested by the excavations themselves. These works would include the pieces which the ancients considered *argentum vetus* (old silver). The Treasure of Berthouville is a typical example: it was buried in A.D. 275 but includes much silverwork of the early Roman Imperial age and some that very probably is of the Hellenistic age. Unfortunately the present state of knowledge does not permit clear discrimination of earlier works from those of more recent date found at the same sites. Although such works as the emblema on the large plate of Athena in the Hildesheim Treasure, the pair of cups with still-life motifs in the Treasure of Boscoreale, and the pair of cups of similar form with scenes from the myth of Dionysos and Semele, from the House of Menander, seem more surely datable to the Hellenistic age, there is the greatest uncertainty regarding the dating of a great many other works. Observations on the forms of the vase and of the relief decorations, which tend to become heavy and to lose their freshness and elegance, sometimes can be useful, but this criterion is rather fluid and subjective. However, if a precise chronological distinction between Hellenistic and older Roman products is difficult and often impossible, a comparison on the stylistic level would be absurd in the majority of cases. Such works as the landscape cups from the House of Menander, the two pairs of cups with centaurs, female centaurs, and cupids from the Berthouville and Pompeii treasures, and the several vases decorated with branches of olive, plane, and vine, from the treasures of Hildesheim, Boscoreale, and Pompeii, also may have been conceived and executed in the Roman age. Nevertheless, in form, subject, and style they are in the purest taste and most vital tradition of Hellenistic culture. On the whole, the silverwork executed toward the end of the republican and beginning of the Imperial ages must be considered expressions of late Hellenistic toreutic art and of its prolongation into the Roman age.

The repertory of figural subjects is characterized by a taste for epigrammatic allusions (centaurs and centauresses with Erotes; Dionysian sprites riding panthers, lions, or elephants), as well as by a taste for genre subjects, caricature, and the grotesque (the boatman, the peasant with his cow, the sacrifice before a country shrine, the sorceress, and skeletons of celebrated poets and philosophers). There was a particularly strong feeling for nature, and entire vase surfaces were covered with branches, fruit, and garlands, sensitively rendered with a keen sense of naturalism. The interest in nature frequently led to the introduction into figural compositions of such elements as trees, plants, small shrines, and rocks, occasionally transforming the scenes into veritable landscapes. Artists still turned to myth and legend for subjects, but they emphasized those aspects nearest to human passions; the world of Dionysos and that of Aphrodite and episodes from the Homeric cycles were the most common sources of subjects. The formal idiom was richly varied, and the wide range of approaches includes both vigorous plastic sensibility and pictorialism; forms which are clearly separated and those articulated by emphatic chiaroscuro contrasts; delicate rendering in the style of miniatures and the broad rendering of powerful volumes. A silver cup from Ingolstadt, decorated with scenes of the Ilioupersis (1st cent. B.C.; Munich), merits special consideration, as it preserves the likeness of a pictorial composition of excellent quality from the late 4th–early 3d century B.C. Also worthy of mention are two silver kantharoi from the first half of the 1st century B.C., if not earlier: the kantharos from Alesia (mod. Alise Sainte-Reine), with relief decoration of myrtle branches (VI, PL. 254), and the Corsini vase, from Antium (mod. Anzio), with a representation related to the myth of Orestes. The latter may be connected with the work of Zopyros (Pliny, *op. cit.*, xxxiii, 156), an artisan of the time of Pompey, and may have been inspired by a 4th-century painting by Timanthes. Metalwork is one of the fields of artistic production in which Hellenistic themes and stylistic ideals were clearly and extensively perpetuated in the late-antique and Byzantine ages. Satyrs, maenads, bucolic themes, and scenes of hunting and fishing continued to adorn vases; frequently these were rendered in styles so close to those of Hellenistic art as to raise the question whether such pieces may not be Hellenistic rather than late works. Examples include a small vase from Alexandria, with a similar subject (Br. Mus.).

The metalwork considered up to this point has been primarily silver, often with parts, varying in prominence, covered with gold. That the production of gold vases was smaller is evidenced by the sparseness of the finds and by the testimony of Pliny, who gives the names of silver-vase makers but observes that the names of gold-vase makers have not been preserved. The fact is that gold was used chiefly for jewelry of every kind: bracelets, rings, diadems (VI, PL. 242), necklaces, and fibulas, which were made in immense quantity and often in the most refined taste and technique. Some medallions of divinities (Artemis, Aphrodite, and Athena; PL. 195; VI, PL. 253) from Thessaly (Nat. Mus. and Benaki Mus., Athens; Princeton, Univ. Art Mus.) are of gold; some plaster models of them were found in Egypt. A beautiful golden naiskos with a favorite motif of Hellenistic sculpture, Dionysos leaning on a satyr, also comes from Thessaly. The medallions and the naiskos have been assigned to the 3d century B.C. A treasure of sumptuous gold vases, perhaps from the second half of the 4th century, was found in 1949 at Panagyurishte, Bulgaria (VI, PL. 255). Its date raised some discussion (H. Hoffmann assigned it to the late-antique period); however, the very provincial forms and style are of the late classical age rather than the early Hellenistic period.

GEMS AND GLYPTICS. The wealth of the courts and the general spread of luxury favored Hellenistic production of gems and jewels; in addition to a renewal of the traditional production of incised stones, there appeared the splendid cameo worked in relief. Work ranged from the simple ring bezel to the sumptuous vase decorated with relief. There is much literary and epigraphical evidence to testify to the wide distribution, under the increasing influence of the East, of the use of precious stones to increase the splendor of vases, jewelry, crowns, household goods, and even clothing, as well as of entire vessels carved of precious stone. According to Appian (*Mithradates*, 115), the Romans found, among other things, in Mithradates' treasury about 2,000 onyx vases adorned with gold. Although much of Hellenistic glyptic work is lost, a large number of incised gems and cameos have survived (PLS. 37–39). Many of these can be counted among the most exquisite and significant expressions of the art of that time. The production of Hellenistic gems can be distinguished even less than other fields of

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

artistic endeavor from the production of the Hellenistic-Roman period, which was a direct continuation of the Hellenistic era. Even for the expert eye of the specialist, it is often difficult to establish whether a gem should be dated to the Hellenistic or Hellenistic-Roman period. (The latter covers the end of the republican and beginning of the Imperial eras.) The Hellenistic gem is usually characterized by an elongated oval form with decoration incised on the upper, convex part. The preferred stones were garnet, hyacinth, emerald, beryl, topaz, amethyst, sardonyx, and carnelian. Translucent stones of several layers, especially the different varieties of sardonyx, were preferred for the cameo, but such transparent stones as rock crystal, amethyst, and garnet were used as well. Glass paste was often substituted for precious stones. The choice and workmanship of the materials aimed to obtain the greatest effects of transparency, luminosity, and polychromy and seem to have served the artistic ideals of the epoch particularly well. These ideals were further reflected by the cutters in the choice of subject and the treatment of form. Among the favorite mythological subjects were those taken from the cycle of Dionysos and his thiasos, Aphrodite, Psyche and Eros, Apollo and the Muses, or such divinities of Near Eastern origin as Serapis and Isis. Subjects from daily life also appeared frequently; and individual motifs of animals and plants were employed. Portraiture was particularly popular and was given impetus by the use of gems as personal seals, which became common in this period and was to survive in the succeeding period. Hellenistic glyptic art is also a faithful mirror of the art of the time. Although several 4th-century forms survived, all the new tendencies of Hellenistic art were present in glyptics — a taste for full and fleshy modeling as well as for delicate pictorialism, a tendency toward vivid naturalistic observation and emphasis on pathos, reflections of the more grandiose baroque style and those of the fragile rococo (which was to be particularly popular in the Hellenistic-Roman period), and, at a certain point, the affirmation of classicizing and archaizing tendencies. One of the particular characteristics of this period was the extraordinary technical refinement with which its stylistic concepts were often realized.

Many of the engravers of Hellenistic cameos and gems are known from their signatures: Athenion, Boethos, Daidalos Lykomedes (VI, PL. 37), Onesas, Pheidias, Protarchos, Sosis, and numerous others, among whom is that Dioskourides who executed the seal of Augustus (Pliny, *Naturalis historia*, XXXV, 2, 8; Suetonius, *Octavius*, L); several of his signed works are extant (VI, PL. 38). Some scholars attribute to him the so-called "Gemma Augustea" (VI, PL. 39) and two celebrated cameos with the head of the Emperor, the Strozzi Cameo in the British Museum and the Evans Cameo in the Metropolitan Museum. Dioskourides and his three sons, Eutyches, Herophilos, and Hyllos, were among the numerous Greek artists who brought a strong wave of Hellenism to Italy between the late republican and early Imperial ages. The impact of this vigorous trend submerged local glyptic traditions. The Hellenistic fashion was so popular that the execution of gems with portraits of illustrious Romans (Brutus, Caesar, Gnaeus Pompey, Sextus Pompey, Maecenas, and Agrippa) was commissioned to Greek artists, and artists who are known to have been Roman signed their works with Greek letters (Aulos, Gaios, Cnaios, Leukios or Lucius, Kointos or Quintus, Roufos or Rufus, and Saturneinos). Particularly Roman subjects are often clearly conceived in ways which have their origins in the world of the Hellenistic monarchies (Augustus with an aegis and diadem, in the fashion of the Diadochi; Augustus beside the personification of Rome, as an heir of the Ptolemies or the Attalids, with the traditional symbols of these princes).

The engraver Onesas seems close to the classic ideals of the 4th century. Three pieces are signed by him: an intaglio with the figure of Athena (Br. Mus.; Furtwängler, AG, III, pls. 14, 43; Walters, 1926, no. 1143); a work with elegant figures of Muses, in glass paste (Florence, Mus. Arch.; Furtwängler, *op. cit.*, III, pl. 59, 3); a carnelian with a head of Herakles (Florence, Mus. Arch.; G. Lippold, 1922, 35, 2). Formerly attributed to Bryaxis, the fine cameo with the head of Serapis, in Naples (Mus. Naz.), is by an anonymous artist and also expresses classic ideals. The cameo with the head of Ptolemy I has all the interior fire of Lysippian works, but its forms are fully Hellenistic and forecast the baroque phase of Hellenistic art (Vienna, Kunsthist. Mus.; Furtwängler, *op. cit.*, 59, 3). The heroic portraits of Alexander often inspired (as in coins) the portraits of his princely successors or of private individuals, which repeat such characteristics as the long, curled locks and the upturned glance (Lippold, 68, 5 and 6; 68, 2 and 4). More often the portraits are marked by an incisive realism (Lippold, 69, 2, 3, 6; 70, 1). The delicate modeling of Alexandrian pictorialism is recalled by a chalcedony in Paris (Bib. Nat.) with the head of a Ptolemaic queen, but the gem with the head of a queen with long, Libyan curls is close to types, of the same eclectic taste, modeled according to late Hellenistic concepts. The latter work is signed by Lykomedes (Furtwängler, *op. cit.*, 32, 31). The Alexandrian taste for small pictures with bucolic and landscape elements is revived in a large cameo in Berlin depicting the Judgment of Paris, which has fine color effects. Near Eastern baroque conceptions and forms inspire the large Leningrad Cameo (Lippold, 3, 1); the cameo in Venice with the head of Zeus (from Ephesos; Lippold, 3, 2); the cameo in Naples (Mus. Naz.), signed by Athenion, with a quadriga bearing Zeus in the battle with the Giants (Lippold, 3, 4); and an amethyst, formerly in the Laurenti Collection, with a Medusa head (Furtwängler, *op. cit.*, 59, 2). Among the cameos with portraits of princes, the two sardonyx pieces in Leningrad (The Hermitage; Furtwängler, *op. cit.*, 53, 2) and in Vienna (Furtwängler, *loc. cit.*, 1) stand out because of their unusual size, the beautiful polychrome effects, and the nobility of style. They show a pair of monarchs of the early Hellenistic age, perhaps two Ptolemies; identification of the subject is uncertain. Among Hellenistic examples of cameo art applied to figured vases two important pieces have miraculously survived, the so-called "Tazza Farnese" and the so-called "Ptolemy Cup" (Paris, Bib. Nat.). The outer surface of the bottom of the "Tazza Farnese" (a sardonyx in two strata) is completely covered by a large mask of Medusa (VI, PL. 38); the interior of the vase comprises a celebration of the fertility of the Nile (PL. 196). In the "Ptolemy Cup" two very similar, rich compositions, Dionysian and Eleusinian in content, appear on the two opposite faces. A *trapeza* (table) with vessels and objects of worship is depicted under a pergola in the shade of an awning. A number of tragic and comic masks appear along with votive gifts suspended from branches and lying on the ground. The scene is enlivened by a panther, a goat, and some flying birds. The subject of the "Tazza Farnese" is typically Egypto-Alexandrian, but in the "Ptolemy Cup" it is the interest in landscape elements, the idyllic and bucolic spirit which the sacred landscape acquires, and some figure motifs that indicate Alexandrian origin. These two great cameos can be considered among the most significant expressions of Alexandrian art, and this evaluation will remain valid even if those who judge them to be of the Roman age are proved correct.

COINS. In the Hellenistic age the Greek or Hellenized type of coin spread throughout the ancient world — through the great and small Hellenistic kingdoms and to the peripheral and semibarbarous countries and those far from the centers of Greek civilization. These areas ranged from Mauretania, Numidia, and towns of Spain to Bithynia, Pontos, Parthia, India, the Celtic populations of the east and west, and to Rome, as well as to Macedonia, Pergamon, Syria, and Egypt. The political and economic physiognomy of the Hellenistic world is wonderfully expressed in its coinage; the autonomous coins of the old city-states tended to disappear and to reflect the vicissitudes of the losses and ephemeral reconquests of civic liberty. The coins of the new kingdoms, especially the more powerful ones, were used in wide areas. The great iconographic innovation was the portrait of the monarch on the obverse; the fashion derived from the east, spread through all the Hellenistic kingdoms to Rome, and has survived to modern times. (Coin portraits constitute a valuable source for the study of Hellenistic iconography.) The representations on the reverse, stylistically inferior, are often crowded by a long legend with

the titles of the prince. Generally the initials of officials who supervised the coinage appear on coins along with the mint marks. (There often were several mints in the same realm.) Often included as well are the dates of a reign.

The dating of Hellenistic coins is by no means invariably easy. The information provided on coins is often very uncertain. Iconography taken by itself can be misleading, because several coin types with portrait heads were repeated many times in successive ages, and some continued through the entire Hellenistic age (e.g., the coins of Alexander, those of Lysimachos with the head of Alexander, those of Ptolemy I, Ptolemy II, and Arsinoë II). Cities with the right to mint coins often issued, in addition to their own local coinage, other types bearing portraits of monarchs to further economic or political aims (e.g., Carthage and Tarentum). In general, the coins of cities are stylistically more conservative and perpetuate or revive the noble traditions of classical coinage. The coins of Syracuse, southern Italian cities, and, farther afield, those of some Asiatic towns are, even as late as the period of the 3d and 2d centuries B.C., among the finest of Greek production. In the East the mints of Bactria, Bithynia, and Parthia produced some of the most beautiful coin portraits of the Hellenistic age. In other countries whose coins have an Oriental look, kings are represented in exotic costumes; on the reverse, small figures of local subjects are introduced, and legends are written in the native language.

In general, of course, the style of coin portraiture reflects the art of the time; nevertheless, caution must be employed when using coins to study large-scale sculpture, because, in general, even portrait coins must have been rather conservative in style, if not actually behind the times, and because the style of earlier coins, which were often used as models, could not but influence the style of newer coins. Yet coin portraits do reflect the same tendencies, tastes, and signs of stylistic change that can be observed in contemporaneous sculpture. Thus the portrait of the monarch depicted as a hero is very popular in early Hellenistic coins inspired by the ideals of the portrait bust of Alexander. The Hellenistic taste for realistic portraiture is present in the majority of coins; sometimes it is a restrained realism of subtle psychological penetration, sometimes a more harsh and unsparing realism. As in sculpture, forms are structurally more unified and powerful at the beginning of the period, more slack and weak at the end; there are images modeled so as to create moving and dynamic form, and others modeled with a delicate and refined pictorialism. Macedonia, Bosporus Cimmerius, and some of the satrapies of Asia Minor produced coins that were precedents for Hellenistic portrait coins. The coin portraits of Pharnabazos from Phrygia, of Tissaphernes from Lydia, and of Orontes from Mysia frequently have a high esthetic value. An important precedent for the strongly realistic portrait is the wrinkled and strong head of an old man (Timotheos?) that appeared on a coin of Kyzikos as early as the first half of the 4th century B.C. Alexander added the title of "basileus" to his coins after the conquest of Persia. The title was retained by Philip Arridaios, while the Diadochi inscribed it on their coins only after their assumption of the title of king (300 B.C.). At first they used the head of Alexander-Herakles with a lionskin or the head of Alexander with an elephant skin and with the horns of Zeus Ammon. Later they introduced their own portraits; Ptolemy I put his portrait on a coin type which was to last throughout the Lagid dynasty. On the reverse of the royal coins images of divinities, allegorical personifications, and dynastic insignia (e.g., the eagle of the Ptolemies) appeared together with the royal titles. Occasionally the reverse recorded historical events, which were sometimes also commemorated on the obverse (e.g., coins of Demetrios I Poliorketes depicting Nike on the prow of a ship, commemorating the defeat of Ptolemy I at Salamis in 306 B.C.; III, PL. 396).

With the expansion of Roman power the royal coins gradually disappeared. Coins of individual towns survived for a long time or were revived, and these towns often adopted the widely distributed coin types of Alexander, adding their own crests and the names (or initials) of their magistrates. About 200 B.C. a certain type of coin, the *kistophoros* (Lat., *cistophorus*; see below), was first minted; it survived through almost the entire 1st century B.C.

*Macedonia.* Philip II initiated Macedonian coinage on a national scale (many mints, and the first great issue of gold coins); many types were widely copied later, from Asia Minor to Gaul, Britain, and Germany. The more common obverses were the head of Zeus with a laurel crown, the head of Apollo, and the head of Herakles with a lionskin. Alexander created some types which were coined in various areas as he added them to his empire. (There were Macedonian mints in Asia Minor, Cyprus, Phoenicia, Egypt, and Babylonia.) These coins were distributed widely even among the semibarbarous tribes of eastern Europe and were to continue almost unaltered for centuries. By far the most common coin was the "Alexandrine," which bore the head of a young Herakles with a lionskin on the obverse and a seated Zeus Aetophoros on the reverse. As mentioned above, the epithet "basileus" was eventually added to the name of Alexander. The image of Herakles, which had appeared on the coins of Philip II, must, then, have acquired the character of an idealized image of Alexander as Herakles. The most important aspects of later Macedonian coinage include the appearance of the portrait and name of the monarch accompanied by the title "basileus," (coins of Demetrios I Poliorketes); the introduction of commemorative coins (the naval victory of Salamis, issued by Demetrios); the frequent appearance, on the obverse of coins beginning with Antigonos II Gonatas (283–239), of the Macedonian shield in whose center was a profile head (of Pan, King Perseus, or Artemis); portraits, which are among the most refined of all Hellenistic coinage, on the coins of Philip V (220–179; PL. 196; III, PL. 397) and of Perseus (179–167); the frequent presence of Athena Promachos, executed in an archaizing style, on the reverse of coins (Demetrios, Antigonos II Gonatas, and Philip V); the issue, between 158 and 148 B.C., of coins for each of the four divisions of the country established by the Romans after 168 (the defeat of Perseus at Pydna), with "Makedonon protes," etc., on the reverse; and, finally, the issue of coins of Macedonia as a Roman province (after 146 B.C.).

*Kingdom of Lysimachos, including Thrace, Crimea, and western Asia Minor.* Until 303 B.C., Lysimachos, ruler of Thrace and Crimea, minted coins exclusively of the types of, and in the name of, Alexander. After the Battle of Ipsos (301 B.C.) there was a large issue from several mints in Asia Minor of coins of the same type but with the name of Lysimachos and his insignia (the forepart of a lion). In 297 a splendid new coin type was issued which enjoyed great popularity even after the death of Lysimachos (281 B.C.). It bore a heroic portrait of Alexander as the son of Zeus Ammon on the obverse and Athena Nikephoros enthroned on the reverse.

*Pergamon.* The first Pergamene coins, issued when Philetairos was still custodian of the famous treasure of 9,000 talents entrusted to him by Lysimachos, are like the last described type of the coins of Lysimachos. When Philetairos proclaimed himself independent, passing under the protection of Seleukos I Nikator, he adopted the coin type of Alexander with the legend of Seleukos. Then he adopted a coin with the image of Seleukos on the obverse and the seated Athena of Lysimachos' coins on the reverse but added his own name. The strong portrait of Philetairos was to appear on the very beautiful coins of Eumenes I (263–241 B.C.), which bore the usual type of Athena with the name of Philetairos on the reverse. The same type was adopted by Attalos I (241–197), Eumenes II (197–ca. 160), and Attalos II (ca. 160–138); Attalos III does not seem to have issued coins at all. At the time of Eumenes II coins were also issued with the portrait of the king (obverse) and a pair of standing youths (Dioskouroi or Kabeiroi) with the name of Eumenes (reverse). During the reign of Attalos II a coin was minted in Pergamon (with the abbreviation II E P) of a type which seems to have originated in Ephesos. This type became a kind of Pan-Asiatic coin, especially among the cities of western Asia Minor (e.g., Pergamon, Ephesos, Smyrna, Nysa, Stra-

tonikeia, and Tralles) and were still issued in the Roman age. These coins are the *cistophori*, so called because of the *cista mystica* (ritual container) which decorated the obverse.

*Syria.* The coinage of the long series of Syrian monarchs began with Seleukos I Nikator (321–280), founder of the dynasty. He first adopted the usual types of coins of Alexander and introduced his own name in issues after 306 B.C. In the new types Seleukos I was depicted with bull horns (on the reverse was the head of a neighing horse) or wearing a helmet (reverse with Nike in the act of crowning a trophy; III, PL. 396). Some of his coins issued after the battle at Corupedion (281) have the head of a neighing horse with horns on the obverse and an elephant on the reverse. Others, which may commemorate the Indian campaign, have the head of Apollo or Zeus on the obverse, and Artemis and Athena in elephant chariots on the reverse. Between the death of Seleukos (280 B.C.) and the year Syria became a Roman province (64 B.C.) several internal and external wars occurred, there were losses, conquests and reconquests, and dismemberments of territory, and some thirty monarchs succeeded one another. Most were named Seleukos, Antiochos, or Demetrios, generally accompanied by an attribute or epithet. Their portraits constantly appeared on the obverse of coins (PL. 196), and on the reverse most frequent were such motifs as Apollo seated on the Omphalos, or sometimes standing with the *kithara* (cithara), Zeus Nikephoros enthroned, the eagle with a thunderbolt, Tyche or Demeter enthroned; occasionally there were figures alluding to the East, such as an elephant, Sandas' pyre, a helmet surmounted by a tall horn, or the goddess Atargatis. Sometimes the image of a divinity appeared on the obverse (Athena, Apollo, or Zeus). Among the more important representations of Syrian monarchs were those of Demetrios II Nikator (in his second reign, 129–125), who was the only one to appear in a beard, and Cleopatra Thea (125–121), who was successively the wife of Alexander I Balas, Demetrios II Nikator, and Antiochos VII Sidetes, and the only Syrian queen represented on coins, where she was depicted alone or with her son Antiochos VIII. The large quantity of Syrian coins permits us to follow their evolution and progressive decadence. The most beautiful coins are those of the 3d century and of the first half of the 2d. Among them the coins of Seleukos I Nikator, Antiochos I Soter (especially those which represent him in old age), Seleukos II Kallinikos, Antiochos Hierax, and Antiochos III of Syria (III, PL. 396) excel in their incisive power, sureness of design, richness or delicacy of modeling, and effectiveness of psychological penetration. In general, the plastic beauty of Syrian coins later diminished, resulting in the stylistically weak images of the last monarchs and the defacement of inferior designs of the reverse by certain long legends invading the field from all directions. In the portraits of rulers the interest in facial characterization survived for a long time; certain coins of Demetrios I Soter (162–150), Alexander I Balas (150–145), Antiochos VII Sidetes (ca. 138–129), Antiochos VIII Grypos (125–121), and Antiochos IX Kyzikenos (115–95) were still of notable power and fine quality.

*Egypt.* The coinage of the Ptolemies of Egypt was less rich in variety of types, but very often it was of greater stylistic quality than Seleucid types. The most beautiful coins are without doubt those issued by Ptolemy I Soter (323–285; III, PL. 396) both as satrap and as independent monarch. The first coinage comprised the types of Alexander IV and Philip Arridaios, but soon (perhaps after 316) Ptolemy substituted (the first of the Diadochi to do so) the head of Alexander with an elephant skin for the traditional head of Herakles. At first the usual reverse of Zeus Aetophoros was paired with the head of Alexander, while later a splendid archaizing figure of Athena Promachos was used. For the first time, on some of these issues, appeared the name of one of the successors of Alexander ("Ptolemaiou"). Ptolemy I was also the first (after 305 B.C.) to have his own image put on the coins of the kingdom — a magnificent, vigorous head with a diadem. On the reverse of the coin was the symbol of the eagle on a thunderbolt. The type was imitated widely in coins of other countries, and after the death of Ptolemy I (285 B.C.) the successors still reproduced this type extensively.

Among the new coins of Ptolemy II were those with the head of Arsinoë II Philadelphos (with an eagle or a double cornucopia on the reverse), and those having portraits of Ptolemy II and Arsinoë II Philadelphos (legend: "Adelphon") on the obverse, and of Soter and Berenike I (legend: "Theon") on the reverse. Among the coins of Ptolemy III were the one with the portrait of Berenike II, daughter of Magas, which seems to have appeared on coins of Ptolemy II as well (reverse bears a cornucopia and the name of the queen), and the coin with a head of Ptolemy III with a diadem and nimbus along with an aegis, trident, and scepter (III, PL. 396; reverse has a cornucopia and the name of the king). Another coin of the same king shows his head with only the diadem (reverse bears an eagle); it is broader and more powerful in style than the precise, minutely rendered head with the nimbus. Fine realistic portraits of Ptolemy and his queen, Arsinoë III, still appeared on the coins of Ptolemy IV (221–203), but the coins of Ptolemy V (203–181) were less significant and weaker in style, and those of his successors showed progressive decline. In the Ptolemaic as in the Syrian coins, the portraits (both the new ones and those repeating old types) became increasingly inferior in quality — in the general composition, in the flaccid and disintegrating forms, and in execution. However, strongly individualistic portraits still appeared occasionally in some rare coins of Ptolemy VI from the Ptolemaic mint in Palestine and of Cleopatra VI from the mint in Ascalon (Ashkelon). The portrait of the queen appeared coupled with that of Mark Antony on the coins of Antiochia. In general, it may be said that the most beautiful Ptolemaic coins were those of Ptolemy I. Something of the grandiose style of his profiles reappears in some coins of Ptolemy III (from the mints of Lebedos in Asia and Ainos in Thrace). In the original issues, the images of Arsinoë II Philadelphos show a broad and solid style, while those of the more common coins of Berenike II and Ptolemy III were executed in an excessively minute and careful technique. On the other hand, some of the heads of Ptolemy IV, Ptolemy VI, and Cleopatra displayed a certain tendency toward realism. In general the traditional types of the reverse — the simple or double cornucopia and the eagle on the thunderbolt — long maintained a sober elegance and fine composition, even in the arrangement of the legends; but the process of progressive weakening and structural disintegration affected them also.

*Minor Hellenistic kingdoms.* The minor Hellenistic kingdoms (Bithynia, Pontos, Cappadocia, Armenia, India, Bactria, Parthia, Syracuse under the dynasty of Hieron II, Numidia, and Mauretania) produced coin series which often prove to be of great artistic as well as historical interest. The most artistically significant coins of the kingdom of Bithynia (297–247 B.C.) are those of Nikomedes I (278–250), which bear a handsome portrait of great realism, presaging that of certain portraits of Bactrian kings; and the beautiful coins of Prusias I, some of which tend toward idealization, others toward greater realism, but almost all characterized by great refinement and a soft, moderately coloristic modeling (III, PL. 396). These qualities are partially preserved in the coins of Prusias II (192–148) and Nikomedes II (142–91), but with a timid return to the heroic tone of early Hellenistic portraits. As usual, the reverse sides are not so beautiful as the obverses; the reverses, for the most part, reproduce the image of Zeus Stratios of Nikomedia, perhaps after the statue by Doidalsas. Among the coins of the kingdom of Pontos, those of Mithradates III (246–190), Pharnakes I (ca. 183–170), and Mithradates IV (ca. 170–150) display a clear, incisive realism achieved by fine workmanship. Those of Mithradates VI Eupator (120–63) tend to revive the heroic portrait, but in the idiom of the centrifugal style of the time. On the reverses of these coins appear the traditional type of Zeus Aetophoros enthroned, a standing male pantheistic divinity, a kind of Hermes-Dionysos, and a grazing stag or Pegasos drinking from a spring, the scene framed within a ring of ivy. Among the long series of coins issued by the successive kings and dynasties of Cappadocia from the end of

the 4th century B.C. (Ariarathes I) to the beginning of the 1st century of our era (Ariarathes X, 42 B.C.–A.D. 17) there are few of genuine stylistic value. Those of the pretender Orophernes (158–157) present a beautiful head with diadem in a noble, classicizing style. Those of Ariarathes IX, son of Mithradates VI of Pontos, repeat the heroic type of the one just mentioned, and some coins of Ariarathes X display a lively realism and notable delicacy of execution. The series of coins of the kings of Bactria (250–135) presents some of the most lively portraits and at times the most unsparing realism of Hellenistic coinage. Among those that stand out are the coins of Diodotos, first a satrap of the king of Syria and later independent (250 B.C.); those of Demetrios (who extended the borders of the kingdom into India), whose powerful head was frequently portrayed with an elephant skin; those of Antimachos, with an incisive profile, a diadem, and a large-brimmed hat (III, PL. 398); and the strongly realistic ones of the last Greek dynast of the region, Heliokles. The reverses of the Bactrian coins are also particularly fine (Zeus hurling a thunderbolt, Herakles sitting or standing, the Dioskouroi). The coins of Armenian, Indian, and Parthian kings are characterized by the encounter of iconographic traditions and Greco-Oriental tastes (the latter always more accentuated). The Parthian coins with portraits of Mithradates I (171–138), Phraates II (ca. 138–128), and Artabanos I (ca. 128–123) excel for their delicacy and stylistic purity. An interesting detail to be noted is that busts on the coins of Mithradates III of Parthia (56–55) are represented frontally.

The coins of Hieron II and his family and those of the kings of Numidia and Mauretania also figure in the numismatic history of the Hellenistic kingdoms. Agathokles (316–289) was the first tyrant of Syracuse to issue coins in his own name, and Hieron II (ca. 270–215) was the first to place his own portrait on coins. Syracusan coinage was then influenced strongly by Ptolemaic types. In addition to the youthful head of Hieron II with diadem, the veiled head of Philistides (his wife) and the heads of Gelon and Hieronymos (216–215) also appear on Syracusan coins. The reverse sides, often of unusual beauty, reflected the old traditions of classical coinage (traditions also followed on the obverse sides of other coin types of the reign of Hieron). The older traditions are reflected in the composition and choice of subject (Nike in a biga or quadriga; a galloping rider); the Ptolemaic symbols of the eagle and the thunderbolt were used as well. The coins of the kings of Numidia and Mauretania are generally of semibarbaric taste and poor technical quality; they are of very slight artistic interest.

*City coins.* The coin production of the Greek city-states (which more or less preserved their independence, real or apparent, for a long time, and consequently the right to mint their own coins) is a secondary phenomenon, compared to the development of the new coins issued by the various kingdoms, especially the more powerful of them. Nevertheless, from a qualitative point of view the coins of independent cities, which generally could boast a long and glorious tradition of numismatic art, maintained a notably high level, particularly in the early period.

Of great numbers of coins minted by Greek cities of the east (Knidos, Rhodes, Kyzikos, Ephesos, Magnesia, Elis, Gortyna, Hierapytna, and Amastris) during the end of the 4th century and the first decades of the 3d, there are coins of great stylistic beauty and fine execution. Those of Amastris (Paphlagonia) with a head of Mithras are in the noble traditions of 4th-century idealism. Those of Kios (Bithynia), Ephesos, Knidos, and Cyrene, with heads of Apollo, Artemis, Aphrodite, and Zeus Ammon, respectively, are faithful mirrors of the idealistic trends of 4th-century art. On Spartan coins, while the reverse depicts the archaic statue of the Apollo of Amyklai, the obverse bears the head of a king with a diadem, probably Areus (310–266). In the rich series of coins from the Greek cities of the west, there is an even more pronounced conservatism (in typology, style, and technique). From Neapolis to Taras, from Metapontion to Thourioi, Kroton, and Lokroi hoi Epizephyrioi, from Syracuse to Carthage, the obverses of coins display very noble profile heads of divinities; the reverses are of comparable beauty. The coins produced in Syracuse between the reigns of Agathokles and Hieron II revived the type of Euainetos (5th-century coin designer), with Persephone on the obverse and a running quadriga on the reverse, or with another type of Persephone, her hair falling on her neck, on the obverse, and Nike with a trophy or running quadriga and the names of Agathokles and Hiketas, on the reverse. Coins from Metapontion of the last years of the 4th century show a fine head of Demeter or Persephone in a pure classical style on the obverse and a graceful ear of wheat on the reverse. Contemporary coins from Lokroi have, on the obverse, a magnificently modeled head of Zeus and, on the reverse, an eagle devouring a hare; this latter is one of the finest ensembles to adorn the reverse of a coin. The coins of Carthage imitate the Syracusan types with the head of Persephone or Arethousa, or they are modeled after the coins of Alexander with the youthful head of Herakles with a lionskin. Through the remainder of the 3d and the succeeding centuries the coinage of the cities slowly lost its splendor and seriously deteriorated in style or, because of political events, was suspended altogether. Sometimes the heads of divinities on the obverses reflect the influence of contemporary coin portraits. The classical ideals receded further and further, and Roman expansion gradually halted the fine coinage of Sicily and Magna Graecia.

About the end of the 3d century and the beginning of the 2d, Spanish cities issued coins with the head of Herakles-Melkarth with a diadem (obverse) and an African elephant (reverse). The campaign of Pyrrhus of Epirus in Italy (280–274) brought about the issue of a series of coins minted with his name in Sicily and Magna Graecia; they were of notable stylistic quality, showing, on the obverse, heads of Athena, Artemis, Zeus, and Persephone and, on the reverse, Nike advancing with a trophy, and Athena Promachos. In the 2d century the coins of Carthage repeated in stereotyped forms the type of Persephone which had become traditional in Syracusan coinage. After the period of Macedonian supremacy, Athens had established friendly relations with Rome and in 229 began new issues, elaborating its traditional types (obverse: head of Athena with a helmet; reverse: owl on a Panathenaic amphora within an olive wreath, the monograms or names of magistrates). These coins, which were not of great stylistic value, invaded the world market. The coinage of cistophori began about 200 B.C. (the *cista mystica* with a snake, obverse; a pair of coiled snakes, reverse). They were coined by many cities of Asia Minor (e.g., Ephesos, Pergamon, Smyrna, Sardis, Tralles, Laodikea), and were to become, especially after the creation of the province of Asia (133 B.C.), the coin type of western Asia Minor. Hellenistic coinage exerted a strong influence on that of republican Rome and that of barbarian peoples, especially the Celts.

GLASS, TEXTILES, RUGS. Two important branches of Hellenistic craft arts, glass and decorated fabrics, can be only mentioned here. They exercised wide influence and continued in subsequent periods. Glass techniques varied widely and included molded and decorated glass paste, gilded glass, fused glass paste in various decorative motifs (e.g., mosaic glass), painted glass, incised glass, glass relief imitating cameos, and blown glass. There are very beautiful examples of gilded glass, glass of *a mosaico* type, painted glass, and relief glass; included are gilded cups from Canosa (Br. Mus.) and from Syria (Paris, Rothschild Coll.); several splendid "millefiori" cups from Caucasia (in Leningrad); painted, or gilded and painted, glass in Locarno, Turin, Berlin, and Paris (Louvre); and cameo glass: blue glass from Pompeii (VI, PL. 219), and the Barberini (later Portland) Vase (Br. Mus.). The dates of these pieces range from the 2d century B.C. to the 1st century of our era. Decorated glass was employed for vases as well as for tesserae of varied sizes used in inlay adorning jewelry, furniture, and even ceilings and walls. The principal workshops were in the east and later spread to the west. Alexandrian factories, heirs of the old Pharaonic glass industry, were especially important.

Many written records attest to the magnificent Hellenistic production of rugs, tapestries, upholstery, cushions, clothing, and other decorated fabrics. There are contemporary reflections of decorated Hellenistic fabrics (woven, embroidered, or painted) in mosaics, paintings (beds and ceilings of Alexandrian necrop-

olises and of southern Russia), and sculpture (the veil of Despoina in the Damophon group); however, surviving examples are very rare. (There are fragments of about the 4th century from southern Russia, and some dating from before 2 B.C. from northern Mongolia.) On the other hand, a large number of fabrics of late antiquity still exist, particularly those from Egypt; they are sometimes very beautiful. Many repeat motifs and forms of the Hellenistic age (e.g., floral motifs, Erotes, Nereids, bucolic scenes, Nile motifs). There were several centers of production, but the Asiatic and especially the Egyptian manufactories remained important for many centuries.

**HELLENISTIC-ROMAN ART.** The sphere of Hellenistic art includes not only the work and direct influence of Greek artists in Italy and Rome from the 3d to the 1st century B.C., but also much of the artistic production of the Roman Empire and Rome itself. Even in the official art of Rome and in the art of the western Roman provinces, Hellenism, acting both as a stimulus and as a formal ideal, assumes a special aspect and function. It provides a continuous thread of Hellenistic tradition in a world which was spiritually, politically, and linguistically not Hellenistic but Roman. It is useful, therefore, to assemble and discuss separately the most important features of this phenomenon. See also AFRICAN-ROMAN ART; DANUBIAN-ROMAN ART; GALLO-ROMAN ART; HELLENISTIC ART; HISPANO-ROMAN ART; ROMAN IMPERIAL ART. For the eastern provinces, see ROMAN ART OF THE EASTERN EMPIRE.

SUMMARY. General considerations (col. 393). Architecture (col. 395). Sculpture (col. 402): *Mythological themes and Greek types; Portraiture; Narrative relief*. Painting (col. 408). Ceramics (col. 409). Glassware (col. 410). Metalwork (col. 410).

GENERAL CONSIDERATIONS. Excluding the contacts established through Campania and Etruria (see ETRUSCO-ITALIC ART), the first signs of a direct and significant Greek influence on the cultural life of Rome appear toward the end of the 4th and in the 3d centuries B.C. During the Samnite Wars, statues in honor of Alcibiades and Pythagoras were erected in the Comitium by order of the Delphic oracle (Pliny the Elder, *Naturalis historia*, xxxiv, 26). The first military triumph in which works of art were brought to Rome seems to have been that celebrated by M. Curius Dentatus in 275 B.C., after the victory over Pyrrhus (Florus, *Epitomes*, 13; cf. O. Vessberg, 1941, p. 21).

The traditional date for the arrival of Hellenistic culture in Rome is 212 B.C., when Syracuse was captured by M. Marcellus. He brought back to the capital numerous works of art which were placed in the temple he dedicated to Honos and Virtus near the Porta Capena. According to Livy (*Annales*, xxv, 40, 1–3), "Inde primum initium mirandi Graecarum artium opera . . . factum est" ("From that came the very beginning of enthusiasm for Greek works of art"). Another important event in this field was the capture of Tarentum (209 B.C.). In 194 B.C., after the defeat of Philip V of Macedonia, T. Quinctius Flamininus brought back a large number of Greek bronze and marble sculptures — the first we hear of the presence in Rome of works executed in marble (Livy, *op. cit.*, xxxiv, 52, 4–5). Of particular importance, too, were the Asian campaigns of L. Cornelius Scipio and C. Manlius Vulso, which came to a victorious conclusion in 186 B.C. It was probably Scipio who was responsible for the influx into Rome of many artists and craftsmen from Asia Minor and Syria (Livy, *op. cit.*, xxxix, 22, 9–10). At this time (Pliny, *op. cit.*, xxxiv, 34), *luxuria* made its first appearance in Rome, where, until then, the sacred images in the temples had normally been built of wood or clay. The introduction of the new forms of art aroused the opposition of a group of senators led by Cato the Censor (Livy, *op. cit.*, xxxix, 4, 4). Another decisive influence was exerted by the extensive relations with Pergamon, which became even closer when Attalus III died in 133 B.C., having made the Roman people the heirs to his kingdom. With the victories of Fulvius Nobilior (Livy, *op. cit.*, xxxix, 5, 13–16) and Aemilius Paulus in Greece, many other Greek works of art made their appearance in Rome; but it was above all L. Mummius, the Roman general responsible for the destruction of Corinth in 146 B.C., who filled Rome (Pliny, *op. cit.*, xxxiv, 36) and other Italian cities with masterpieces. This information is confirmed by the inscriptions placed on the statues forming part of Mummius's booty which have been found in Samnium, in the territory of the Sabines, in Parma, and even outside Italy (Vessberg, 1941, p. 33). In the 1st century B.C. the plundering of works of art following military operations was more limited, but the triumphs of Sulla, of the brothers Lucius and Marcus Licinius Lucullus, of Pompey, and of Caesar contributed in their turn to a further enrichment of the public and private art collections of Rome.

ARTISTS ACTIVE IN ROME AND IN ITALY DURING THE REPUBLICAN PERIOD. *a. Architects*: Hermodoros (Ἑρμόδωρος) of Salamis, active at Rome in the second half of the 2d cent. B.C.; worked on Temple of Mars, dedicated in 138, Temple of Jupiter, dedicated in 146, Temple of Juno Regina and portico (uncertain); to him is also attributed Navalia in the Campus Martius (*ThB*, s.v. Hermodoros; G. Pesce, *EI*, s.v. Ermodoro). – Batrachos and Sauras (βάτραχος, Σαύρας) of Laconia, 2d cent. B.C., recorded by Pliny as builders of the temples of Jupiter and Juno Regina, but probably they were only artists engaged on temple decorations; they appear to have executed representations of a frog and a lizard on the base of the temple columns. Vitruvius attributes the temples to Hermodoros of Salamis (H. Thiersch, *ThB*, s.v. Batrachos; G. Carrettoni, *EAA*, s.v. Batrachos). – Cyrus (Κῦρος), from southern Italy, active in the first half of the 1st cent. B.C.; worked in Cicero's villa at Arpinum, in 55 and 60; for Cicero's brother Quintus in 56; and may have been concerned with the planning of Caesar's Forum (Weickert, *ThB*, s.v. Kyros; J. M. C. Toynbee, *Some Notes on Artists in the Roman World*, Brussels, 1951, p. 10). – Chrysippus Vettius, freedman of Cyrus and continuer of his work in the Ciceronian villas (L. Guerrini, *EAA*, s.v.). – Aemilius Crescens, freedman, probably flourished in the last period of Pompeii, known from two wall inscriptions in the house Reg. VII, 4, 5, Pompeii (M. Della Corte, *Case e abitanti di Pompei*, Rome, 1954, p. 181 ff., n. 430 A; I. Calabi Limentani, *EAA*, s.v. Architectus). – Vettius, freeborn, known from an inscription found on the site of the ancient Grumentum in Lucania, where he is recorded as the architect of a portico, remains of which were discovered at the site (I. Calabi Limentani, *EAA*, s.v. Architectus). – Mucius, according to Vitruvius, built the Temple of Honos and Virtus on the slopes of the Capitoline hill in 101 B.C. (E. Fabricius, *RE*, s.v., n. 4). – Chiattus or Chiatius, known from the correspondence of Cicero as the designer of his daughter Tullia's funerary monument and perhaps also of a *fanum* (temple) (I. Calabi Limentani, *EAA*, s.v. Architectus). – Valerius, of Ostia, 1st cent. B.C., according to Pliny, decorated a theater for the games of Libo (Ziegler, *RE*, s.v., n. 281). – Hospes, slave of a certain Appia, active in Samnium in the time of Caesar, began construction connected with the *duoviri quinquennales* of Caiatia in Samnium (E. Fabricius, *RE*, s.v., n. 1). – Numisius, thought to have been active in Rome in the 1st cent. B.C. (E. Fabricius, *RE*, s.v., n. 1).

*b. Sculptors*: Kleomenes I (Κλεομένης), son of Apollodoros and probably father of Kleomenes II, was Athenian, active at the beginning of the 1st cent. B.C. His signature appears to have existed in the 16th cent. of our era on the base of the Medici Aphrodite (preserved in an impression), but the authorship of the statue is dubious. Attributed to Kleomenes are the lower part of a colossal statue of Antonius Musa from Piacenza and the signature (false) on the altar bearing the sacrifice of Iphigeneia at Florence (Lippold, *GP*, p. 381; G. A. Mansuelli, *JdI*, LVI, 1941, p. 151 ff.; G. Lippold, *RE*, sup. VIII, s.v. Kleomenes, 15a). – Kleomenes II (Κλεομένης), probably son of Kleomenes I, active ca. middle of the 1st cent. B.C., signed a statue of the Caesarian period (the *Germanicus* in the Louvre). Among his lost works may be attributed the Muses which, according to Pliny, formed part of the collection of Asinius Pollio (Lippold, *GP*, p. 381; G. Lippold, *RE*, sup. VIII, s.v. Kleomenes, 15 and 15a). – Arkesilaos (Ἀρκεσίλαος), of uncertain origin, who worked also in metal, was active in Rome toward the second half of the 1st cent. B.C., and died in 42. His lost works include a statue of Venus Genetrix, set up in 46, known through contemporary coins and reliefs. He is tentatively identified with a torso from the Palatine, now in the Mus. Naz., Rome; a statue of Felicitas, unfinished owing to his own death and that of Lucullus the Younger, who commissioned it; a group of centaurs bearing nymphs, acquired by Asinius Pollio; a group depicting lioness and *amores*, acquired by Varro; a crater for the Roman knight Octavius (W. Amelung, *ThB*, s.v. Arkesilaos II; Lippold, *GP*, p. 386; M. T. Amorelli, *EAA*, s.v. Arkesilaos II). – C. Avianus Evander, Athenian, active in Rome in the second half of the 1st cent. B.C., was a sculptor in bronze and marble and a worker in metal. Antony took him to Alexandria and then as a prisoner to Rome, where he was slave and freedman of Aemilius Avianus, and probably also an art dealer. His lost works include a restoration of the head of the Artemis of Timotheus; it is not clear whether he executed the two bacchantes and a Mars acquired by Cicero together with a *trapezophoros*, or whether the works thus described were paintings he obtained for Cicero. As a worker in metal he is recorded by Cicero for a *trapezophoros* and by Horace for a *catillum* (W. Amelung, *ThB*, s.v.; Lippold, *GP*, p. 381; L. Guerrini, *EAA*, s.v.). – Coponius, of unknown origin, active at Rome in the first half of the 1st cent. B.C., executed for Pompey the statues of Pompey's 14 conquered nations, which were displayed in or near the Theater of Pompey and perhaps in the Portico of Pompey (M. T. Amorelli, *EAA*, s.v.). – Ophelion (Ὠφελίων), son of Aristonidas,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

1st cent. B.C., was perhaps also a painter (Bieber, 1955). His signature appears on the reverse of a breastplate used as a support for the statue of Sextus Pompeius, from Monte Porzio Catone, near Tusculum, now in the Louvre (Bieber, *ThB*, s.v.; Lippold, *GP*, p. 383).

*c. Painters*: Pacuvius, the famous dramatist, 219–129 B.C., also painted a picture of which nothing is known beyond the fact that it was placed in the Temple of Hercules in the Forum Boarium (Pfuhl, II, 830; *ThB*, s.v.). – Theodotos (Θεόδοτος), active about 200 B.C. in Rome, where, according to Naevius in his *Tunicularia*, he painted with an ox's tail the dancing figures of the Lares on the Ara Compitale (Pfuhl, II, par. 987 and 994; G. Lippold, *RE*, s.v. Theodotos, 54). – Plautius Lykon (Λύκων), perhaps from Asia Minor, 2d cent. B.C., received Roman citizenship, changing his Greek name of Lykon for the Roman P. Plautius. According to Pliny, he decorated the Temple of Juno Regina at Ardea; according to some writers, he also painted the nude figures of Atalanta and Helen at Lanuvium (Pfuhl, II, par. 825; G. Lippold, *RE*, s.v. Plautius, n. 62). – Sopolis (Σώπολις), 1st cent. B.C., was mentioned by Pliny as one of the most famous portrait painters of his time. According to Cicero, he had a school of painting at Rome (Pfuhl, II, par. 918 ff.; *ThB*, s.v.). – Antiochus Gabinius (Ἀντίοχος Γαβίνιος), perhaps of Syrian origin, freedman of Gabinius, pupil of the portrait painter Sopolis, was active in the 1st cent. B.C. (L. Guerrini, *EAA*, s.v.). – Iaia (Ἰαία), or Laia(?), from Cyzicus, was active at Rome about the middle of the 1st cent. B.C. and, according to Pliny, executed mainly portraits of women (Pfuhl, II, pp. 631, 745, 825, 838, 839; G. Lippold, *RE*, s.v.). – Mallius Lucius, of Rome, 2d cent. B.C., mentioned in an anecdote of Macrobius, was perhaps author of the paintings for the triumph of L. Cornelius Scipio (Pfuhl, par. 910, p. 851; G. Lippold, *RE*, s.v. Mallius, 17). – Arellius, of Rome, active shortly before the time of Augustus, was noted for painting goddesses with the faces of the women he loved (M. Cagiano de Azevedo, *EAA*, s.v.).

*d. Gem engravers*: Herakleidas (Ἡρακλεῖδας), from Sicily or Magna Graecia, probably made the gold ring (signature uncertain; VI, PL. 254; from Capua, now in Mus. Naz., Naples); the bezel is engraved with the portrait of a Roman, ascribed by Furtwängler and Breglia to the 3d cent. B.C., by Pernice to the 2d cent., and by Becatti to the 1st cent. of our era (Furtwängler, *AG*, III, p. 163; Pernice, *ThB*, s.v.; G. Becatti, *Oreficerie antiche*, Rome, 1956, p. 116). – Agathopus (Ἀγάθοπος) was the engraver of a gem with the portrait of a man, preserved in the Mus. Naz., Florence, and dated 2d cent. B.C. (Pernice, *ThB*, s.v.).

*e. Other artists*: Apelles was a silversmith or dealer whose name was recorded in a graffito on four cups from Pompeii, House of Menander. Two were decorated with country scenes and two with the Labors of Hercules, datable between the 2d and 1st cent. B.C. (A. Maiuri, *La casa del Menandro e il suo tesoro di argenteria*, Rome, 1933, p. 308 ff.; J. M. C. Toynbee, *Some Notes on Artists in the Roman World*, Brussels, 1951, p. 52, n. 4). – D. Segulius Alexa, goldsmith and freedman who lived at the end of the republican period, was known from an inscription at Forum Novum in the Sabine territory (I. Calabi Limentani, *EAA*, I, s.v. Aurifex). – C. Carvilius, a freedman, was a worker in bronze whose name appears on a votive inscription of a college of the republican period at Rome (I. Calabi Limentani, *EAA*, s.v. Aerarius).

ARCHITECTURE. In the first half of the 2d century B.C. a series of monumental buildings began to appear in the city of Rome. Among these the most important were the basilicas erected in the forum. Even their name (βασιλική, royal hall) suggests their derivation from Greek architectural forms. The Basilica Aemilia dates from 179 B.C., and the Basilica Sempronia, which served as a model for the Basilica Julia, was built ten years later. The building material employed was tufa, of a harder and more compact quality than that of Grotta Oscura used in the 4th century; and use was also made of peperino, or *lapis Albanus*, from the area of present-day Marino. Because of its fine grain, peperino was probably more suitable for use in those parts of the structure intended for decoration; but since its appearance did not match the marble of the Greek temples which inspired these buildings, it was covered with stucco. White travertine, which would have provided a better substitute for marble until the exploitation of the marble quarries of Luni and Carrara, was brought into use — and even then to a very limited degree — only in the second half of the 2d century B.C. An example is the Milvian Bridge, built in 109. In the 1st century B.C., however, travertine was employed in a variety of buildings, including the Tabularium of 78 B.C., the tomb of Caecilia Metella, and the Theater of Marcellus. In general, it can be said that peperino is the characteristic stone of the 2d century B.C., and travertine that of the 1st century.

The first temples of marble — that is to say, of Greek marble — were constructed in the second half of the 2d century B.C. (Velleius Paterculus, *Historiae Romanae*, i, ii, 5), when Q. Caecilius Metellus, the conqueror of Macedonia, engaged a Greek architect, Hermodoros of Salamis, to build two temples in the Campus Martius in honor of Jupiter and Juno.

Pompeii, plan of basilica (*from NSc, 1951, p. 277, fig. 1*).

Pliny (*op. cit.*, xxxvi, 45) refers to the arrangement by Sulla for the transportation to Rome of marble capitals taken from the Temple of Zeus Olympeios in Athens for the subsequent reconstruction of the Temple of Jupiter Capitolinus. Pliny also relates (xxxvi, 49) that thresholds made of African marble in the house of M. Lepidus, consul in 78, caused Lepidus to be much censured. Similar criticism was made of Lucius Licinius Lucullus four years later, when he imported from Greece a black marble, to which he gave his name. The orator L. Licinius Crassus was called "the Palatine Venus" because his house contained columns of Hymettian marble, which were considered more suitable for a temple than for a private dwelling. On the introduction of Italian marble from Luni, Pliny (xxxvi, 48) relates that, according to Cornelius Nepos, the Roman knight Mamurra, Caesar's prefect in Gaul, was the first to place marble slabs over the walls of his house on the Caelian hill and also to erect columns of Carystus and Luni marble. This information refers to 50 B.C., and though one need not consider this date as precise for the first employment of Italian marble, one can deduce that no great use was made of it prior to the middle of the century. Only with the Augustan age was there any large-scale exploitation of the Luni quarries.

In the last two centuries B.C., there occurred a very important technical innovation — the employment in foundations and podia of a mixture of lime and small stones, called by Vitruvius (*De architectura*, ii, 4, 1) *caementicia structura* and generally known as *opus concretum*. This method of construction is used in the podium of the Temple of Concordia, which goes back to 120 B.C., but recent discoveries in Ostia, and the Portico of Octavia and Portico of Aemilia in Rome, show that it was already in use at the beginning of the 2d century B.C. (A. Boëthius, Palladio, N. S. VIII, 1958, p. 2 ff.). In the 1st century B.C., most of the great Hellenistic buildings of Rome and of Latium were built of this *opus concretum*, covered with a facing of tufa or other stone, and then of brick.

The few surviving temples of the last three centuries of the republican period in central Italy show that the Etrusco-Italic tradition was much influenced by Hellenistic taste, without, however, entirely losing its native characteristics. The four temples at Largo Argentina in Rome (FIG. 397) go back in their original form to the 3d century B.C., save for Temple C, which belongs to the 4th century. Temples A, C, and D stand on rectangular bases, while Temple B is circular, with a tetrastyle pronaos. In Temple C, the most interesting of the

four, entrance to the high podium is by a flight of steps at the front, and a colonnade runs the entire length of the flanks; while the back, in the traditional Italic manner, is without columns and is closed at the extremity of the podium by the prolongation of the rear wall of the cella. Temple A, in the first phase of its existence, was a relatively modest structure, on a high podium and probably *in antis* and Doric. In the 2d century the podium was raised, and the pronaos became tetrastyle and Ionic. In the 1st century B.C. the temple was completely rebuilt and transformed into a peripteral hexastyle

Rome, plan of temples in Largo Argentina. *Key*: (1) Walls of the republican period; (2) walls of the Imperial period. From right to left are temples A, B, C, D (*from G. Lugli, Monumenti antichi di Roma e suburbio, III, Rome, 1938*).

structure, the old podium remaining as the foundation of the cella, while outside, at about $6^1/_2$ ft. distance, a new podium, abutting the old one was constructed to support a Corinthian colonnade. Also characteristic of the final Hellenistic period in Rome were the three temples in the area of S. Nicola in Carcere, situated in the old Forum Holitorium. The southernmost temple was Doric and built of travertine; the northernmost, Ionic and built of peperino; the central one, also Ionic, was restored during the Empire and had marble columns resting on a podium of tufa faced with travertine. Of great interest are the vicissitudes and restorations undergone during the course of centuries by the Temple of Jupiter Capitolinus. The Etruscan temple, which remained standing until the fire of 83 B.C., underwent a series of modernizations in the 2d century B.C. In 179, columns and walls were restored; a few years later the floor was paved with mosaics, and in 172 the ceiling was gilded. In the Hellenistic temple of marble, rebuilt after the fire and decorated with Corinthian capitals taken from the Temple of Zeus Olympeios in Athens, the old base was preserved for constructional and religious reasons as the podium of the new building.

A comparison of the temple of Cori, the round temple of Tivoli (PL. 201), and the two temples in Piazza Bocca della Verità in Rome clearly reveals the progressive weakening of Italic characteristics and the triumph of Hellenistic taste. In the little Doric temple of Cori, which in all probability dates from the beginning of the 1st century B.C., the high Etrusco-Italic podium is preserved untouched. The temple is approached from the front by a flight of steps and has a deep pronaos and rather slender columns, with slight entasis and fluting of a kind very common in Italic Hellenism although not without Oriental prototypes — confined, that is to say, to the upper two-thirds of the shaft, the lower third being a polygon of 18 sides. The small round temple in Tivoli, which also has a high podium and a flight of steps giving access from the front only, is another example of the graceful style of temple building in the age of Sulla. The capitals, with their groupings of lush acanthus leaves and the large flowers adorning the abacus, are altogether Italic in type. The two temples in Piazza Bocca della Verità, however, show a closer adherence to Greek forms. The rectangular, pseudoperipteral Temple of Fortuna Virilis has, like the others described above, a high podium approached by steps from the front only, but the prolongation of the half columns of the cella along the rear side is indicative of a non-Italic influence. The small circular temple with its low podium surrounded by steps, and constructed throughout of Greek marble except for the tufa base, has no specifically Italic characteristics and would seem to date from the Augustan age.

Hellenistic influence is visible not only in the fields of architectural form and of building materials but also in that of fictile decoration, a characteristic feature of the local tradition (see ETRUSCO-ITALIC ART). Its presence can be seen in the composition and the figures of pediments, for example, at Falerii ("Scasato" temple), at Telamon, at Civitalba, and at Rome in the important group of Via S. Gregorio (PL. 202) depicting a sacrifice, a motif which was to become dominant in Roman iconography. The very short toga worn by a male figure suggests that the piece should be ascribed to a period a little before 100 B.C.; the figure of the seated goddess reveals stylistic affinities with the frieze of the Hekateion at Lagina (PL. 187), which belongs to the last decades of the 2d century B.C.

In the late republican period there is evidence in Latium of the spread of the Hellenistic taste for colossal buildings and complex theatrical effects. A striking example is provided by the Sanctuary of Fortuna Primigenia in Palestrina (PLS. 197–199; FIG. 399). This vast structure, conceived on a rigidly axial plan, comprises no less than seven terraces, the highest of which supports a semicircular atrium with double colonnade enclosing an auditorium, and a small round edifice where in all probability we should recognize the actual Temple of Fortuna itself. Another example of this combination of atrium and auditorium can be seen in Italic architecture of the final republican period, in the Temple of Venus Victrix over the auditorium of the Theater of Pompey in Rome. The Sanctuary of Fortuna Primigenia is built of *opus incertum*, that is, *opus concretum* faced with small stones of irregular shape but with fairly flat surfaces; the shafts of the columns are of tufa and travertine, the capitals and bases of travertine. This imposing architectural achievement, which probably belongs to the period of Sulla (though attempts have been made to date it at an earlier period, about the middle of the 2d century B.C.), has obvious precedents and models in the Hellenistic East; here there are many examples (such as the Acropolis of Pergamon or the Sanctuary of Asklepios on the island of Kos) of works of architecture designed for monumental effects through the interplay of terraces, colonnades, and courts surrounded by porticoes. But it has been rightly pointed out that Italic monumentality differs substantially from its Greek counterparts by virtue of its dynamic rhythm and highly developed and organized symmetry. In the Sanctuary of Hercules at Tivoli (FIG. 401), also built in terraces on the side of a hill, there is more emphasis on the sacred character of the edifice, a complete temple being placed at the center of the structure. The building adheres more closely to Hellenistic models, such as the Sanctuary of Asklepios of Kos, and is clearly later in date than the Sanctuary of Fortuna Primigenia, providing a link with the first monuments of the Empire, such as the Forum of Augustus. The Temple of Jupiter on the Acropolis of Terracina must have presented its architect with extremely severe topographical problems. Though stylistically related to the sanctuaries at Palestrina and Tivoli, this building, constructed during the Sullan period of *opus incertum*, lacks the artistic qualities of Palestrina and the monumentality of Tivoli.

Public and private buildings also were subject to a constant Eastern influence during the last two centuries B.C. We have already referred to the basilicas. Much the same can be said for the imperial forums, the prototype of which appears to have been Caesar's Forum (FIG. 402), begun in 54 B.C. and, as Appian says (*Bellum civile*, ii, 424), intended not for trade but for the transaction of public business, on the model of certain squares in Persia especially set aside for this purpose. Caesar's Forum, laid out on a strictly axial plan, contained a temple at one end of the square, constituting the focal point of a perspective created by the porticoes running along either side of the

square. This arrangement owes something to the old Etrusco-Italic model of the temple with its temenos (cf. also the forum at Pompeii), but the decisive influence in this and similar plans came from the Hellenistic agoras of the East. The most obvious parallels are in Asia Minor at Pergamon (FIG. 310), Priene (FIG. 311), and Miletos. Further, in the process of urban Hellenization at Rome in the last two centuries of the republic, a notable feature is provided by the numerous porticoes adorning the streets and the squares, and often embellishing the sumptuous villas of the wealthy, particularly those by the sea at Stabiae. (Such porticoes also constitute a characteristic element of landscape paintings containing views of maritime cities.) The adoption of Hellenistic canons in Caesar's Forum is demonstrated by the colonnaded porticoes of the Basilica Aemilia and of the Tabularium, a building constructed in 78 B.C. and designed for use as an archive; its two porticoed stories look down from the slopes of the Capitoline hill, completing the general architectural effect. The very idea of concentrating in a great central archive a number of small scattered archives is a cultural element of Hellenistic origin, though it also belongs to a process of specialization in the use of public buildings, bound up with the complexity of administering a vast empire.

The Theater of Pompey, the first permanent building of

Tivoli, plan of Sanctuary of Hercules; details uncertain, particularly for the central temple (*from L. Canina, Gli edifici di Roma antica, Rome, 1856, VI, pl. CXXVI*).

its kind constructed in Rome (55 B.C.), was, with its enormous portico and its temple, an example of Hellenistically inspired architecture and very close, from the architectural point of view, to the Sanctuary of Fortuna Primigenia at Palestrina and the sanctuary at Tivoli. One should, however, mention in this connection the temple-theater of Carthaginian-Roman origin discovered at Cagliari in Sardinia (P. Mingazzini, *Il santuario punico di Cagliari*, Studi Sardi, 10–11, 1952, pp. 156–168).

Earlier in date than the great markets built by Trajan on the slopes of the Quirinal are the small enclosed markets built at Tivoli and Ferentino toward the end of the republican period. The origin of this type of building is still not entirely clear, but the most acceptable theory seems to be that which ascribes it to Eastern influence, on the grounds of the great number of covered streets, bazaars, and khans which exist and have always existed in Near Eastern countries. It is perhaps significant that Apollodoros (q.v.), the architect of the Trajan markets, was a native of Damascus.

The influence of the Hellenistic East is also visible in the development of dwelling houses under the late republic (PL. 200; FIG. 402). In the Roman atrium, Hellenistic columns surround the impluvium, and the Greek house with its peristyle is incorporated into the traditional Italic house with atrium; however, in contrast to Eastern practice and in deference to a prin-

Rome, plan of Caesar's Forum: (*a*) Temple of Venus Genetrix; (*b*) Basilica Argentaria; (*c*) Clivus Argentarius; (*d*) tabernae (*from G. Lugli, Roma antica, il centro monumentale, Rome, 1946*).

ciple of rigid axiality, the peristyle is generally situated behind the tablinum. Archaeological sources and discoveries — for example, at Tyre and at Alexandria — prove that Roman city architecture of the late republican period derived some inspiration from the tall constructions of Hellenistic cities; nevertheless, the insulae and blocks of dwelling houses, known to us especially through the excavations at Ostia, underwent a vast, independent, and characteristically Roman development in the imperial period, with important consequences for the history of Western architecture.

SCULPTURE. *Mythological themes and Greek types.* The appearance of Hellenistic influences in temple decoration has already been mentioned. To the 2d century B.C. belongs an extremely interesting group of works carved in peperino, probably of Roman workmanship, many of them characterized by a lively pathos and reminiscent of contemporaneous works from Asia Minor, such as the frieze of the gigantomachy of Pergamon (PLS. 172, 173), which exerted a considerable influence upon the sculpture of central Italy. Typical of this group are the heads of a Gaul, of Minerva, and of Apollo in the Museo Nuovo dei Conservatori at Rome (D. Mustilli, *Il Museo Mussolini*, Rome, 1938, pls. III, IV, V), originally probably covered with stucco or painted. They can be compared with the fictile heads from Arezzo belonging to temple friezes (Andrén, 1940, pl. 90, nos. 322–24; also the two heads on pl. 89, nos. 318 and 319, which for reasons of style and age must belong to the same group, though hitherto attributed to an earlier period). The 1st century B.C. is dominated by the activity of copyists belonging to the school of Pasiteles and by the new production of the classicistic movement (see ANTIQUE REVIVAL; CLASSICISM; NEO-ATTIC STYLES). While the main source of inspiration of these tendencies is Athens, another current of influence derives from Asia Minor and from Rhodes. The Pudicitia type, so common in funerary statues and reliefs, is of a classicistic style which reached Roman sculpture from Asia Minor; numerous Hellenistic sculptures were brought to Rome in this period. Among these we should mention the group

Pompeii, plan of House of the Faun: (*a*) Taberna; (*b*) cubiculum; (*c*) ala; (*d*) atrium; (*e*) triclinium; (*f*) tablinum; (*g*) peristyle; (*h*) bath; (*i*) kitchen; (*j*) exedra; (*k*) posticum (*from D. S. Robertson, A Handbook of Greek and Roman Architecture, Cambridge, Eng., 1929*).

representing the punishment of Dirke, by Apollonios and Tauriskos of Tralles, a copy of which is now in the Museo Nazionale, Naples (the Farnese *Bull*), and had been in the collection of works of art formed by C. Asinius Pollio (probably in 30 B.C.), and the *Laocoön*, by Hagesandros, Polydoros, and Athenodoros of Rhodes (PL. 189). However, it should be noted that Hellenistic originals did not arouse the same interest among copyists as did the works of the classical period.

*Portraiture.* It is above all in portrait sculpture that the contribution of Hellenism to Roman art is most clearly visible. Recent studies have shown that the portrait bust or statue of the late republican period was not, as had previously been believed, the result of a purely Roman or Italic process of evolution. The Romans' habit, referred to by Polybius (*Histories*, vi, 53), of preserving in a cupboard (*armarium*) in the atrium of their houses the masks of their ancestors, which were carried in procession during important funerary ceremonies, undoubtedly stimulated interest in portrait sculpture; but it did not of itself lead to the creation of an independent form of art. Neither in Rome nor in any other part of Italy are there traces of an autochthonous and genuine tradition of portraiture. From historical sources we know that in the late 4th and in the 3d centuries B.C., statues in honor of famous men, living and dead, began to appear in Rome; but it is unlikely that either this custom or the statues themselves had a genuinely Roman character, the origin of this practice being traceable to a similar use prevailing in 4th-century Greece. In this connection, much significance attaches to Pliny's information, already mentioned, concerning the erection in the Comitium of statues of Pythagoras and Alcibiades, undoubtedly of Greek influence, probably even imported. No Roman portrait belonging to the years 350–200 B.C. has come down to us, so that to form an idea of Roman portraiture of this period we must turn to Etruria. Etruscan portraits which precede or coincide with the advent of Hellenism show little or no tendency toward the individualization of physical features but, on the contrary, display an inclination toward idealization, which is certainly derived from Greek art. As examples one might cite the sarcophagus of Cerveteri (Rome, Mus. Vat.) and the portrait of Arnth Paipnas from Tarquinia (G. Q. Giglioli, *L'arte etrusca*, Milan, 1935, pl. CCLVI, 1–2), which represent the Italic version of the Greek ideal portrait. Works such as the statue of Sophocles in the Lateran and 4th-century Attic funerary steles are the sources from which the first Italic portrait sculptors drew their inspiration; but between the latter and Roman portraiture there is no continuity, the art of the Roman portraitists deriving from the great centers of Hellenistic art via the large-scale importation of works of art and of artists in the last two centuries B.C.

In central Italy (Etruria and Latium), portraiture in the final period of Hellenism, particularly in the 2d century B.C., was dominated by a simplified and often very expressive taste. As an example we might mention the figure on a sarcophagus in the Museo Nazionale, Tarquinia (Vessberg, 1941, pl. XX, 8); the features are rendered in a vigorous but summary fashion, while, to intensify the expression, some elements are deformed in an unnatural way, the eye sockets being excessively emphasized and eyes, mouth, and chin depicted in abnormal size. The same expressionistic style, simplified but vigorous, can be seen in the figures on Roman 2d-century coins, particularly in the treatment of the head of Roma. This crude but intense expressionism in various branches of 2d-century Italic art is undoubtedly a local phenomenon, but it probably found a source of inspiration in the baroque of Pergamon, though reelaborated in the Italic manner. The influence of Pergamon can be seen in some Roman portrait coins, such as those of T. Quinctius Flamininus (PL. 209) and of the elder Scipio Africanus. The former is depicted in the almost romantic aspect of poet and philosopher, reminiscent of the so-called "pseudo-Seneca" (PL. 170), on a gold coin minted in Greece at the beginning of the 2d century B.C. Stylistically, both coin and portrait are Greek and closely resemble portraits appearing on Macedonian coins of the first decades of the 2d century. Scipio is depicted on a Roman denarius coined about 91 B.C.; the helmet, the face, and the upturned gaze all suggest the portrait of a Greek strategos carried out in conformity with the baroque taste of Pergamon.

In the middle of the 2d century, this dramatic tension seems to have slackened, as can be seen in the Pergamene frieze of Telephos (PL. 174), which is serene in comparison with the gigantomachy, as well as in Hellenistic portraiture of this period, which displays a less emotional realism. Among portraits on coins we should mention those of Demetrios I of Syria (162–150 B.C.; F. Imhoof-Blumer, *Porträtköpfe auf antiken Münzen hellenischer und hellenisierten Völker*, Leipzig, 1885, pl. III, 23), Alexander I Balas of Syria (150–145 B.C.; Imhoof-Blumer, pl. III, 24), Orophernes of Cappadocia (158–157 B.C.; Imhoof-Blumer, pl. V, 21), and Ptolemy VI Philometor of Egypt (181–145 B.C.; Imhoof-Blumer, pl. VII, 13). This 2d-century Hellenistic realism in Italic territory offers some outstanding examples, such as the so-called "Hellenistic ruler" (Mus. Naz., Rome; PL. 185) and the so-called "Orator," or "Arringatore" (V, PL. 53; Mus. Arch., Florence) both in bronze. Although the first of these was found in Rome, there are no grounds for attributing it to a Roman artist: it was imported or was executed by an immigrant artist from the east. The face shows a curious mixture of realistic and baroque elements, and the statue constitutes an interesting example of that Hellenistic sculpture which took root in Rome at the time of the Scipios, encountering the keen disapproval of the elder Cato. The "Orator," found near Lake Trasimeno, and dating from the end of the 2d century, has the sober qualities of Hellenistic portraiture, and in the simple and realistic characterization of its provincial subject — probably an official of some minor Etruscan city — it anticipates the bourgeois Roman realism of the 1st century B.C. It is in the age of Sulla and Caesar, a period of cultural as well as of political formation, that one must place the beginnings of Roman portraiture, which was an art created by immigrant Hellenistic artists and was from the outset cultivated by a local Roman school of decided Hellenistic leanings. The number of portrait statues erected in this period was extremely large; the subjects were not confined to important figures like Sulla and Caesar but included much more humble citizens. In 85 or 84 B.C., according to Pliny (*op. cit.*, xxxiv, 27), statues were set up at Rome *in omnibus vicis* to the praetor Marius Gratidianus (who had played a part in the introduction of a monetary reform) and on the Capitoline and the Palatine hills to M. Seius, aedile in 74 (who had distributed cheap corn to the people). Cicero's speech against Verres reveals the tremendous number of portrait statues, mostly of gilded bronze, which existed in the public places in Rome and in the cities of Sicily.

The painters, sculptors, and gem engravers who descended in hordes on Rome from Athens, Alexandria, and the artistically rich cities of Asia Minor quickly adapted themselves to the tastes of their new patrons, while arousing in the Romans a profound interest in their own art. In the course of a generation, between the dictatorship of Sulla and that of Caesar, these foreign artists created Roman portraiture, influenced by all that their adopted country had to offer; the portraiture of the final republican period was thus the result of a process of fusion, out of which there emerged as a dominating trend that Hellenistic realism represented by 2d-century portrait coins and by the "Orator." There are, however, several imponderables in the development of Roman (or Italic) art history. The new atmosphere into which the artists were plunged influenced them socially, through the taste and demands of their patrons and the social function of portraiture at Rome (cf. the ancestral masks), and artistically, through the ancient art of central Italy, with its skill in catching the essential characteristics of the individual human face. The preference shown for the sober rather than the emotional aspect of Hellenistic portraiture — represented, for example, by the portrait of Attalos — was probably due more than anything else to the taste of the times and to the spiritual atmosphere of Rome during the bitter struggles of the civil wars.

At the beginning of the 1st century B.C., Roman portrait sculpture presents, as one might expect, a mixture of styles

and tendencies producing three main currents; one can apply to these currents the conventional classifications of pathetic, realistic, and classicistic. The first of these, the pathetic, was prominent in the first half of the 1st century B.C. and includes some brilliantly executed portraits, idealistic and at the same time pathetic in nature, following the Hellenistic trend represented by the portrait of Attalos. This trend, from its source of inspiration, Pergamene baroque, can be called a postbaroque style. As surviving works which can be dated with any degree of certainty are very rare, the best source for our knowledge of the portraiture of this century is offered by portrait coins. In this group can be included the portraits of Sulla and Pompeius Rufus found on coins struck about 57 B.C.; the portraits of A. Postumius Albinus, consul in 99, on coins of 49–48 (Vessberg, 1941, p. 132 ff.); and those of Pompey on denarii minted in Spain by his son in 46–45 (Vessberg, 1941, p. 135 ff.). Around these portrait coins, all based on portraits belonging to the first half of the century, can be grouped several works of sculpture which for stylistic reasons can be assigned to the first half or the middle of the century. Among the most typical of these sculptural works are the heroic portrait statue from Tivoli at the Museo Nazionale, Rome (PL. 205; Vessberg, 1941, pls. XLVIII, XLIX); a portrait of which there are copies in the Museo Nazionale, Naples, and the Louvre (Vessberg, 1941, pl. L, 1–3); a head at the Lateran Museum, Rome (PL. 206; A. Giuliano, *Cat. dei ritratti romani del Museo Profano Lateranense*, Vatican City, 1957, no. 6, pls. 5–6); a portrait, perhaps of Sulla, in the Vatican Museums (Chiaramonti); the portraits of Cicero; and a portrait of an old man with a lively and intelligent face, of which there are copies in the Vatican Museums (Braccio Nuovo), the Louvre, and elsewhere. This last portrait probably depicts a famous personage (Vessberg, 1941, pl. LVI), but, like so many other portraits of this period which exist in several copies, it still eludes every attempt at identification. Closely related to it is a portrait existing in two copies in the Lateran Museum (Giuliano, *op. cit.*, ns. 4–5, pls. 3–4). The link between the members of this group, whose number could easily be increased, is more interior than exterior in that, beyond their physical appearance — undoubtedly a faithful representation of reality — they also reflect a spiritual attitude and content. Unlike works of the Imperial period, these statues are extremely difficult to date precisely, but it is safe to say that the heroic portrait statue in the Museo Nazionale (PL. 205), the chronology of which is much discussed, is in its spirit completely a work of this period. Many details, such as the segmentation technique in the treatment of the head and the Hellenistic design of the cuirass utilized as a support, speak in favor of an early date. It should also be noted that the statue was found in the substructure of the temple at Tivoli, which goes back to the period of Sulla (*NSc*, 1925, p. 252 ff.). Equally important is the dramatic expression of the face, which is clearly connected with the baroque of Pergamon and Rhodes, so that the work finds its natural place in the first half of the century; it would seem an anomaly to place it in a subsequent epoch, when the atmosphere was very different.

It is not this current, however, which predominates in 1st-century portraiture, but that which we have called realistic. This, too, is exemplified in a group of portrait coins dating from the end of the republic, characterized by an adherence to reality, without any tendency toward idealization. Among such portraits are those of Caelius Caldus on coins of about 61 B.C., of Antius Restio on coins of about 46 B.C., of A. Postumius Albinus on those of 49–48 (PL. 209; Vessberg, 1941, p. 132 ff.), and the majority of the Caesarian portrait coins (group A, Vessberg, 1941, p. 139 ff.). This current had particular links with Rome, a fact which emerges clearly from an examination of the most numerous and ancient class of Roman sculptural material, the funerary reliefs of the late republican period. Here there is an obvious development from a moderate realism (still attached to certain often-recurring and little-changing types) to an accentuated individualism full of exaggeratedly realistic details and with a predilection for the ugly, lined faces of old age. This development can be illustrated with reference to specific examples. Among the most ancient and historically interesting of these reliefs is that of Aurelius Hermia (London, Br. Mus.; Vessberg, 1941, pl. XXIV, 2), the inscription of which reveals it as a work of the first half of the century. The figure of the man is clearly reminiscent of the realism of the 2d century B.C. and has an obvious parallel in the "Orator." It is not without interest that this figure also has links with the Hellenism of the final Etruscan period, as is clear from a comparison with the sarcophagus of Hasti Afuna in the Casuccini Collection of the Museo Nazionale, Palermo (Giglioli, *op. cit.*, pl. 412, 2; Vessberg, 1941, pl. XXIV, 1). In the relief of Blaesius and Blaesia at the Museo dei Conservatori, Rome (PL. 209; Mustilli, *op. cit.*, p. 176, no. 60; Vessberg, 1941, p. 83 ff.), certainly the oldest example of a funerary relief with busts of the late republican period, the busts depict conventional types of sepulchral and votive sculpture. That of the woman, in particular, has certain affinities with similar works produced both in Greece (Athens) and in Asia Minor. The half statue or the funerary bust was, in fact, a very common type in the last period of Hellenistic art, and it was from this source that it passed into Roman funerary sculpture. Later Roman portraits on funerary reliefs present a more accentuated and individual realism than that found in the works mentioned above, in which the types are still conventional. A problem which is still unsolved is whether the type of funerary relief with bust and protruding cornice is an Italian creation or is derived from the East. Reliefs of this type have been found in Asia Minor, but none have been found that can be dated with confidence to a period before the Roman examples. It is an interesting fact, however, that the use of these reliefs in Rome was popularized by foreigners, as can be deduced from the Greek names of the persons they commemorate, among which we frequently find the names Asia and Athena.

Examples of this realistic trend can be found all over Italy. In Tuscany there are some excellent portraits of the late republican and early Imperial periods, for example, a head in Perugia (Vessberg, 1941, pl. LXII), several figures from the covers of cinerary urns in Volterra (the famous terra-cotta group of husband and wife from Volterra certainly belongs to the last century B.C.), and a group of portrait statues from Chiusi (Vessberg, 1941, pl. LXXXV). Good portraits are also to be found on the other side of the Apennines, such as a head from Ancona (Vessberg, 1941, pl. LXXXIV). These last portraits, however, along with some of the portrait coins of Caesar, illustrate the increasing barrenness of republican portraiture.

Parallel to these realistic Roman portraits are certain Greek works, such as a bronze head in Copenhagen (PL. 209; Vessberg, 1941, p. XLVI, 3), a head in Delos (Vessberg, 1941, pl. XLVI, 4), and two heads in the National Museum, Athens (Vessberg, 1941, pl. XLVII, 1–2, 3–4). A comparison between one of these latter heads (Vessberg, 1941, 3–4) and the male figure in the Villa Celimontana relief illustrates with great clarity the links between Hellenistic art and the urban school of Rome. In this regard, other Athenian works can be cited, such as a head in Copenhagen, whose features, even in the surface treatment, realistically portray old age (Buschor, 1949, fig. 43), and a head from the Agora, more solid in structure (Hesperia, IV, 1935, p. 405 ff.; Buschor, fig. 44). Realistic portraits are also to be found in the eastern Mediterranean area, in Egypt and Cyprus, for example. A good example of Egyptian art is the beautiful "Stroganoff head" in the Metropolitan Museum, which has many affinities with the realistic portraits of Caesar; but with regard to the numerous portraits discovered in Egypt, the problem remains of determining whether they are earlier or later than their Roman parallels. Quite a few so-called "Roman" portraits have also been discovered in Cyprus, which, throughout the Hellenistic period, had strong links with the Egypt of the Ptolemies. Some of these portraits are of a high standard, such as a head in the Metropolitan Museum and another in Nicosia (cf. Swedish Cyprus Expedition, IV, 3, pl. XIV), and their existence shows to what extent the taste for realistic portraiture was international in its appeal. It is highly unlikely that these Cypriote portraits were the work of Roman or Italian artists; the fact that they are of limestone rules out the possibility of their being imported. All this sup-

ports the theory that Roman portraiture received much stimulus from Egypt. The profound influence exercised by Egypt on Roman culture and art during the period of Caesar and Augustus is well known; and it seems evident that the Roman realistic portrait was inspired by Alexandria and incorporated the ancient and still active tradition of the Egyptian realistic portrait.

The pathetic and idealizing current of the 1st century B.C. reappears occasionally in Imperial times, always clearly under the direct influence of the East, where this tradition was more tenaciously preserved. The magnificent portrait of Trajan in the attic of the arch in Benevento, on the side away from the town, is a figure full of imaginative power and dramatic force and is totally different from the conventional type of the official imperial portrait; the Trajan must have been executed by an Eastern artist during the last years of the Emperor's life in the East. We should also bear in mind the Hellenistic renaissance of the period of Gallienus, which finds expression in the romantic pathos of his portraits and which certainly resulted from a renewal of contacts with Greece. The realistic current, on the other hand, continued to exist uninterruptedly during the Claudian era side by side with the classicistic movement and came to the fore again in portraits of the Flavian period; during the Flavian period, however, realism had a distinct impressionistic flavor, full of illusionistic effects. In portraits of the era of Trajan there was a more obvious return to the portraiture of the late republican period.

*Narrative relief.* The forerunners of the Roman narrative relief are the paintings executed on the occasion of the celebration of triumphs (see ROMAN IMPERIAL ART). Many compositional elements of Roman narrative relief can be recognized in the reliefs on Etruscan urns and sarcophagi, which often drew their inspiration from the narrative art of Hellenism (see ETRUSCO-ITALIC ART). The real Roman tradition begins with the so-called "altar of Cn. Domitius Ahenobarbus"; the altar relief in the Louvre has been linked by Furtwängler to the relief in the Staatliche Antikensammlungen at Munich; the former depicts the wedding retinue of Poseidon and Amphitrite (PL. 210). Furtwängler was also the first to advance the theory — not very plausible despite some elements in its favor — that the two reliefs decorated the sides of an altar in the Temple of Neptune, built by Cn. Domitius in the Circus Flaminius. While the Munich frieze is almost Neo-Attic in taste, the Paris example belongs to the genre of historical narrative. The scene appears to represent the lustrum celebrated at the end of a census with the sacrifice of the suovetaurilia, offered by the censor to Mars. In contrast to the symmetrical, decorative groupings of the Munich frieze, here we have a variety of figures, soldiers, flautists, scribes, and others, who bestow on the scene a vividly narrative character full of the imprint of Roman life and outside the terms of a real artistic convention, which did not yet exist for such subjects. The chronology of the reliefs has been the subject of much discussion, and the dates suggested vary between 100 and 30 B.C. Obviously the question cannot finally be decided on historical grounds alone, for the connections of the frieze with Cn. Domitius are uncertain; but valuable assistance in determining its date is provided by its style. The heads of the Paris frieze show a marked affinity with Etruscan funerary sculpture of the final period of Hellenism: they have the same heavy, structureless faces characterized by a certain pathos which we find in the figures of the dead on many Etruscan urns (Giglioli, *op. cit.*, pls. CCCXCVI, 2; CCCCIII, 1; CCCCV, 4). Stylistic and antiquarian considerations suggest that the altar should be dated in the first half, perhaps even in the first quarter, of the 1st century B.C.

Traces of this narrative art can also be found on coins, such as those of about 59 B.C. showing the consul L. Junius Brutus walking between the lictors (H. Grueber, *Coins of the Roman Republic in the British Museum*, London, 1910, III, pl. XLVIII, 8), or on money of about 40 B.C. showing a lively scene of a warrior attacking a fortification defended by soldiers (Grueber, *op. cit.*, III, pl. LVI, 1).

In the history of the Roman historical relief, the second place in order of time is held by the Ara Pacis Augustae, the reliefs of which (PL. 211; III, PL. 488) already display the influence of classical taste. Here the historically authentic scene of the cortège of dedication, with members of the family of Augustus (PL. 261), alternates with mythological subjects. These reliefs represent for us the point of departure and, as it were, the model for the entire series of reliefs which were to adorn the great public monuments of the Imperial period. The great Cancelleria friezes (PL. 261), the reliefs on the Arch of Trajan in Benevento (X, PL. 154), and those on the Arch of Titus (though to a lesser degree because of their pictorial, realistic qualities) seem to live in the same atmosphere. Only in the Forum of Trajan in Rome, which has definite architectural connections with the Hellenistic East, does the Hellenistic current reappear — notably in the column (PL. 263; III, PL. 329; I, PL. 324) on whose spiral frieze, winding like a ribbon from the bottom to the top of the column, are depicted Trajan's two campaigns against the Dacians; the campaigns are shown much as they are described in the pages of Dio Cassius. Yet this column also shows certain developments from the Hellenistic-Roman narrative art of the late republican period. These developments, taken in conjunction with the sculptures on the column of Marcus Aurelius (PL. 264), betoken the first signs of a decisive break in the classical tradition and of the advent of late antiquity. Elements from the classicistic current and from Hellenistic narrative art are now fused in the renaissance of Greek-inspired art visible in the monumental reliefs of the period of Hadrian (PL. 212) and of Antoninus Pius.

PAINTING. Hellenistic painting in Italy survives only in wall paintings, mainly in Pompeii (PLS. 203, 204), Herculaneum (PL. 214), and Stabiae. Some examples have also been found in Rome, though here this art was introduced at a later date. It was August Mau, in 1882, who first proposed the now classic division of Pompeian wall painting into a series of stylistic periods, encompassing the years from 100 B.C. to the destruction of the city in A.D. 79. Style I, with its characteristic incrustations, is known to us from houses in Priene and Delos and from tombs in Alexandria and south Russia. The walls, covered with stucco and divided into rectangular sections, were painted to resemble various types of marble as a cheap substitute for the splendid marble decorations of the Hellenistic palaces of the East. Examples can be found in the House of the Faun in Pompeii (PL. 200) and in the Samnite house in Herculaneum. In Style II, wall decoration was dominated by the rich columnar architecture of late Hellenism. The wall, with its row of painted columns rising from a dado, seems to retreat into the distance, while the background is often enlivened by a cheerful prospect of colonnades and temples. In its earliest phases, this style had a distinctly architectural character. As an example we may mention the House of the Griffins on the Palatine in Rome, dating from about 50 B.C. or a little earlier. The style, however, is considerably older than that, as we find it displayed in the covered theater of Pompeii, which dates from a little after 80 B.C. The House of the Labyrinth and the Villa of the Mysteries (PL. 203) in Pompeii, the Villa of Boscoreale near Pompeii (PL. 192), and the House of Livia and the House of the Farnesina (PL. 207) in Rome all belong to the later phases of this style, when pictures containing mythological figures or real landscapes (as described by Vitruvius, *op. cit.*, vii, 5) were inserted between the columns. Even the mythological or other scenes often have connections with Hellenistic models, sometimes with models belonging to the first period of Hellenism. This is the case, for example, with the paintings in the Villa of the Mysteries and in the Villa of Boscoreale, while in the House of the Farnesina, Hellenistic motifs mingle with others of Neo-Attic inspiration. The Seleukos who signed his name on a painting in the Farnesina house appears to have been a Syrian artist, and, in fact, Style II gives the impression of having been created primarily in Asia Minor and Syria. In Style III the functional character of the various architectural elements disappears; columns, architraves, and other architectural devices become mere decorative framework. The content and style of the figure friezes and the ornamental motifs employed during the early years of the Empire show clearly an

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

Egyptian influence. The tranquil and limpid decorative sense dictating the division of the wall surfaces is in sharp contrast to that tendency to enlarge the confines of the room which more and more characterized the wall decorations of Style II and which reached its peak in Style IV (PL. 214), with its exuberance of fantastic and even theatrical architectural forms, obviously inspired by the art of stage decoration. The dominant nonfunctionalism of interior decoration in the first century of the Empire, both in Style III and in the architectural fantasies of Style II extremes, produced in Vitruvius (*loc. cit.*) a strong reaction: "Quemadmodum enim potest calamus vere sustinere tectum aut candelabrum ornamenta fastigi?" ("How is it possible for a reed to support a roof, or a candelabrum to bear the ornaments on the gable?") Style IV seems to have reached its peak in the Golden House of Nero (PL. 215).

This pictorial material, of which we have given a brief stylistic classification, is all that remains of Greek painting of the late classical and Hellenistic period: the originals on which these Roman works were based have disappeared. The quality of the copies is not always constant, and the faithfulness to their models varies considerably. Styles II and III are marked by an eclectic tendency and draw their inspiration from works of the late classical and Hellenistic periods. In Style IV Hellenistic models seem to predominate, and there are several examples of the use of a technique which today we should call "impressionistic"; it was derived from Hellenism, though certainly it was much perfected on Roman soil. Hellenistic in inspiration, too, are the idyllic mythological motifs, among the most popular of which were the series of myths concerning Dionysos, Aphrodite, and Eros. Also popular were dramatic myths like the punishment of Dirke, in the House of the Vettii (Pompeii), which derives from the same Rhodian archetype as the Farnese *Bull*. Also of Hellenistic inspiration are those caricatures, still-life paintings, and landscapes (PL. 213) which found expression in contemporary literature and in reliefs and which enjoyed special favor among the Romans, with their love of nature and country life. Among the names of Roman artists which have come down to us, one of the foremost is that of the landscape painter Studius, or Ludius, who, according to Pliny (*op. cit.*, xxxiv, 116), created in the Augustan age a new type of wall decoration showing villas, harbors, gardens, groves, woods, hills, rivers, and shores; the landscapes were peopled with figures on foot or on horseback. Pliny's description corresponds exactly to numerous wall pictures dating from the beginning of the Imperial period, such as those in the House of the Farnesina (PL. 207) and the frieze depicting a garden in the Villa of Livia at Prima Porta (PL. 208), which may actually be by Studius (see HELLENISTIC ART).

CERAMICS. In the minor arts, particularly in ceramics and glassware (PL. 216), we can clearly trace the influence exercised upon Rome by the Hellenistic East. Very common in the last Hellenistic period is a type of pottery found in great abundance in Asia Minor, Greece, the Aegean Islands, Syria, Palestine, Egypt, and North Africa, and known as "Pergamene." The term is slightly inaccurate, since Pergamon was not the only place of manufacture of this pottery; rather the city was one of the principal centers of production, and its workshops were still famous in Pliny's day. Pergamene pottery, which had its period of greatest splendor between 150 and 50 B.C., was usually fired at a relatively high temperature and was covered with a dark red glaze. The pottery normally took the form of large plates, cups, and bowls. Decoration, where it existed, was most often in appliqué relief obtained from molds and attached to the body of the vase; sometimes the decoration was impressed. Another type of pottery widely diffused in the last period of Hellenism is known as "Megarian" ware, mainly cups or bowls (PL. 194), first found at Megara and subsequently discovered in many other places. This pottery was made from molds and decorated externally in relief, sometimes through a stamping process, with leaf patterns and occasionally with figural scenes. Early examples of this ware have a black surface, but in the 2d and 1st centuries B.C. they are red in color. Pergamene and Megarian pottery types (see HELLENISTIC ART) are the forerunners of the red-glazed Roman Arretine pottery, the manufacture of which at Arezzo achieved its finest period between about 30 B.C. and A.D. 50. Arretine ware (PL. 216) is undoubtedly the result of a craft introduced by potters who went to Italy as a result of Roman campaigns in the East. Without passing through any experimental phases, it makes its first sudden appearance as an already fully developed product. It is significant that the oldest and most refined pieces come from the workshop of Marcus Perennius, whose first collaborator was a freedman named Tigranus, undoubtedly of Eastern origin, who had perhaps brought with him a group of potters from Asia Minor and Syria. The simpler pieces have the name of the maker impressed on the base, while pieces of higher quality have a decoration in relief produced by molding the ware in hemispherical forms, in the interior of which the design had been impressed by means of stamps. In the Roman provinces, especially in Gaul and in the Rhineland, this ware has been discovered in vast quantities and had a long and flourishing history (see GALLO-ROMAN ART).

GLASSWARE. The art of glass blowing, which probably originated in Phoenicia in the 1st century B.C. (Pliny, *op. cit.*, xxxvi, 190–91), soon spread to Rome. Strabo (*Geography*, xvi, 2, 25) relates that in Rome the manufacture of glass reached such a state of technical proficiency that glass bowls could be bought very cheaply. This indicates a mass production of glass, brought about by the use of glass blowing. The common type of glass in the Hellenistic period was made by molding or fusing the liquid glass over a sand core. This technique had little importance in Italy, but after the invention of glass blowing, an Italian national industry quickly developed, taking its inspiration from Syrian and Phoenician models. Pliny speaks of a glassworks in Campania beside the river Volturno; perhaps this was the source of much of the glass, some of it fused in molds and decorative in character, but most of it designed for domestic use, which has been found in large quantities at Pompeii and Herculaneum. Glass of high quality was imported on a large scale, principally from the coast of Syria (Sidon), but also from Egypt; in addition, glass blowers like Ennion emigrated from Syria and settled in Italy. It is scarcely possible that glass was as common in the Augustan age as Strabo would have us believe; nevertheless, it is to this period that we must trace the origin of the long and artistically important development undergone in the following centuries by the art of glassmaking. The manufacture of glass spread to northern Italy and Gaul, and in the 2d century of our era to the Rhineland and Belgian Gaul. The use of glass for domestic purposes was widespread and attained its peak of quality during the age of the Antonines and the dynasty of the Severi.

METALWORK. The use of vessels made of metal, particularly precious metal such as silver, was widespread in the area affected by Hellenistic-Roman culture; but their production remained the prerogative of the more Hellenized provinces within the Roman Empire rather than of the capital itself. The capital constituted a commercial area which absorbed rather than produced such works, even though some craftsmen came to Rome from the Hellenistic East in order to carry on their trade. Some Italian cities such as Tarentum were centers of metalwork, mainly specializing in copies of Greek originals that were usually made from plaster casts. But the supremacy of Alexandria was never challenged in this field, nor, later, was that of Magna Graecia, the Levant, or Asia Minor. The treasures of Hildesheim, of the House of Menander (PLS. 195, 216), of Boscoreale (PL. 216), and of Berthouville all bear witness to the great popularity, in certain Roman circles, of the products of that elegant and refined craftsmanship which looked to Alexandria as its source and inspiration (see HELLENISTIC ART). No real evidence exists that there ever was an autonomous Italic production of these objects; on the contrary, literary sources, though containing some indications of the use of other metals and imitations in pottery — undoubtedly Italic because clearly attributable to factories producing ware of Arretine type — bear witness to the foreign origin of fine household vessels of metal.

The information that we possess about some of the Roman collectors shows that there was an eager interest in the acquisition of metal vessels of high artistic standard, even if the caliber of the collectors was unequal to that of the objects collected. Verres, for example, did not hesitate to strip original vessels of their decorations in order to remount them on objects made in his own workshop, which was largely staffed by eastern and Greek craftsmen (Cicero, *In Verrem*, Act. I). Pliny (*op. cit.*, xxxiv, 8, 11) speaks of bronzes, "Corinthian" vases, and candelabra of Tarentine and Egyptian manufacture, and cannot resist poking fun at those who collected fake Corinthian bronzes. His pages contain no reference to any sort of production in Latin or Roman workshops.

In these circumstances we can speak only of a Hellenistic taste, not a Hellenistic-Roman taste, in the production of metalwork; this taste changed according to the time and place of production in deference to the differing tendencies and preferences of the area concerned, with that variety and richness of inflection so characteristic of Hellenistic culture. It is worthy of note, too, that in this branch of art Hellenistic taste survived long after its normal chronological limits, permeating works created when taste in sculpture or painting, to remain in the field of the figural arts, had already greatly changed. A typical example of this is the treasure of Graincourt-lès-Havrincourt (J. Charbonneaux, *RArts*, VIII, 1958, p. 2 ff.), belonging to the 2d century of our era, which faithfully reproduces schemes, models, and styles of silverware typical of an earlier century.

**HERETICAL SUBJECTS.** In the sphere of religious art of Christian inspiration or directly associated with Christianity, there are a number of images and figural objects inspired by heterodox movements. They are characterized by various themes emphasizing heterogeneous pagan reminiscences and their own particular symbolism. The character of these types became increasingly autonomous until, in late antiquity and the early Middle Ages, the movements themselves developed ideological and cultural traditions of definite form and parallel to orthodox traditions. Later the Church became the absolute arbiter of artistic expression. For the influence on art of the Christian Churches in modern times, see CHRISTIANITY; REFORMATION AND COUNTER REFORMATION.

SUMMARY. The Christian concept of heresy and its development (col. 412). Heretical movements from the 2d to the 9th century (col. 412). Heretical subjects in art (col. 413): *Monuments of Gnostic-Syncretistic heterodoxies; Arian monuments; Anti-iconoclastic themes; Surviving Manichaean themes.*

THE CHRISTIAN CONCEPT OF HERESY AND ITS DEVELOPMENT. A heretic is a baptized person who wishes to remain a Christian in name, but who obstinately denies or doubts some truth that is binding by authority of the Church. According to the definition of the Roman Catholic Church, a heresy is, objectively, a proposition that is at variance with dogma; subjectively, it is a denial, or at least serious doubting, of doctrinal truth by a member of the Church (*Codex Iuris Canonici*, canon 1325, par. 2).

In the Septuagint the Greek word for "heresy" (αἵρεσις) is used only in the literal sense of the term, "choice" or "selection"; in Flavius Josephus (*The Jewish War*, I, II, VIII, and *passim*) the word is used in the sense of "group" or "faction" but with neither a positive nor a negative connotation. (Josephus applied the term to Pharisees, Sadducees, and Essenes.) In the New Testament the Greek term is used in the sense of "sect," and so translated (e.g., Acts 5:17; 15:5; 24:5), but it is also used in a pejorative and condemnatory sense, translated in English by the term "heresy" (e.g., Gal. 5:20; I Cor. 11:19). Beginning with the Christian apologists of the 2d century, the term "heresy" always signifies a negative choice outside or against the Christian faith and the Church, in other words, a false doctrine. For example, Ignatius of Antioch says: "You should all live according to the Truth so that no heresy may insinuate itself" (*Epistula ad Ephesios*, VI); and "I admonish you all to take nothing but Christian (spiritual) nourishment; shun alien pastures, for there is heresy" (*Epistula ad Trallianos*, VI). The same sense and sometimes the same words are used by Justinus (*Dialogue with the Jew Trypho*) and by Irenaeus, whose *Tractatus adversus haereses* (usually known as *Against the Heresies*) is the first of its kind known. In other passages by Justinus and in Irenaeus the expressions ἑτεροδοξοῦντες or ετερόδοξοι ("heterodox") are used in contradistinction to τὰ αυτὰ δόξαντες that is, to the Church.

Definitions of the kind given in the *Codex Iuris Canonici* appear for the first time in Hippolytus (*Philosophumena*) and Tertullian (*De praescriptione haereticorum; De baptismo*, 15). The criterion for defining heresy is, since Tertullian, the *regula fidei* ("the rule of faith"). Cyprian of Carthage (*Epist.* 69, 7) also speaks of the *lex symboli* (i.e., the articles of belief), which distinguishes true believers from schismatics. An exact distinction between "heresy" and "schism" does not appear before the 4th century: *haeresis* is *perversum dogma* ("false doctrine"), whereas schism divides from the Church *propter episcopalem dissensionem* ("because of hierarchal dissension").

HERETICAL MOVEMENTS FROM THE 2D TO THE 9TH CENTURY. In the 2d century the Christian communities, which had gradually begun to mold themselves into the Church, were confronted not only with paganism and Judaism but with a number of sects more or less closely linked to Christian teaching and practice, whose origins, however, mostly lay outside Christianity, in the Gnostic-Syncretistic systems. What separated these groups from the Church was not only their deviations from the established liturgy and their refusal to acknowledge ecclesiastical teaching (in place of which they put their own highly "secret" revelations) but, above all, their distinctive eschatological notions. It would, therefore, be more exact to call them "heterodox" instead of "heretical."

Heresies, in the strict sense of the term, did not begin until the body of Christian doctrine and cult — including liturgical practice and canonically authoritative teaching — had assumed definitive form, itself evolving to a large extent under the impact of the dispute with Gnosticism.

The earliest artistic documentations of those heresies and heterodoxies date from the 3d century; their number is relatively small, chiefly because the ascetic sects were opposed to the veneration of images (see IMAGES AND ICONOCLASM). And a great deal of their art was later destroyed by the orthodox.

For the Christian communities, which themselves were *religio illicita* during the 2d and 3d centuries, there existed only two ways of combating splinter factions: ecclesiastical penalties (above all, exclusion from the church community) and theological disputation, in which it was attempted to convince dissidents of the sole truth of the doctrines of the Christian Church.

Later the formulation of church doctrines and ordinances during and after the First Nicene Council (A.D. 325, at Nicaea) as well as the rise of Christianity, first to a position of equality and after 381 to the position of sole official state religion, made it possible to define "heresies" much more precisely and, above all, in a universally binding manner. Furthermore, it enabled the Church to make increasing use of the coercive powers of the state in its struggle against heretics. As time went on, transgressions against church doctrines and ordinances were regarded more and more as crimes against the state and were punished at an even earlier date and more severely than paganism. While participation in pagan sacrifices was punished with banishment and confiscation of property only after 423, and the death penalty and withdrawal of the last privileges of the temples were imposed at an even later date, the first in the long series of edicts against heretics made its appearance as early as the 4th century. The heresies of Manichaeanism, Sabellianism, and Arianism were already excluded from the general freedom of cults expressly granted in the year 370. Further laws in 372, 380, 381, and 395 progressively increased the severity of the punishment of heretics. The punishments included ignominy, denial of the right to bear witness, confiscation of private and communal property, and burning of writings. In 410 and 415 the death penalty was instituted against heretical priests and leaders of sects. The heretics, in turn, proceeded against the orthodox with the same harshness whenever they succeeded in getting the state on their side, as the Arians did during the 4th century and the iconoclasts in the 8th and 9th centuries. Proof of the bitterness with which the dispute was conducted on both sides, apart from the evidence contained in literary sources, appears in violently antiheretical art, especially during later periods. This hatred resulted in the extensive destruction of heretical art, of which the few survivals owe their preservation mostly to chance.

HERETICAL SUBJECTS IN ART. *Monuments of Gnostic-Syncretistic heterodoxies.* Of all the adversaries of the nascent church — paganism, Judaism, Gnosticism — the last was the most dangerous. The Gnostics formed their doctrines from pagan-Oriental, Hellenistic-philosophical, Jewish, and Christian ideas and concepts (hence the term "syncretism"), especially those doctrines which deal with the origin of the divine persons and of man and with the destiny of the believers after death. The interpretation of what survives of their artistic monuments is largely hypothetical. A great deal must remain completely unexplained, because the Gnostic revelation was restricted to a small circle of initiates who observed a strict arcane discipline, and because of the almost complete destruction of the Gnostic literary legacy by the Church.

The most important group of monuments that has survived from the Gnostic-Syncretistic heterodoxies consists of a number of underground burial chambers in Rome. As in the paintings of the Christian catacombs of the 3d and 4th centuries, the central theme of the monuments is the believer's hope and assurance of overcoming death. For Christians this is expressed in Biblical paradigms, prefigurations (e.g., Daniel in the lions' den, the deliverance of Jonah, the raising of Lazarus), and symbolical representations of the water and the bread of life (i.e., baptism and the Eucharist), sometimes depicted openly and sometimes in the guise of Biblical scenes or single figures. The most frequent representation of Christian salvation, however, is the Good Shepherd gathering the lost sheep into the heavenly flock (see BIBLICAL SUBJECTS; ESCHATOLOGY).

In the decorative scheme of heterodox tombs these representations are either supplemented or replaced by scenes appertaining to specific heterodox rites and concepts (see CATACOMBS). Thus, for example, in the Hypogeum of the Flavii of the Catacomb of Domitilla (first third of 3d cent.), next to two scenes from the Old Testament, there are a depiction of a funeral feast, hallowed pagan landscapes, fertility idols (herms of Priapus), and pictures of the myth of Cupid and Psyche, the last being the most frequent pagan symbol of immortality at that time. The paintings on the attic slab and ceiling of the rear chamber of the tomb of Clodius Hermes in Rome are partly Christian and partly heterodox. Above the entrance there are scenes from the New Testament; a prothesis (i.e., a lying-in state) and a Judgment of the Dead are depicted in two lateral clipei in the burial chamber itself; in the central octagon (the place where the Good Shepherd is usually depicted) is the floating "appearance" of the Mystagogue or so-called "Saviour" addressing his followers, the members of the secret sect that used the burial chamber (PL. 217). Particularly striking about this figure is his costume: instead of the white pallium in which saints, apostles, philosophers, and masters were usually depicted in the 3d century, he wears a red military cloak, and he is shown in the same attire in the two lateral scenes.

It has not yet been established to which sect the founder and the dead of the Hypogeum of the Aurelii in Rome belonged. Here, too, in the most extensive cycle of heterodox paintings of the 3d century, side by side with definitely Christian subjects (e.g., the Fall, the creation of Adam, and repeated representations of the Good Shepherd) there are several scenes whose interpretation is still disputed. One of the most interesting is the ceiling panel of the second chamber, showing the initiation or benediction of a veiled woman (PL. 218) between two pallium-clad men, one of whom is holding a scroll while the other appears to consecrate or bless her with the so-called *virga thaumaturga* (a wonder-working wand). Even more interesting are the scenes on the great painted friezes in the principal chamber. In one of them a bearded man dressed in a pallium is seated on a mountain, at the foot of which a flock of sheep and goats are grazing while he reads from an open scroll. He should be considered a mystical holy shepherd rather than Christ.

Likewise, it would hardly seem justified, though attempts have been made, to attach a Christian meaning to certain other scenes: the arrival of a "dominus" at a large city whose populace goes out to meet him; a banquet of 12 men, one of whom is signalized by an *impositio manus* ("imposition of hands") by a female figure behind him; a judgment in a forum; the *introductio* or *acceptatio* by a female figure of two deceased persons in a paradisiacal garden (worthy of notice are the white-robed guardians at the gates of the town and of the garden); and another paradisiacal scene usually referred to as "The Return of Odysseus." (An object in the foreground of this last scene was once thought to be a weaver's loom, hence the allusion to Odysseus; however, the object is probably a badly drawn gate.) It cannot be clearly established whether the extremely impressive figures of pallium-clad men (more than 3 ft. high and partly ranged in processional order) in the lower wall panels are apostles or initiates of the Brotherhood of the Aurelii.

The only unquestionably heterodox hypogeum is the Arcosolium (or arched tomb) of Vibia, which forms part of the area of the Christian Catacomb of Praetextatus in Rome. Its connection with a sect known as the Sabazians is securely attested by an inscription of its founder dedicating it to the sect. Despite some definitely orthodox inscriptions found in the immediate proximity of the Arcosolium of Vibia, this dedicatory inscription permits us to include the tomb in the sphere of heterodox art.

On the intrados of the arch of the main arcosolium — the façade of which bears the name of its founder, Vincentius, and that of the deceased, Vibia — the fate of Vibia after her death is depicted in three stages. The first scene, *abreptio* and *discensio*, shows Pluto carrying off the inanimate body of Vibia in a quadriga led by Mercury. The second scene, in the center panel, represents Vibia's judgment: Mercury as herald leads Vibia before the throne of the *Dispater* and of the *Aera Cura*, next to whom three *Fata divina* stand in waiting. The third scene, in the lower right-hand panel of the arch, is a banquet of the *Septem pii sacerdotes* ("the seven holy priests"), one of whom is Vincentius. The Eastern origin of the sect is apparent from the Phrygian caps worn by three of the priests. The lunette shows the assumption of the deceased into the realm of the blessed, who are assembled for the *refrigerium*: the *Angelus bonus* (Mercury or Hermes Psychopompos) leads Vibia (*Introductio Vibies*; PL. 218) through a gate into the paradisiacal landscape, in which the *Bonorum iudicio iudicati* sit at a meal, with Vibia among them. The strikingly large amphora at the side of the table recalls similar motifs in an anonymous hypo-

geum (of Cava della Rossa), possibly the burial place of members of the sect of the Valentinians. In the wall paintings here too, along with the Good Shepherd and Biblical scenes, there is a *refrigerium* with a number of exceptionally large amphoras. Moreover, the number (12) of participants at the banquet and the fact that both men and women are present are characteristic indications of heterodoxy. (The Christian catacombs and sarcophagi of the period depict banquets of men only.)

Two heretical tombs of the 4th century, the Hypogeum of Trebius Justus and the hypogeum known as Diana's (Via Lavenza), have been known for some time. An extensive anonymous catacomb under the Via Latina was discovered in 1955. The sect that buried its dead in these extensive grounds under the Via Latina was not afraid (even long after peace had been established between the orthodox church and the state) to use pagan mythology and other subjects, whose symbolic (?) content is not quite clear, in close proximity and frequently even in the same room with scenes from both the Old and New Testaments; a whole series of Biblical scenes occurs here for the first time. This discovery has deprived the mural paintings in the tomb of Diana of some of the uniqueness that had hitherto been attributed to them. In these murals Diana the huntress and a nymph appear alongside Moses drawing water from the rock, that is, a pagan fountain deity is represented together with a Christian symbol of the water of life.

The Hypogeum of Trebius Justus is generally regarded as orthodox Christian on account of the picture of the Good Shepherd on its ceiling. But the offertory scene above the tomb (PL. 218) and the depiction of the magister on one of the side walls at least suggest that its founder may have been a heterodox Christian.

When considering other art objects of the Gnostic-Syncretistic heretics — amulets, rings, and other works of miniature and folk art — it becomes even more difficult to distinguish clearly between the Christian and the heterodox legacy of imagery and concepts. Therefore consideration must be limited to a few typical examples. A cylindrical metal container (of North African origin) bears a Biblical inscription (Isa. 12:3), representations of the Good Shepherd, a stag drinking from a rock marked with a cross, arena scenes (e.g., animal hunts), pictures of Nike with a palm and cross, and other similar decorations. The Good Shepherd and other Christian symbols appear on the face of an amulet along with the legend Ἰησοῦς, while the reverse shows the son of Horus sitting on a lotus and is inscribed with the word χριστός. The handle of a Coptic jar is adorned with a cross, the figure of Astarte, and doves. There is a whole collection of bracelets from Egypt bearing a verse from the Psalms (90:1) and scenes from the New Testament — Annunciation, Nativity, Baptism, Crucifixion, empty tomb, and Ascension — all of which are in close conformity with the pictorial canon known from the ampullae of Monza; the center medallions bear many Gnostic apotropaic symbolic signs together with the Solomon-Sisinnius horseman. Other pieces contain the formula "Abraxas," the acrostic "IAW," and the names of the archangels next to the figures of theriomorphic deities (?). It is the works of miniature, and folk art in particular, that give a clear indication of how long the Gnostic heterodoxies (albeit as an undercurrent and especially in the East) continued as a living tradition.

In conclusion, mention should be made of a monument that must be classified as of Christian origin because of the general context in which it was discovered, the details of which, however, indicate a heterodox community. This is the floor mosaic of the room of the laity of the church of the Christian cemetery of Teurnia (Carinthia), dating from about A.D. 500 (PL. 219). It consists of 12 panels. One of them bears the inscription of the founder, and another only a decorative checkerboard design. On the other panels a variety of scenes are depicted: animals fighting serpents or being threatened by them; three groups of animal families (a suckling hind, a duck with ducklings, two hares); a chalice with paten (on which a dove is pursued by serpents); a bull; a tree (of life ?) on which pairs of birds are sitting; and a stork (?) catching a lizard.

It would appear that Christian concepts (the chalice and paten), Gnostic-Oriental ones (serpents as symbols of the dark powers of the netherworld), Mithraic ideas (the bull), and some of Germanic origin (the Tree of Life in PL. 219) are all joined together here in a conceptual unity, the meaning of which, however, can no longer be deciphered.

Unfortunately, what remains of the mosaics of the Baptistery of Hemmaberg, Carinthia (ca. first half of 5th cent.), in which bird motifs repeatedly occur, is not sufficient to help in the interpretation of the mosaics of Teurnia.

*Arian monuments.* After the First Nicene Council (325) the unity of the Church and of the faith, which had only just been effected, continued to be gravely threatened by the doctrines of Arius (d. 336). And the Arian heresy remained a serious danger well into the 6th century, even though the Edict of Thessalonica (379) and the canons of the First Council of Constantinople (381) had officially settled the dispute between Athanasians and Arians by binding the Orthodox Church once again to the canons of Nicaea and the doctrines of Peter and of Damasus. In the 6th century ecclesiastical and political aspects of the dispute became bound together because the Germanic tribes that conquered the western provinces of the Empire were Arians. Thus the war waged by Byzantium against the Germanic tribes was also a war against the enemies of the unity of the Church, so that every military victory over the invaders was followed by the immediate and thorough Catholicizing of the heretical churches. This explains why only very few works of Arian religious art have survived, and only those whose heretical affirmations could, if necessary, be reconciled with orthodox doctrine.

The most important monuments of Arian art that have been preserved are in Ravenna: the mosaic in the cupola of the Baptistery of the Arians (now S. Maria in Cosmedin) and the New Testament scenes in the nave of S. Apollinare Nuovo. In the former the central medallion, the Hetimasia (preparation of the throne) and the figures of St. Peter, on one side, and the first two apostles, on the other side of the throne, date from Gothic times. (The remaining apostles are a later restoration.) To what extent the iconographic divergences from the mosaic in the cupola of the Baptistery of the Orthodox (also in Ravenna) are attributable to specific Arian notions is a matter of controversy. In the orthodox mosaic the procession of the apostles does not converge toward the Hetimasia; the Hetimasia itself is repeated four times and occupies its own separate zone. However, in the mosaic scenes of the Life and Passion of Christ in the nave of S. Apollinare Nuovo, Arian concepts about the nature of Christ are more clearly demonstrable: in the scenes depicting miracles Christ is shown as a beardless youth, but in the scenes of the Passion he is portrayed wearing a beard. After the second Council of Constantinople (A.D. 553), when *Unus ex Trinitate passus est carne* ("One person of the Divine Trinity suffered in the flesh") became the officially sanctioned formula of the Passion, all depictions showing Christ suffering as man became suspect as heretical and, more especially, as Arian. Nevertheless, the scenes from the New Testament were allowed to remain in their original form when the lower wall panels were subjected to thorough alterations during the Catholicizing of the Church of S. Apollinare Nuovo.

Although only a small number of Arian works of art have been preserved, there are a very large number of depictions recording the intense bitterness with which the orthodox persecuted that heresy; until well into the Middle Ages, Arius was regarded by the Catholic Church as the heretic par excellence. An example is the Menologion of Basil II, with an illustration of the First Nicene Council (325), where Arius is shown prostrate on the floor at the feet of the Emperor and the orthodox Fathers and bishops (PL. 220). Another example is a manuscript in Paris depicting atrocities committed by the Arians: orthodox bishops and priests cast adrift in a burning boat by Arians; Arians setting fire to a church (PL. 220); and the martyrdom of an old man of the orthodox faith at the hands of Arians. In the New Minster Offices (1023–35; Br. Mus., Cotton Ms. D. xxvii, fol. 75v) there is a representation of the

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

Digitized by Sarayu Foundation Trust, Delhi and eGangotri. Funding:IKS

Quinity (i.e., the Trinity and Mary with the Child Christ). In Byzantine pictorial canons of the First Nicene Council the above-mentioned representation of Arius at the Council appears again and again, though in a slightly different version: Arius having his face slapped by St. Nicholas. These and other vilifications of heretics are also prescribed for pictorial treatment of the Council in the *Painter's Manual of Mt. Athos*. The wall paintings of the great synods of the church in the portico of St. Peter's in Rome (712) and in Naples (ca. 790), both of which are lost today, were probably of the same character.

Specifically antiheretical themes are relatively rare in medieval Christian art in the West: when they occur, it is in the form of a personification of Heresy, used here and there as a counterpart to the concept of "Synagogue" (PL. 220). More frequently, however, "false prophets" and heretics are represented in the shape of animals, usually a monkey or a fox. Jewish heretics are depicted in a manuscript of Rabanus Maurus (Montecassino, Archivio dell'Abbazia, Ms. 132, p. 72): their eyes and mouths are closed, indicating that they neither want to see nor worship the truth. Another miniature of the same manuscript (p. 278) depicts unbelievers falling into the abyss.

*Anti-iconoclastic themes*. The anathematization of the iconoclasts also found expression in art, and at least a few examples may be cited. The richest material is to be found in the so-called "marginal Psalters," a group of Psalter manuscripts richly embellished with marginal miniatures, dating from about the second half of the 9th century and later.

The Khludov Psalter (Moscow, Hist. Mus.) contains numerous examples of anti-iconoclastic themes. There is a representation of the Iconoclastic Council of 815 in which a layman is trying to daub pitch over an icon of Christ (fol. 23). There is a representation of the impeachment of the iconoclastic patriarch John Grammaticus (called Jannes) for simony, and his denunciation as a second Simon Magus. (Folio 35v shows the triumph of St. Peter over Simon Magus and, below that, the triumph of the patriarch Nicephorus over Jannes.) A bishop who refuses to pay homage to the icon of Christ but consecrates priests for money is compared to the Jews who tried to bribe the guardians at the tomb of Christ (fol. 67). And the destruction of an icon of Christ is compared to the Crucifixion itself (fol. 67v). Especially grotesque is the representation of the iconoclastic heretics (fol. 70v) in which two monks are depicted with animal jaws and "slanderous tongues" that reach to the ground.

*Surviving Manichaean themes*. Against no other heresy did the church show itself quite so severe and inexorable as against Manichaeanism (though in the strict sense of the term it was not a heresy, but a distinct religion). According to Persian tradition, Mani had been a Christian priest before founding the community named after him; his doctrines embodied Persian, Christian, and Buddhist elements. To the Christian Church he was the veritable Antichrist right into the Middle Ages. No doubt, this was partly due to the fact that the Church was relatively well informed about his teachings: St. Augustine had belonged to a North African Manichaean community for many years, and after his conversion had attacked this sect in a number of writings.

The succession of anti-Manichaean edicts extended from the year 377 to the middle of the 11th century, and some of the medieval heretical movements (the Bogomiles and the Cathari) were called "Neo-Manichaeans" because their doctrines derived from Manichaean traditions. The Manichaeans were also the first heretics against whom the death penalty was instituted and carried out (385). The earliest anti-Manichaean edict was issued by Diocletian in 296, barely 20 years after the death of Mani; it also ordered the execution of the Manichaean priests.

The persecution of this religious community in the West led to the complete destruction of all its artistic records and documentation. But in Turfan (western China), where Manichaeanism was the state religion for a time in the 8th and 9th centuries, wall paintings and fragments of illustrated manuscripts, together with important literary relics, were found at the beginning of the 20th century (see MANICHAEAN ART). In one mural of the Manichaean temple of Khocho (Sinkiang prov.) the figure of the high priest seems to represent Mani himself, for it is only the halo of the largest figure that has the emblems of sun and moon, and it is only the tiara worn by that figure that is richly ornamented. Furthermore, a fragment of an illustrated manuscript contains a scene that bears a striking resemblance to a well-known pictorial theme of Christian iconography, namely, Adam and Eve being condemned to work, which itself played a definite role in the teaching of Mani.

**HERRERA,** JUAN DE. Spanish architect (b. Mobellán, Santander, ca. 1530; d. Madrid, Jan. 15, 1597). On Oct. 2, 1548, Herrera left for Italy, Germany, and the Low Countries in the following of his prince, the future Philip II of Spain. Returning to his native country in 1551, Herrera again went to Italy in 1553. He took part in the campaign of Flanders under Emperor Charles V and later served the Emperor in his retirement at Yuste, Estremadura. At the death of Charles in 1558, Herrera entered the service of Philip II.

Herrera was a soldier and a courtier as well as an architect. He stated that his highest ideal was to serve his King, recording that "from the year 1565 on I undertook to follow His Majesty constantly wherever he might go." He further noted that "during the voyage in Portugal I spent not less than 6,000 ducats because of the many times I stayed, went, and came for that kingdom, and in places where it was impossible not to spend excessively nor do less than show oneself the servant of so great a prince" (Memorial a Mateo Vázquez, see Llaguno y Amirola, II, 1829, p. 333). He spent his life at court and, as did Velázquez later on, filled the office of palace marshal (*aposentador*).

Herrera's position with Philip II, a sovereign greatly interested in the arts and particularly in architecture, was one of eminence. The architect's emergence from obscurity may have resulted from his active interest in science and mathematics. In 1562 he made a series of geometrical illustrations for an abridgment of Alfonso el Sabio's book on astronomy, a work which may have originally brought its illustrator to the attention of Philip. Herrera's contribution to the astronomy book is all that is known about his scientific talents before he was appointed by the King (Feb. 18, 1563; Madrid, Arch. General del Palacio Real) to assist the court architect, Juan Bautista de Toledo, on the Escorial monastery. From that time on, Herrera's participation in the building of the monastery became increasingly evident. "At the end of the year 1564," states Luis Cervera Vera (1954), "the importance of Juan de Herrera in the construction of the monastery can be discerned in the notes between Philip II and Pedro de Hoyo." In 1567 Juan Bautista died and Herrera became his successor, assuming the post of

a superintendent of official construction — a forerunner of the *surintendants des bâtiments* of Louis XIV.

The Escorial monastery was Herrera's first work; it was also his last and most important, for it occupied and preoccupied him throughout his life. It is necessary, therefore, to trace the history of this singular structure. On Aug. 10, 1557, the commemorative day of St. Lawrence, the forces of Philip II engaged in a decisive battle climaxed by the routing of the French and the capture of Saint-Quentin. To celebrate the victory, Philip decided to dedicate a great monument to St. Lawrence. That this monument should be a monastery grew out of the will of Emperor Charles V, who charged his son with the mission of creating for him and the Spanish Hapsburg family a "dynastic pantheon," as it is explicitly called in the royal decree issued Apr. 16, 1561 (Madrid, Arch. General del Palacio Real). The Hieronymite monks, a powerful Spanish order, were placed in permanent charge of the religious services for the deceased. After many deliberations, Philip II chose a site in the vicinity of Guadarrama, near the small village of El Escorial, 30 miles northwest of Madrid. Many doubts, however, beset the King when it came to choosing an architect worthy of this great undertaking. Italian masters were considered, including Michelangelo, who by then was too old; but finally Don Pedro de Toledo, who had been viceroy of Naples until 1553, proposed his protégé Juan Bautista de Toledo. On July 15, 1559, Juan Bautista was invited to leave Naples and proceed to Madrid as architect in the service of the King.

Very little is known of Juan Bautista's work in Naples. Of his specific experience as an architect we know only that he served his apprenticeship in Italy. According to a document in the official archives of Naples, Juan Bautista was a royal engineer who worked in one of the bastions of Castel Nuovo at a monthly salary of 10 ducats. His alleged collaboration with Michelangelo cannot be confirmed. In any case, Friar José de Sigüenza, historian of the Hieronymite order, called Bautista "a man of many talents, a sculptor also practiced in drawing, who knew Latin and Greek and had a good knowledge of philosophy and mathematics." According to the friar, Juan Bautista incarnated the Vitruvian ideal. Our lack of more specific information on Juan Bautista is regrettable, since he seems to have been Herrera's only teacher.

By royal decree of Aug. 12, 1561 (Madrid, Arch. General del Palacio Real), Philip II named Juan Bautista de Toledo his chief architect, commissioning him with the plans and models of works to be built. In the following year Juan Bautista designed the general plans of the immense monastery building. Pedro de Tolosa and Lucas de Escalante assisted as building overseers. It is important to note that Herrera had been named assistant to Juan Bautista two months before the laying of the first stone (Apr. 23, 1563), which means that he took part in the project from its beginning and not merely after De Toledo's death, as had been believed. The task entrusted to Herrera was quite different from that assigned to the building overseers: the new assistant was placed in charge of the theoretical aspect of the work, including the plans. Thus the Escorial monastery became one of the first constructions in Spain organized according to true Renaissance criteria; a collaborating team of architect and builder now replaced the old Gothic building master who had planned everything alone. The word *architettore*, first used by Juan Bautista and then by Herrera himself, was imported from Italy, together with the new architectural concepts that linked it to Humanism.

At his death Juan Bautista had almost completed the great southern wing (the façade called the "Friars' Garden"), imposing in its size, severity, and simplicity. The first floor of the Court of the Evangelists (PL. 221) was finished, and work was proceeding on the second floor. To Herrera remained the great responsibility of executing the remaining façades and, above all, of erecting the church, which, according to Friar Sigüenza, was the "main preoccupation of His Majesty, being the ultimate aim and, so to speak, the sum of what had been undertaken." Thus Herrera became not only Juan Bautista's successor but also the continuer of his ideas. Philip II placed his trust in Herrera with some reserve at first and did not immediately accord him the official titles — perhaps in consideration for other older and more experienced artists; later on, however, the King indicated complete confidence in Herrera.

Erection of the Escorial church, perhaps the most important Renaissance building since St. Peter's in Rome, was nonetheless the cause of much uncertainty on the part of Philip II, who solicited plans in both Spain and Italy. A certain Pacciotto or Pachote, a little-known Italian engineer, submitted several projects; to what extent they were used, however, is not known. The church as we see it today (PL. 222) must be regarded as the creation of Herrera himself, unless other documents are brought to light. On June 14, 1575, Pedro de Tolosa and Lucas de Escalante laid the first stones of the gigantic piers of the dome, which was finished June 23, 1582. On Sept. 23, 1584, after 21 years of collective work, the monastery was also finished (PL. 223).

Even as an artistic expression, the Escorial presents much that is difficult to classify unless it is seen as the realization of the ideals of its founder, Philip II, who assiduously followed its construction. More than most people of his time, the King was aware of the critical period in which he lived, and tried to overcome its difficulties. He saw that the old world was crumbling, that basic values and principles were vanishing with it, and that even the concept of the divine right of monarchs was in doubt. In this gigantic reliquary of a monastery he wished both to conserve the past and to prepare for the inevitable arrival of a future illuminated by the critical spirit of Humanism. He conceived of his monument as a synthesis in which the ancient spirit, represented by the Scriptures, would be conciliated with the modern, incarnated in the Vitruvian ideal. His explicit idea was to resuscitate the Temple of Solomon (according to Friar Sigüenza), but the syncretism inherent in his spirit led him to conceive this within the restricted canons of Greco-Roman classicism. The Escorial is thus an attempt at uniting the civilization of the classic world with the truth as revealed by the Scriptures. This dual purpose is what gives the monument that ambitious timelessness pointed out by Louis Bertrand, who said that "the Escorial has neither a particular period nor form; it is as impersonal and abstract as the monuments of ancient Egypt." Philip II leaned toward the most depersonalized sector of Renaissance art, known as the Roman school, in which a phase of stabilization and recapitulation had succeeded a fertile and creative period. At that time, impersonal architects flourished who translated into standard rules and definitions the earlier products of intuitive or artistic genius. In such an esthetic climate, stifling the free will of the artist, Philip felt at ease.

The Escorial style, therefore, was not born of the personal genius of a great master. It was a style which created itself and grew from the work itself. It was not so much that the artistic genius of Herrera created the work as that the work stimulated the artistic genius. Although the Escorial style had no precedent on Spanish soil, it influenced more than a century of Spanish art. However, a certain stylistic sequence can be established into which the Herrera building seems to fit, if one does not lose sight of the peculiar intrinsic conditions of this unique structure. The publication of the third and fourth books of S. Serlio's *Architettura* (in Francisco de Villalpando's Spanish translation, 1552) acquainted Spain with the taste of this Bolognese master, who had been a student of Baldassarre Peruzzi (q.v.). Further, the famous treatise *Regola delle cinque ordini d'architettura* by Vignola (q.v.) was published in Rome in 1562, a year before the first stone of the Escorial was laid. (Vignola had been consulted about the building of the monastery.) But neither the will of the founder nor the unusual needs of the work itself, which was without parallel in Italy, could be really satisfied with foreign contributions. We must return to our first thesis — that the monument created its own style.

The prestige Herrera acquired in the service of the King entitled the architect to take into his own hands various royal building enterprises which had previously been divided among various masters. Of the royal residences, the Alcázar of Toledo and the Palace of Aranjuez are Herrera's most important works. Plans for the southern façade of the Alcázar were ready in 1571,

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

and under the direction of Jerónimo Gili and Diego de Alcántara the building was finished in 1585. The Alcázar is one of Herrera's most "Vignolesque" constructions, recalling Vignola's Palazzo Farnese at Caprarola (I, PL. 388). Plans for the new Palace of Aranjuez, by Juan Bautista de Toledo and Herrera, were prepared about 1564. Construction was suspended in 1586 and was not completed until the advent of the Bourbons. To Herrera must also be attributed the first nucleus of the town hall of the city of Toledo, continued after 1612 by El Greco's son, Jorge Manuel Theotocopuli. The Exchange in Seville, built between 1593 and 1598, is one of Herrera's most finished works, an admirable example of faithfulness to the Vitruvian canons of symmetry. Juan de Minjares was charged with the construction, since Herrera could not leave the Escorial.

Herrera also had a hand in the upper story of the western façade of Charles V's palace in Granada and supplied plans for the Church of S. María in the Alhambra. He took part in the renewal of Madrid under Philip II and constructed the bridge of Segovia in Madrid, as well as other smaller bridges along the road between the capital and the Escorial. He was responsible for many other works in the royal lands, leaving unmistakable witness to his skill and high ideals of architecture. His influence was extensive and profoundly felt in the development of the national architecture.

Beginning in 1584, a serious illness kept Herrera almost completely away from active construction work. It was at this time that he made his will. Continuing poor health forced him to rely on the assistance of his pupils, particularly Francisco de Mora. At this time Herrera was also head of the Academy of Mathematics, which, at his suggestion, the King had founded in 1582; the architect's talent in this field is indicated by his invention of nautical instruments to safeguard navigators.

The culminating point of Herrera's career was to have been the Cathedral of Valladolid (PL. 224; III, PL. 316), had not his illness and subsequent death prevented this. The first actual information we have concerning construction on the Cathedral dates from 1589. By 1593 Herrera's illness required him to give up all activity, and four years later he died, in the parish of Santiago near the Alcázar, Madrid, where he had long lived. He left a daughter, Lorenza, by his second marriage in 1581 to Inés de Herrera. (His earlier marriage, to María de Alvara, was childless.) At the master's death, the work was left in the hands of his pupils and their students, who gradually altered and debased the original conception. Alberto de Churriguera (see CHURRIGUERESQUE STYLE) finally disfigured the Cathedral completely with a baroque façade. Construction was suspended at the beginning of the transept, thus truncating the longitudinal extension of the building, which Herrera had planned as a perfectly symmetrical whole with a choir of four bays, balancing a nave of equal length.

Herrera's immediate successor was his collaborator Francisco de Mora, faithfully followed by Francisco's nephew Juan Gómez de Mora, creator of the Plaza Mayor and various monasteries in Madrid. In Toledo, the artists most closely linked to Herrera's school were Nicolás de Vergara el Mozoz, Juan Bautista Monegro (a sculptor who had worked extensively at the Escorial monastery), and Jorge Manuel Theotocopuli. There developed in Valladolid a center of Herreranism, with the Cathedral as its focus, which spread all over Castile and the northern parts of the peninsula. The best-known names of this school are Juan, Diego, and Francisco de Preves (who translated Palladio's *I quattro libri dell'architettura*); Juan de Nates, who collaborated in various large-scale works such as the Church of Sta Cruz in Medina de Rioseco and the Colegio del Cardenal in Monforte de Lemos; and Alonso and Juan de Tolosa (designer of the severe hospital of Medina del Campo), sons of Pedro de Tolosa, building overseer in the construction of the Escorial.

**HILDEBRANDT**, JOHANN LUKAS VON. Architect (b. Genoa, Nov. 14, 1668; d. Vienna, Nov. 16, 1745). Hildebrandt was trained in northern Italy and in Rome under Carlo Fontana. In 1696 he settled in Vienna, where he had spectacular success for nearly a half century. His work and influence extended over most of Austria, into Bohemia and Hungary, and west to Würzburg and the Main-Franconia region.

Two dualities were important to Hildebrandt's development: he was bilingual, and he was both architect and engineer. Although of German parentage — his father was an army officer — he lived in Italy until he was almost thirty. Thus his architecture had strong Italian roots, though its inflection was strikingly Austro-German. Indeed, Hildebrandt, along with his older competitor Fischer von Erlach (q.v.), was the most important bridge between Italian baroque and Austro-German architecture of the 18th century. His style implies a knowledge of building in Genoa and Turin (notably Guarini's Palazzo Carignano, PL. 104), of Palladian residences in and around Vicenza, and of the work of Bernini and Borromini in Rome.

In 1695 Hildebrandt volunteered as an engineer in the imperial army and served under Prince Eugene of Savoy during three campaigns in Piedmont. Immediately afterward he sought his fortune in Vienna. By 1700 he was court architect, and commissions began to come in from the great families. His first palace design, the Schwarzenberg, Vienna, 1700–15, set an important precedent; and the Piarist Church, Vienna, set another, for centrally planned churches. Most important among his patrons was Prince Eugene, for whom he enlarged a city palace (II, PL. 159) and built the Belvedere (Lower, 1714–16; Upper, 1721–23, II, PL. 158; gardens, 1716–21). The Belvedere is Hildebrandt's masterpiece as both a work of architecture and engineering, if one may so term its elaborate terracing and waterworks. For the Schönborns he built a garden palace in Vienna, a country palace at Göllersdorf, and the abbey of Göttweig. For their cousins in Franconia he was consultant in the design of the great staircase at Pommersfelden, the Residenz at Würzburg, and the Schönborn Chapel there. For the Harrach family he built residences in Vienna and the Schloss

**HINDUISM.** The term "Hinduism" conventionally designates the concept of the world and the whole corresponding system of social and ethical norms constituting the present-day religion of non-Islamic India, of which Buddhism and Jainism (qq.v.) may be regarded as heterodox manifestations. The art forms which Hinduism inspired are governed by rigorous iconographic and iconometric rules and have both a symbolic and a practical purpose, since they are conceived as a means (Skr., *upāya*) to arouse, in the perceptive viewer, the revolution of the planes of consciousness that releases man from the temporal dimensions of existence (Skr., *saṃsāra*). Despite these partly utilitarian aims, however, Hindu art often attains elevated levels of esthetic quality and thereby a universal validity.

SUMMARY. General characteristics (col. 423). Image and cult (col. 428). The temple and the cosmos (col. 430): *Cosmology and the sacred edifice; Dynamics of the temple; The temple and time.* Esthetics and spirituality (col. 435).

GENERAL CHARACTERISTICS. The term Hinduism, which has no equivalent in the various languages of India, is a European invention. Embracing a myriad of cults and sometimes widely divergent religious standards, it nevertheless corresponds to a reality, an undeniably complex and labile reality, extremely hard to define except as the religion of India par excellence, though by no means the only one. Although Buddhism succeeded in conquering a large part of Asia, and even though Hindu missions exist in both Europe and America today, it is almost impossible to conceive of a propagation of Hinduism that would not involve adoption of the specifically Indian way of life. Indeed, Hinduism is so integral a part of Indian civilization that its introduction into southeastern Asia and Indonesia was due not to missionaries, as was the case with Buddhism, but to the immigration of large groups of Indian peoples and the contingent propagation of Indian philosophical concepts (such as those of the cosmos and of time) and, more especially, of Indian political and juridical doctrines. Hinduism is in fact not only a religion or a constellation of religions; it is also a way of life and a social order, of which the Brahmans are the self-appointed defenders. (Indicative of their position is the fact that the authority of the Brahmans has never been disputed in juridical matters, even during the period in which Buddhism predominated in India.) Hence the difficulties encountered in any attempt to define Hinduism in terms of its dogma. Failing to realize that it is precisely the vagueness of its dogma, the counterpart of its extraordinary variety, to which Hinduism owes much of its power in India and prestige abroad, cultivated Indians have felt it incumbent on them to define the essence of their faith, with the not infrequent result of finding themselves reduced to such statements as "anyone who does not reject this denomination is a Hindu" or "there exists no belief common to all who declare themselves Hindus." These are, however, exaggeratedly contrived statements. Every Hindu is expected, at least in principle, to acknowledge the authority of the sacred texts, or Vedas; but it is above all the peculiarly Indian concept of man's status in the universe, in its eschatological and social aspects, that determines the whole system. The gods, at this point, are out of the picture; it is Karma that moves the world. By virtue of its intrinsic power, all action engenders retribution, and man's existence is governed by an immemorial past. The caste system, in particular, is merely the recognition of the fact that as human beings are born slaves to their Karma, that is, to the residue of their past actions, so are they unequal in fact and before the law; in the human hierarchy the Brahmans occupy a truly divine eminence. Moreover, a human life represents hardly more than a negligible episode in the course of an individual destiny, since the power of fate (that is, of the consequence of one's actions) drags the soul (Skr., *jīva*, *pudgala*) into an interminable transmigration from one existence to another. These ideas appeared only toward the 8th century B.C., for Hinduism as such, though it originated in part from the religion imported into India by the Aryan invaders in the 2d millenium B.C., is of relatively recent date. It is the outcome of a lengthy evolution.

India was already an infinitely complex country, rich in tradition, by the time the Aryans introduced into the Punjab not only a new way of life and new forms of thought but also what was to become the sacred language of all India, the new language in which this civilization found expression. Figuratively speaking, Hinduism may be regarded as an invasion of the Aryan religion by Indian exuberance and vitality. By the time this fusion, of which Vedism and Brahmanism were the initial stages, was completed, the Aryan religion could claim to be fully assimilated and the Aryans themselves to have lived on Indian soil since time immemorial. Compared with the confusion of the indigenous religious traditions, the Aryan element, which was eventually absorbed into the immensity of India, is relatively easy to define, for Vedism is known through texts — the liturgical compilations from which it derives its name, the Vedas. Although the Vedas are actually Indian, or rather Indianized, they retain echoes of the Greco-Roman polytheism to which they are related. However, ritual assumed considerably greater importance in India than had been assigned to it in classical paganism, and it was above all else the accentuation of this characteristic that constituted the evolution of Vedism and its transformation, shortly before 1000 B.C., into Brahmanism. In the Brāhmaṇas, exegetical texts edited by the Brahmans, who were the masters of the sacrificial ritual, the sacrifice assumes cosmic importance; regarded as the support of the entire creation, it is deified under the name of Prajāpati; without the sacrifice the gods would not exist. The ritual word, or *brahman*, becomes a mysterious power superior to that of the gods, and the Brahmans, who are its custodians, *ipso facto* play a leading part in the maintenance of the universal order.

The Brāhmaṇas — just as the late Vedic hymns which had preceded them — manifest the endeavor to arrive at a comprehension of the world through a study of the equivalents between man and the universe; the sun, for instance, is compared to an eye, and the world is conceived as a gigantic being whose sacrificial dismemberment gave rise to the universe. Furthermore, this being, or primordial man (Puruṣa), could obviously be none other than the Sacrifice itself (Prajāpati), since the sole truly valid sacrifice is that of self, which ensures a mystic renascence; no other victims can ever be anything more than substitutes. Hence the saying, "With the sacrifice, the gods sacrificed the Sacrifice." The thorough understanding of the tendency to establish magic equivalents among the different planes of the cosmos is doubtless the primary requisite for gaining an intimate insight into Hindu art; this tendency reached its climax in the Upanishads, texts which, canonically presented as an appendix to the Brāhmaṇas, formed the conclusion of the Vedas, the *Vedānta* (*Veda-anta*). Inquiring into the true nature of man and the world, and pursuing experimental, analogical scientific investigation begun in the preceding period, the authors of the Upanishads associate the pneumatic physics of wind with the pneumatic physiology of breathing; simultaneously, however, they advanced from this empirical and pseudo-scientific knowledge of the world to a radically different plane of knowledge, which has nothing in common with the former and is of an ontological order. Knowledge (Skr., *vēda*) is replaced by gnosis (Skr., *jñāna*), and revelation by direct experience of the absolute, or, in the words of the Upanishads, of the fullness (Skr., *pūrṇa*); curiosity about the creation is paralleled by an impatience with reality, and a supreme equivalent, mystically apprehended, transcends all others: the identity of the supreme reality of the universe, the *brahman*, and the most intimate reality of man, the *ātman*. Consequently (and this is, perhaps, the most powerfully original element in Hinduism as a religion), the world as it may be apprehended by the senses (the Indians regard intellect, manas, as one of the senses) is violently sucked up by the absolute.

These same upanishadic texts combine the complementary notions of samsara and Karma, of transmigration and retribution, in such a way that every human existence assumes the aspect of a link in a long chain of servitude; yet this interminable wandering across an ocean of existences is, after all, but relative. Thus, to the two orders of knowledge (exoteric and esoteric) correspond two planes of existence: that of the man subject to Karma even though he be a Brahman, and that of the liberated, living man (Skr., *jīvanmukta*) who is no longer sullied by the cosmic error: the bonds of an illusory causality are broken for him who has — directly and mystically — experienced the supreme liberty of the atman. This superior mode of existence, this transcendent life, which direct contact with the supreme reality reveals, is the end to which every Indian aspires; for the Hindu concept of moksha, release, differs but little from either the Jain or Buddhist concept of nirvana. Hence the tenacious spiritual struggle to overcome — or to consummate — the human condition, which became manifest not only in Hinduism, but also in both Buddhism and Jainism, and which has constantly occupied the Indian yogi. The patient practice of techniques of meditation, the striving to reach states of ecstasy with the help of methods that originated in a far-off prehistory, and all the psychophysiological asceticism aimed at mastering the vital rhythms that must have gone on from this remote epoch can be imagined. A strenuous effort to transcend the natural course of existence came to second the pursuit, beyond the illusion of the senses and the intellect, of a metempiric, intuitive, and analytic knowledge of the absolute.

Cosmology, Yoga, metensomatosis, belief in divine incarnations or in "great predestined beings" (Buddha, Jina, and Vāsudeva Kṛṣṇa) — these infinitely rich and varied currents of ancient religion intermingled and, rising up from the depths of India as from the ocean, they floated on the surface of the texts as plankton floats upon the seas; from this beginning, Hinduism developed into maturity through the centuries. The imposing figures of divine personalities, whose Vedic names were but a pretext, began to multiply prodigiously, to the point of reducing the Vedic pantheon to the dimension of a puppet theatre by comparison. This religious renewal took place within the various sects, which had developed a fervent devotional piety (bhakti) that led in turn to a form of idolatry as its direct corollary, for devotion requires a concrete object on which to discharge itself. Thus, the ancient ritual, though not entirely abandoned, was replaced by new forms of devotional service (puja). In a later Upanishad (*Śvetāśvatara Upaniṣad*), Rudra the Howler, the Vedic god of storms, appears in the lofty role of a genuine personification of the *brahman* and a master of Yoga: a sovereign and immortal deity, at once immanent and transcendent, the ultimate reality beyond which there is nothing but the undifferentiation of the absolute. He is the Benevolent One (Śiva), the male element or spirit (*puruṣa*), the Lord (bhagavat) implored by his worshipers (*śivabhāgavata*, as they were called by Patañjali, a grammarian of the 2d century B.C.), an alarming, often terrible, and alternately orgiastic or ascetic figure, whose spouse Umā appears in the *Kena Upaniṣad* as the initiatrix of the gods. A very different figure is Vāsudeva, whom his worshipers, the Bhagavatas, recognize as the god of gods, and whom the Greek Heliodorus also caused to be represented as such on the column at Besnagar, the oldest monument of sectarian Hinduism. Vāsudeva is a legendary rather than a mythical figure; his devotees preserve the memory of his human existence and his descendance from the historical Vṛṣṇi clan, and the difference between this great being, manifestation of the unique, and other great beings who attained supreme knowledge, such as the Buddha or Jina, is but relative. This Indian propensity toward deifying human beings, examples of which abound throughout India's history, is particularly apparent in the worship of Viṣṇu in the Vaishnava doctrine of the avatars, or descents of the divinity, which are the instruments of divine action on the world. The personality of Viṣṇu is itself the product of an assimilation of various different divinities: Viṣṇu the solar god who, in the Vedas, traversed the three regions of space in three strides and who, in the Brāhmaṇas, is occasionally identified with the sacrifice; Vāsudeva Kṛṣṇa; another Kṛṣṇa, the pastoral god of the Mathura region, who may himself be merely one of the aspects of a youthful god worshiped on the mountain peaks and from whom Śiva, the Tamil Murugan, Skanda Kumāra, and even the Bodhisattva Avalokiteśvara (who dwells on Mount Potala) have inherited certain traits (A. Foucher, *La vieille route de l'Inde*, 2 vols., Paris, 1942–47); and finally Nara Nārāyaṇa, lord of the primordial waters — and these are only the most important of the divinities that compose Viṣṇu's personality.

All this religious effervescence was paralleled by speculative searching, which is manifest not only in the later Upanishads but also in two great epic poems, of Vaishnava tendencies, the *Rāmāyaṇa* and the *Mahābhārata*, episodes of which are often represented in the temple carvings; an episode of the latter, the *Bhagavad Gītā* ("Song of the Lord"), constitutes a fundamental text of Hinduism; signs of this search may even have occurred in the earlier Purāṇas. This speculative inquiry, which later was rationalized, was expressed somewhat confusedly at first. Nevertheless, two different attitudes are readily distinguishable, attitudes which, though later to become contradictory, initially formed two perspectives of reality — the Sankhya and the *Vedānta*. The Sankhya attitude centers upon the created world; in its purest form, it recognizes no god or supreme lord. It acknowledges the action of the spirit on the world but regards the spirit as quite distinct from matter, which the spirit cannot produce and which, like the spirit, is eternal. The first cause of the nonspiritual world, which also constitutes its substance, is known as Prakṛti (she who produces, the fashioner), who is fecundated by the spirit, known as Puruṣa (the male). Thus, just as some mythology conceives of the world as the issue of a primordial couple, so the Sankhya sees it as the union of two principles. The spirit is by definition without quality (*nirguṇa*), but the *prakṛti* consists of three qualities (*guṇas*) blended in varying proportions: the sattva, luminous and pure; the rajas, active and passional; and the tamas, dark and ponderous. As for individual souls, the Sankhya merely notes their plurality. The eternal monads, each one of which is identical to itself and similar to the others, can be bound by ties (*guṇas*) to the *prakṛti* but are capable of regaining their liberty. Parallel to this endeavor to comprehend the world, the *Vedānta* offers a meditation on the human being based on the upanishadic gnosis. The *Vedānta* presents itself as a perception of a higher order, beside which, from the point of view of the unique reality, all knowledge (vidya), since it is illusory and fallacious, is nescience (avidya). The *Vedānta* tends throughout toward a more or less intransigent monism, which it was nevertheless obliged to compromise. Since the *Vedānta* recognizes the unique being of the one, the supreme atman, the *Paramātman*, as an axiom, it is usually obliged to deny to the world and its multiple beings any more than a relative degree of existence; maya, or creative energy, thus appeared suspect, and the term (possibly because of the influence of some aspect of Buddhism) often came to denote a sort of deception, to which the senses fall prey and which hides reality from them, a universal illusion promoted to the rank of a cosmic process.

By the Gupta period (4th–6th cent. of the Christian era), during which Indian civilization reached its apogee and Hindu art as it is now known developed, the major trends of Hinduism had crystallized. Its subsequent evolution was to consist in the development of certain already incipient tendencies, in an ever-increasing dispersal, and in a systematization that is a characteristic of the Brahmanic spirit.

One of the most prominent features of medieval Hinduism was its sectarian dispersal. In addition to the partitioning of society into castes, which grew steadily more complicated and rigid, came a parcelling into sects, which went counter to the castes; for the sect developed from a different basis and, generally speaking, ignores the caste. It should be noted that the term "sect" here refers not only to the larger sectarian groupings, such as Vaishnavism, Saivism (worship of Śiva), and Shaktism, but also to their subdivisions, which alone constitute social entities: the Bhagavatas, Pāñcarātras, Śrīvaiṣṇavas, Paśupatas, Kāpālikas, Lingayats, and Saiva Siddhantas. Although it is connected with Saivism, Shaktism constitutes something

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

of an exception among the sects, for it involves worship of the deity's creative energy, his *śakti*, which is conceived as female and personified in the goddess Kālī.

During this same period Hindu literature became enriched with new texts, the Purāṇas and the Tantras. The Purāṇas (books on ancient lore) themselves were edited in their present form during the medieval period, while the most recent among them were not completed before 1200, although the name had existed for centuries. The Purāṇas are vast compilations, in which cosmogony, genealogy, and myths are mingled with writing on ritual and even with the rudiments of secular learning. The fundamental texts of the different sects are collectively designated as Tantras, a term which, in its broadest sense, refers both to the Saiva Āgamas and the Vaishnava Samhitas, works of considerable importance, which continue the Purāṇas and embody many preexisting religious elements. However, the Tantras properly so called (that is, in the narrowest sense of this term) are works reserved for the initiated and profoundly marked by a preoccupation with magic; in addition to practices enlarging the elements of Yoga by adding all the resources of physiology and, in particular, that of sexuality, they describe ceremonies, frequently performed at night, in the crematory fields. These Āgamas and Tantras, which abound in particulars of the ritual, the temples, and the cult images, are invaluable for the study of art and ritual, but the information they provide should be applied very warily to earlier works of art for which the support of contemporary doctrinal texts is lacking. Fortunately, Tantrism developed and codified traditions frequently alluded to in earlier texts.

A study of Hindu iconography, while revealing the popular and mythological aspect of Hinduism, would give rise to the impression that India was fundamentally polytheistic and idolatrous. But a more fitting description than polytheism is polymorphism of the divine. Hinduism is endowed with a sense of the proliferation of the divine as a manifestation of the maya. Hence the tendency to pluralize the aspects and powers of the divine in a fragmentation of the divine substance; the attributes with which every sacred image is endowed were multiplied, and gods were imagined with thousands of heads and arms. Divinity is often symbolized by anatomical monstrosities, of which artists have managed to make esthetically valid figures. This striving for expressiveness is aided by a large number of conventions: attributes, gestures (mudras), attitudes (PL. 227), dress. Not only are the gods legion, but the representations of one and the same god are multiplied at will; with Viṣṇu, for instance, one has merely to change the order of the emblems held in his four hands, to obtain 24 different aspects of him, all duly catalogued. Paralleling this pluralistic tendency, however, as though in reaction to it, Hinduism manifested an aspiration toward the unique or indefinable. The two tendencies are summed up in the doctrine of the avatars, in which the avatar is seen as the most current and most immanent phenomenon in everyday experience; partial avatars, more or less rich in divine essence, are also recognized. This divine essence is of the very substance of Viṣṇu. Thus, there also existed a disposition to recombine the divine, which gave rise to numerous syncretisms and found artistic expression in the creation of composite types: the Trimūrti, or trinity (uniting Viṣṇu and Brahmā with Śiva), and Harihara (half Viṣṇu, half Śiva). The manifold aspects of Śiva, though duly acknowledged, are recombined in Śiva Ardhanārīśvara, whose left half is Kālī, or in the three-headed Maheśamūrti, the most celebrated example of which is at Elephanta.

Last but most sacred of all the images of Śiva is that which is placed in the sanctuary and which is simply called the "linga," a term meaning "mark" or "sign." Although the linga is merely a phallic symbol, sometimes adorned with Śiva's features (*mukhaliṅga*; PL. 476), it is completely devoid of lewdness (PL. 232); on the contrary, the faithful are well aware that the linga transcends iconolatry. It was by persisting in such abstraction that India, which has never retreated from the extreme consequence, drove her religious art to its own annihilation: the faithful flock to the temple in southern Chidambaram to worship an invisible linga of space (*ākāśaliṅga*).

IMAGE AND CULT. The images of the gods, which play an important role in the everyday life of India, are essentially cult images. They serve in the puja, which has become the basic rite of Hinduism with acts of homage paid to the image by the worshipers or the priests, who present it with food, drink, perfumes, and flowers; light lamps in front of it; and from time to time, wash, dress, and adorn it. On rarer occasions the image is paraded on a triumphal car (ratha) or even taken to bathe in a sacred pool or river, in ceremonies that are enlivened by the performance of popular mysteries (see DEVOTIONAL OBJECTS AND IMAGES). This cult of images, which is not of Vedic origin, is first mentioned in the texts dating from about 400 B.C.; the *Adbhūta Brāhmaṇa*, the Gṛhyasūtras, and the Dharmasūtras allude to both images and temples.

However, such idolatry, or seeming idolatry, was not universally accepted, and certain Brahmans, the Śrautas, continued to abide by the Vedic tradition. Other theologians, endeavoring to justify the cult of images, argued that humanity in the modern age (the *Kāliyūga*, or dark age), is so profoundly immersed in the material as to be incapable of rising spontaneously to a purely spiritual form of worship and is obliged to have recourse to this same material reality even to rid its spirit of the impure alloy that binds it to earth. Even the godhead himself, as they also pointed out, does not disdain to manifest himself in the realm of maya, in order that he may become accessible to the material consciousness.

Generally speaking, the image of the divinity is regarded as being merely an instrument to promote the worshiper's spiritual life. It is in no way an object of worship, but merely an accessory of the cult, and the cult is a means to arrive at a spiritual end. The texts are at pains to make it quite clear that the puja is exclusively a mental act which accompanies the ritual. A text quoted by Giuseppe Tucci (1949), for example, explains that the flowers offered to the linga represent virtues. This same idea is developed in the Tantras, but the principle has far more ancient origins: in the earliest Upanishads, the oblation to fire (*agnīhotra*) had already been commuted to a mental rite. The Tantras amplify and define ritual techniques which differ only superficially from those of an earlier period. The image is defined as merely a manifested sign of the unknowable, before which the worshiper gives himself up to a meditation, whose stages are described in the texts and taught to the pupil by the guru (master). This meditation admits of psychological nuances. Like a lover whose gaze lingers caressingly on the body of his beloved, the bhakta (worshiper) rapturously pores over every detail of the image, seeking, as he gazes, to transcend his analytical contemplation in order to arrive at a total perception (much harder to evoke and preserve), which he finally abstracts, sinking himself in a sea of love.

Other texts describe the succeeding stages of the discipline called Yoga: concentration on a fixed point, sustained attention, and then mental contemplation which produces an inner vision. Finally, all distinction between subject and object is eliminated and the contents of one's consciousness become identified with the inner vision. In short, meditation before the image of the divinity, practiced in accordance with a ritual that varies from sect to sect, belongs in the category of methods directed toward eliminating the distinction between the self and the others in order to destroy the illusion of duality. It is evident that the image most appropriate to this process of approach to reality, through the veil of the maya, is that of the *śakti*, or divine creative energy, since the world — that is, the maya — is itself a display of creative energy. But the puja may be applied to any divinity or aspect of a divinity. Thus, in some ways, the image of a divine being is merely an aid to a spiritual exercise — not an object of devotion, but an accessory of devotion, an instrument, or, to use the Sanskrit term, a *yantra*. To the same end, the Hindus similarly worship the guru or a woman whose nature presents mysterious affinities with that of the *śakti*. Another kind of yantra used is of a purely geometrical order, consisting essentially in a figure composed of polygons, circles, and lotus blooms with stylized lanceolate petals. This yantra is a mere diagram, occasionally enlivened with a few Sanskrit characters and endowed by the worshiper, as his

gaze travels over it, with a spiritual content codified by the texts and learned from the guru.

In effect, the linear yantra, the temple, and in some cases, the statuary yantra are objects designed to be mentally or physically traversed from the periphery toward the center, the state of divine exaltation steadily augmenting as the center is approached. With the most celebrated linear yantra, the *śrīyantra*, the worshiper starts in spirit from the outer zone, traverses three circles and three squares, and, after having passed through zones of sixteen and eight petals, penetrates to an inner area of interlaced equilateral triangles enclosing the undifferentiated absolute, the *Paramātman*. It is essential that a yantra be just as rigorously accurate as a formula or a technical design, a necessity which renders it equally difficult of comprehension. In certain Tantras the image has become a cryptogram which only the initiated are able to decipher. Tucci mentions an image of the *śakti* holding a bow in the lower left hand and five floral arrows in the upper, a cord in the lower right hand and a hook in the upper. These attributes symbolize, respectively, the spirit, matter in the form of the five elements, the passions, and anger; in addition, each attribute is associated with a mystic syllable (mantra): *tham*, *hum*, and so on.

Such conventions are customary only in the Tantras. Generally speaking, the image is a provisional means of attaining union with the deity in one of his manifestations. In principle, worship of the divinity is not possible except through identification with the divine, as is attested by various adages: *nādevo devam arcayet*, "no one who is not himself divine may (successfully) worship the divinity"; *devam bhūtva devam yajet*, "having become the deity, one should offer sacrifice to it." Accordingly, puja should transcend the phases of a ritual or an intellectual meditation to become a true spiritual experience. The method followed by the worshiper is the reverse of that of the artist, for the techniques of creating and utilizing a religious image together make up a perfect symmetry; the expression "second creation," frequently used to denote the process of assimilation of an image into the consciousness of the contemplative, here applies in its most literal sense.

A number of relatively late treatises establish and minutely define the extremely strict rules to which the painter or sculptor is obliged to conform, and these might lead to the assumption that the Hindu artist is a mere executant, deprived of all creative freedom. Indeed, the Indians regard the treatises (shastras) as the expression of a preestablished norm that is one of the manifestations of the universal order. This universal order was earlier known to Vedism as *ṛta* and is more or less the same concept as that suggested by the word "Dharma," which refers not only to the social and moral order of the universe but to its physical order as well. Dharma, one of the most important words in Indian civilization, comes from a root meaning "to support," or "to sustain" (Lat., *firmus*). Dharma constitutes the permanent support of the universe, of which the social and political order (a reflection in human behavior of the universal harmony) is an aspect. Thus, if the social order is disturbed, the atmospheric equilibrium and the normal alternation of the seasons are likely to be involved in the disturbance. The king, as the defender of the Dharma, is responsible not only for the morals of his subjects but also for the fertility of the soil and the fecundity of the cattle — a political aspect of the Dharma that, as will be seen, considerably influenced symbolism in architecture. Attempts had been made, even before the appearance of the Upanishads, to define the cosmic organization by establishing points of correspondence between the world of man and the world of the gods, between microcosm and macrocosm, points of correspondence which these texts, concealing a wealth of innovatory audacity behind traditional modes of thought, multiplied in an effort to obtain a deeper insight into the cosmic mystery.

Under such circumstances it is obvious that man in his creative activity cannot presume to anarchic liberty. All creative activity is regulated by clearly defined traditional rules, handed on from master to pupil. All religious art must conform to the treatises, for fear of being as sacrilegious and as scandalous as would be a man of low caste who presumed to recite the Vedas and as dangerous as a sacrifice not performed in accordance with the ritual. The artist's freedom is curtailed by a rigid code of conventions, which guarantees the harmonization of a work of art with the universal order; yet this constraint, far from prejudicing the affirmation of his personality, renders it more complex, more self-critical, and ultimately, more brilliant.

The universal harmony is considered to be subject to the law of numbers; the word "maya" itself, which had originally designated the illusionistic power of the old cosmic deity Varuṇa, and which later came to signify the universal illusion, is connected with the root *mā*, meaning "to measure" (the same root from which several Indo-European languages derived their word for month and for the moon, whose phases mark the course of time). The maya is the "measurer," who engenders time and space. The creative magic is part of a gigantic geometrical and chronological scheme, and the visible world is characterized by the fact that it pertains to the measurable. These concepts led to the establishment of a rigorous system of proportions, called *pramāṇa*, a term also derived from the root *mā*. Designating not only the true criteria of knowledge but also the correct method of executing a statue, *pramāṇa* is one of the series of terms which most clearly reveal Brahmanic and scholastic India's interest in the norm rather than in the diversity of reality. Although the rules for religious art were doubtless not always so restrictive as some of the later treatises would lead one to suppose, the medieval period witnessed the compilation of catalogues of measurements, which effectively eliminated every last inaccuracy of detail; these catalogues, moreover, assign particular importance to certain so-called "privileged" numbers (especially the number 108), despite the fact that these numbers bear no relation whatever to esthetics: the ideal height for the figure of a divinity, for instance, is given as 108 times the width of the thumb. Thus, the first requisite demanded of the image of a divinity is that it be correct, or in conformity with the treatises (the meaning of the word *śāstrīya*). However, this is only the beginning: like the puja, the creation of an image is a religious exercise. Having purified himself, the artist prepares for his task by prayer and meditation, after which he withdraws within himself, creates a mental image in conformity with the shastras, and only when this hidden image has reached completion within him, only when all its details are present and immutable in his mind's eye, may he proceed to its material creation. Kashmirian Saivism expressly compares the artist's process of mental creation to the divine creation; Abhinavagupta, in order to explain how Śiva creates the world without any material aid, cites the painter, who conceives his image without canvas, paints, or paintbrushes.

After the image has taken material form, it is endowed with its power of suggestion through a rite of consecration, essentially an anointment, followed by a ceremony of so-called "awakening," or "opening of the eyes," and a first solemn puja. Finally, the worshiper, observing the same iconographic traditions as the artist, and with the help of the material image before him, must in his turn create a mental image, which, when projected onto the material image, constitutes the cult image properly so-called, for the mental image confers a higher reality on the material image. Thus the artist, the priest, and the worshiper successively endow the image with divinity, and it is to this threefold operation that the image owes its sacred character.

THE TEMPLE AND THE COSMOS. *Cosmology and the sacred edifice.* Both in its entirety and in its details, the Hindu temple is invested with a complex symbolism that has several corresponding, mutually allusive, and evocative aspects. This has been established through the efforts of numerous scholars — among whom E. B. Havell, Jean Przyluski, Ananda K. Coomaraswamy, Robert von Heine-Geldern, George Cœdès, Paul Mus, Giuseppe Tucci, and Stella Kramrisch deserve special mention. Research in this field, however, is still far from having provided either conclusive proof or complete clarification with regard to all the implications of this manifold correspondence. To begin with, this symbolism of the temple can readily be referred to its cosmic element: the temple represents the cosmos. But

CC-0. In Public Domain. UP State Museum, Hazratganj. Lucknow

it must be remembered that according to the Brāhmaṇas the cosmos is man (*puruṣa*); the Vedic hymn to Puruṣa explains that the social body is also man, and that Yoga superimposes a mystic pseudoanatomy on the physical anatomy.

The principal aspects of this symbolism are already present in the fire altar (*agnicayana*), the only type of monument the Vedists built, and it is in this altar, at the source, where the symbolism is still relatively simple, that the symbolic meanings should be studied. The altar, which took no less than a year to complete, was a simple terrace built of a fixed number of bricks, precisely 10,800. Like their Vedic predecessors, the Hindu masons attached great importance to the privileged status of certain numbers. The bricks were laid out according to a prescribed pattern to represent either a man or a falcon with spread wings, which in itself was identified with a man. The structure preserved the memory of a time when a human being had been sacrificed for the occasion, together with four animal victims; the heads of the five were walled into the altar and their bodies were thrown into the water used to prepare the clay. A human being had thus been incorporated into the altar in a sacrifice which mystically repeated the dismemberment of the primordial man. More precisely, the altar represented man himself reduced to an architectural diagram. The raising of the fire altar was a rite in which the sacrificer was identified at once with the victim and with the creature (man or beast) represented by the altar, while the victim himself was identified with the primordial man. Thus, the raising of the fire altar constituted the counterpart of the cosmic sacrifice, the reconstruction of Prajāpati, in short, a permanent complement of the creation.

The various meanings of the word *puruṣa*, which, in the Sankhya doctrines, signifies the spirit opposed to matter, may seem perplexing, but an ancient conceptual background, which can always be discerned, ensures the coherence of the symbolism despite the multiplicity of its aspects. The cosmos was born of a primordial couple (produced by a scission of the androgyne, who assumed male essence and engendered a female out of himself); the dualism of *puruṣa* and *prakṛti* offers a philosophical metamorphosis of this couple, Prajāpati and Vāc (the Word) in the Brahmanic interpretation. Even the Brāhmaṇas regard Prajāpati as the spirit: *mano hi Prajāpatiḥ*. The two senses of the word *puruṣa* (or Puruṣa) are not really contradictory; the cosmic giant is indeed the abstract framework of the universe, clothed in the changing variety of matter. All this is a translation of the ancient concept, widely held from Egypt to China, of the union of the earth and sky (P. Mus, G. Monod-Herzen).

Since the temple, like the fire altar, is conceived as representing the framework, or skeleton, of the cosmos, its architectural form is largely determined by this concept, although the symbolism investing it, a few aspects of which will be examined, applies essentially to the real (and implicit) temple (*sphoṭa*), of which the visible temple is but an approximate rendering. In the Vedic ritual the sacrificial post (*yūpa*) was regarded as representing the *axis mundi* and the pillar (stambha) as supporting the vault of the firmament; puranic cosmology pictured this gigantic support separating the earth and sky as a mountain (Mount Meru) in the form of a stepped pyramid flaring out in a bulbous or bell-shaped curve toward its apex. The earthly counterpart of Mount Meru is Mount Kailasa, dwelling place of Śiva, located in the north of India, at the center of the earth. There is no identification of the two mountains, but a close correspondence between them, which is inherent in the general pattern of organization of the Universe.

In India, as in Cambodia (q.v.), the temple is built in the likeness of Mount Meru (and therefore also of Mount Kailasa), a likeness which may remain merely implicit or may be more or less eloquently manifest in the actual appearance of the monument (see COSMOLOGY AND CARTOGRAPHY; ESCHATOLOGY). Although these concepts were popularized only by the medieval texts and the inscriptions of the Khmer culture of Cambodia, they date from a very early period. Testimony to their ancient origins is offered by occasional allusions in the texts, which are far too few, however, to allow a coherent study; the *Rāmāyaṇa* describes a temple as being "as magnificent as the peak of Mount Kailasa" (*Kailāsaśikharaprakhyam*). It was certainly as much the requirements of symbolism as the technical necessities of the corbeled vault that led the Hindus to cover the sanctuaries of their temples with steep roofs; in the nagara style, they were actually called shikaras (peaks) and in the interests of symbolism as well as for technical and esthetic reasons were built up in successive stories. Thus, while the sanctuaries at Ellora and Badami had been hollowed out of the mountain (IV, PL. 130), the rathas (temples) at Mamallapuram (Mahabalipuram) and the Kailāsanātha (Kailasa shrine) at Ellora, which were carved from the living rock as freestanding entities to represent the mountain itself, also bore decorations carved on the outside (IV, 254). The sanctuary, which later became a mountain built of bricks or stone, perhaps in the very beginning had been built of wood. Although constructed according to two different techniques, both the Kailāsanātha at Ellora and that at Kanchipuram are styled "similar to Mount Kailasa" (plaques of Vēlūrpalayam and Baroda). The temple of Śāluvarikuppam is even called "comparable to the Kailāsamandara"; Mount Mandara is the cosmic churn which caused creation to spring up from the Sea of Milk, image of the primordial waters, and this composite name testifies eloquently to the polyvalence of symbolism.

In southeastern Asia — especially in Cambodia and Champa — in Java, and even in modern Bali, the symbolism has been subject to corruption but also has been enriched and expanded with new concepts. In Cambodia, where the esoteric significance of the temples has been the object of particularly thorough study, the architect endeavored, if not to render the cosmos in detail, at least to evoke new and more complex aspects of it. The entire city of Angkor Thom, as restored by the Buddhist ruler Jayavarman VII at the close of the 12th century, is a reproduction of the cosmos; the temple, which represents the Central Mount, is surrounded, as in the cosmos, by an outer wall, this latter in turn surrounded by moats symbolizing the peripheral ocean. It is of little consequence that the central temple, the Bayon, happens to be Buddhist (VIII, PL. 372); the concept of the function of architecture remains the same. Moreover, the architectural program in Cambodia, to an even greater extent than in India, constituted an indispensable instrument of political power; to say that the temple-mountain was intended as a replica of the cosmic mountain, or the *axis mundi*, would not represent the whole of its significance; in accordance with the tantrist ritual set up by the Brahman Sadāsiva, the Mahendraparvata (the mountain on which Jayavarman II, the universal monarch, built his capital in the 9th century) was mystically identified with Mount Meru. It was with the founding of the temple in which this ritual was performed and which, as it were, epitomized the capital that this prince "returned from Java" (where he had doubtless been held as hostage) and liberated Cambodia from the domination of the Śailendra dynasty, that is, from the "Indras of the mountain" (gods who exercised their authority from the summit). Indeed, as the king, who was Indra among men, constituted the apex, or center, of humanity and was in direct communication with the gods, so the urban and royal temple constituted the *umbilicus mundi*, the center of the universal kingdom.

This recalls the close affinity of certain Indian and Mesopotamian concepts, which Jean Przyluski pointed out in connection with the city of the universal monarch. As Heine-Geldern observed, man fashioned his kingdom, his capital, his palace, his temple in the likeness of the cosmological edifice and in harmony with the magic relation between the human world and the universe; in this relation colors, stones, and metals and all the events of life are assigned to the various constellations and regions of space which determine destiny, and all have their appointed magic place in the universal edifice and their magic time in association with the movements of the planets.

This affinity would be called to mind even without the curious morphological resemblance between temple-mountain and ziggurat. The terraced structure representing Mount Kailasa on a pediment of the Khmer temple at Banteay Srei (967) is precisely that which the Purāṇas assign, inverted, to Mount Meru and which the Buddhists had already given to the complex inverted parasol (II, PL. 404) that surmounted the dome

(*aṇḍa*, meaning literally "egg") of their early stupas. This obviously does not mean that the Khmer temple-mountain was in any way, shape, or manner copied from the ziggurat. However, the temple-mountain originated in concepts which, though Buddhist, were not without traces of Babylonian influence, and which found architectural expression in rather an unusual type of monument: the multistoried stupa, the most celebrated example of which was the gigantic stupa built by Kaniṣka at Peshawar and known from the descriptions of Chinese pilgrims. In this case, it is perhaps conceivable that the architect employed by this central Asian monarch might well have derived his inspiration from one of those impressive Babylonian ruins past which caravans for Mesopotamia had journeyed since the time of the *Bāveru* (or *Bāb-ilu*) *Jātaka*, and in which he might perhaps have recognized the expression of concepts familiar to him.

*Dynamics of the temple.* The Babylonians held that the planetary stories of the cosmos were paralleled, if not by spiritual degrees, at least by supraterrestrial levels of existence; India, with her passionate aspiration toward a progressive transcendence of the human condition, expanded this symbolism. In the representation of Mount Kailasa at Banteay Srei, the hierarchy of the different beings who people the various stories of the mountain is very clearly shown; the top story, immediately below Śiva's abode, is occupied by saintly ascetics. Nevertheless, a static diagram of the temple would in fact be far from complete; Hinduism, with its passion for pilgrimages, conceives the attainment of spiritual perfection as a long journey of many stages. In both Hinduism and Buddhism spiritual progress and even transmigration are at times regarded as a slow forward movement. Likewise, the temple is conceived as a place of transit, or, as in Sanskrit (though with a different application), a *tīrtha*, a word meaning primarily "ford," then "sacred bath," and lastly "place of pilgrimage" in general. The guardian divinities are sometimes referred to as "ferrymen," *tāras*, a word drawn from the same root. The Buddhist version of this concept is perhaps most eloquently expressed in the Neak Pean (VIII, PL. 374) in Cambodia; the whole symbolism in the carving on the doors of Buddhist temples (which can only be mentioned here) is connected with this idea (an arch representing the rainbow, or bridge between the earth and sky; *makaras*, or fantastic marine monsters; fluvial divinities; etc.).

The most elemental aspect of this devotional dynamism, practiced in honor of a sacred person or object, is the *pradakṣiṇā*, or circumambulation, which consists in proceeding clockwise around a guru, a statue, a temple, or even an entire river, such as the Ganges. The *pradakṣiṇā*, in the same way as the mudras, is a rite constituting a corporeal participation in prayer; in some cases it was translated into architecture and an ambulatory, the *pradakṣiṇāpatha*, was provided. It is this element which gives the Durgā temple at Aihole (I, PL. 220) the basilical plan — exceptional among Hindu temples — of the Buddhist chaityas. In Cambodia the *pradakṣiṇā* inspired the creation of the continuous gallery that bounds the terraces of the temple-mountain; at Angkor Wat the decoration in the galleries shows that there the circumambulation was performed in the direction opposite to that normally followed; from this scholars have been able to deduce that this temple had a funerary character. In many of the Saiva temples of northern India, the southern façade is dedicated to Viṣṇu, the western to Śiva, and the northern to Brahmā; the *pradakṣiṇā* thus brings the worshiper successively face to face with three aspects of the divine, personified in the members of the Trimūrti, and subsequently takes him on round to the eastern façade, to face the door through which he may perceive, within the sanctuary, the unique reality — the linga, symbol of the Unique One. Likewise, the shikara symbolizes the cosmic pillar, the gigantic linga which Brahmā in the form of a swan could not fly over, and which Viṣṇu in the form of a boar failed to uproot with his snout, but which opens to reveal the Lord, who is potentially manifest within its hermetic perfection. In the vast complexes of the temples of southern India, the worshiper proceeds through the mazes of a highly intricate symbolism which culminates in the sanctuary, the center and mystic summit of the whole architectural complex. For the center (as has been clearly demonstrated — by Mircea Eliade in particular) is identified with the summit. The true progression, such as that which took the Babylonian priest up to the top of the ziggurat, into the presence of his god (*Bā-ilu*, "door of God"), is that which moves upward. In the Dharmarāja Rathe, a temple at Mamallapuram where there is enough room to circulate behind the miniature structures adorning the superstructure and a stairway leads from the second to the third story so that circumambulation could be internally performed, the sanctuary is located literally in the center and at the summit of the temple, in a small niche carved out on the third story, which — and this is a significant detail — marks a transition from a square to a circular plan. However, it is not known whether the worshiper was normally allowed to enter this sanctuary or whether, as Jouveau Dubreuil supposes, there was also a stairway going from the first (ground) floor up to the second floor. There is room for doubt on both scores, since the hiatus between the profane and the sacred world would appear to be an element of the symbolism attaching to this temple. The true *pradakṣiṇā* is that which is performed in the mind; from this point of view, the difference between the Dharmarāja Ratha and the later temples fades, as the distance between the Indian and the Khmer temple, or even between temple and *yantra*, decreases. In a *yantra*, too, the essential point is the center, which, representing, as it were, the apex of the universe, the projection of the absolute, is called *bindu*, a word meaning "drop" or "dot," as well as "zero" (and, in the Tantra, "sperm").

*The temple and time.* The temple is intended essentially to serve as a reminder of transcendence, the idea of which, since it denotes a surmounting, contains an implicit reference to the relative. Inversely, the realization of the illusory nature of creation leads to a perception of the absolute; this is why the *śakti*, or creative power (an illusionistic power), is identified with the saving mercy of the deity. Now, the supreme revealer of the maya is time: time carries off all that assumes the appearance of reality; time, the great conjuror, animates the kaleidoscope of appearances; the very name of Kālī, who is both *śakti* and maya, points with an obvious play on words at the Sanskrit word of time, *kāla*; the epithet "Mahākāla" (which may mean either "Eternity" or "Destroyer") is applied, at once logically and paradoxically, to Śiva.

The Indians have always been fascinated by time and large numbers. The Indian genius which conceived the positional value of numbers (thereby inventing the zero, *bindu*, key to this notation) also devised the repetition on different scales of the same temporal cycles; the days and years of man, the days and years of Indra, and the days and years of Brahmā form overlapping sets of cycles. Further, the pulsations of the cosmos suggested transmigration, and it is here that the Indian concept of time ceased to be the speculation of philosophic astronomers and, as Heinrich Zimmer and Mircea Eliade have stressed, time has a saving virtue. Nothing could more clearly illustrate this concept than a brief summary of a puranic episode (previously cited by these two scholars), which, in denouncing the vanity of architecture, emphasizes the illusion of time. Indra has asked the divine architect to build him a palace in keeping with his dignity as king of the gods; presently, however, Viṣṇu, who is lord of the maya, visited him in the form of a ragged young urchin and proceeded to explain to him the mysteries of the creations and destructions of the universe; the life of an Indra is only 306,720,000 human years long, and that of a Brahmā lasts only 1,103,760 times longer. Whereupon, noticing an enormous column of ants, the boy burst out laughing; all these ants were reincarnations of former Indras. Another episode relates how Narada, to whom Viṣṇu had revealed the maya, lived within the space of a few moments (the time required to draw some water from a pool) an entire human destiny, which combined events of the deepest tragedy with hours of great happiness.

It was this spirit with its taste for overlapping that motivated the decoration of the superstructure of the medieval temples. The roof of the Dravidian temple presents itself as the rep-

etition on two different scales of one and the same element, since it is decorated with small-scale replicas of itself (*pañcārams*, as the Tamil architects called them), in the same way that a divine year is made up of human years or a destiny comprises a multitude of destinies. Despite their very different outward appearance, the temples of the type called "Nagara" were built according to the same principles; the shikara also comprises several stories, on each of which the same elements are repeated: tiers of decorative horseshoe apertures (*kūḍus*), each tier topped by a lotiform melon-shaped member (amalaka); a single amalaka used as a crowning member epitomizes the whole structure (PL. 230). For greater eloquence, the central shikara is sometimes encircled, as though besieged, by a host of smaller shikaras.

Research in this field has not yet progressed far enough for full discussion of the symbolism; however, the temple is the symbolic continuation of the fire altar, which was, in the poetic expression of Paul Mus, "time-constructed" (e.g., with groupings of 360 bricks suggesting the 360 days of the Indian year). The idea is constantly reiterated; "Agni is the year"; "this fire altar is Prajāpati and Prajāpati is the year," that is, time. Also, such passages in the Brāhmanas as "Prajāpati is the year" and "the year is death," with the cyclic concept of the parallelism between rebirth and the return of the year (also including that of the cosmic phases) must assume a saving value in Indian eyes. Since in the temples the very principle of the tiered arrangement — as in the superstructure — suggests the alternation of the seasons, it would be very surprising if the temple were not likewise "time-constructed." Be that as it may, there is no doubt that the vase (*kalaśa*) constituting the inaccessible finial of the sanctuary symbolizes the *bindu* (the absolute), the *akāla*, (the "timeless"), the bubble at the apex of being which bursts into nonbeing; the obvious allusion is to release (moksha) — which is cessation of transmigration (that is, of subjective time) — and to the superior lotus (of the Yoga pseudoanatomy) located at the apex of the skull — the lotus whose flowering leads the way into undifferentiation.

ESTHETICS AND SPIRITUALITY. Hinduism regards a work of art as an indispensable but transitory intermediary in a purely spiritual experience — a modest connective between the dualistic world, from which the worshiper sets out and to which the artist descends, and the unitary world to which the former rises and from which the latter returns. This attitude raises the question of the role, in this process, of the purely esthetic qualities of a work of art; in other words, it poses the question of whether inner, spiritual vision is susceptible of esthetic qualities and, if so, how much of this spiritual or ideal beauty is reflected in the material work of art. What is the essential artistic value of creations that, it would seem, are only incidentally viewed as works of art? What spiritual value, if any, does Hinduism attach to the esthetic experience?

Undeniably, the answers to such questions have varied widely over the centuries. Despite the variant responses, however, it would be a grave error of omission to stress the rigid codification of Hindu religious art and neglect entirely its independent esthetic values. That Indians are intensely aware of beauty and art is proved by the interest of Indian scholars in problems of esthetics. A distinct concept of beauty, however, is in a sense superfluous, since that of Dharma suffices; the harmonization of a work of art with the universal order is regarded as ultimate perfection. Dharma governs all creative activity, from that of the architect to that of the simple craftsman, giving religious as well as artistic significance to even the most humble endeavor; thus the attention to beauty manifest in the minor arts is prompted by religious considerations. Accordingly, the Sanskrit vocabulary, otherwise so rich in words expressing the infinite nuances of charm (*rūpavan*, "of beautiful forms," εὔμορφος; *saundara*, "graceful"; *ramya*, "charming"), has no word corresponding to the Greek καλός ("beautiful"), with that tinge of speculation with which Plato, for example, endows it. To postulate, as some commentators have been inclined to do, that Indians have been unconscious of or have discounted the concept of beauty would be grossly to misapprehend the spirit of Indian art. On the contrary, Indians have been deeply aware of the power of art; indeed, both the Buddhists and the Jains have at times seen fit to take a dim view of so potent a source of captivation. Yet such scruples, expressed in the disciplinary texts (*Cullavagga*, VI, 3), did not impede the magnificent flowering of early Buddhist art.

In the 2d century the great Buddhist thinker and poet Aśvaghoṣa still felt obliged to make some apology for having given a poetic rendering of the master's teachings: just as, with the addition of a little honey, a salutary but bitter medicine can be made delectable without losing its efficacy, so the art of the poet can render the master's words appealing, even to him who has not the necessary spiritual preparation to appreciate their pristine austerity. The very title that Aśvaghoṣa gave his work — *Sūtrālaṅkāra* ("The Adornment of the Sūtras") — is significant, for it furnishes the first approximately dated mention of *alaṅkāra*, a word that embodies a major concept of Indian art. Notwithstanding the felicitous solutions that one cannot fail to recognize in its creative works after even the most cursory study, the Indian esthetic directed Indian art into a course that, although very different from the one into which the Greeks were finally diverted, was in the end as circumscribed and futile, as hard to escape. Noting that art could enhance nature, Indian artists tended to confuse beauty with pure embellishment.

Another Buddhist, the idealist Asaṅga who lived a few centuries later (early 5th cent.?), advanced well beyond his coreligionist Aśvaghoṣa. In the *Mahāyānasūtrālaṅkāra* Asaṅga explained that the sight of the reflection of an object in a mirror could rouse a specific pleasure quite independent of the utility of the object itself. Thus, he elicited the concept of beauty in attempting to define esthetic pleasure.

Art — the present remarks concern nonreligious art — is dependent upon the doctrine of pleasure (*kāmaśāstra*). Adopting the Brahmanic jargon of the four incentives to human activity (the *caturvarga*), it may accordingly be said that the sight of an object which is designed for a particular use (artha) and which is in conformity with the Dharma can, if this same object has been fashioned by a skillful craftsman, induce an increase of pleasure (*kāma*); moreover, it was early discovered that this enjoyment could also be contributory to release (moksha).

According to Bhaṭṭanāyaka, an 8th-century esthetician, the contemplation of beauty brings about an inward illumination, due to the purity of the emotion experienced, or, in the Sankhya terms in which he set forth this idea: sattva (truth) prevails over rajas (restless activity) and tamas (ignorance), which, in contrast, prevail in the emotions excited by the ordinary sights of life. It is for this reason, as he goes on to explain, that the pictorial representation of a repugnant scene may very well engender esthetic enjoyment.

The emotions, or, more precisely, the affective flavors present in a work of art, which communicate themselves to the spectator's sensibility, are known in Indian rhetoric as rasas. The theory of rasa, like all Indian esthetic theories, was formulated chiefly in connection with drama and poetry; nevertheless, the allusions in the treatises to sculpture and, particularly, to painting are sufficiently numerous for it to be possible to apply this theory to the visual arts without risk of misrepresenting the intentions of their creators. The perception of rasas can be beneficial to the worshiper's spiritual life. According to the Kashmirian philosopher Abhinavagupta, perception of the rasa not only purifies the "mirror of the spirit" and sharpens the power of sympathy but also enables the *saḥṛdaya* ("he whose heart is with") to discover his own psyche, for that which becomes manifest to him in fact preexisted within him, in the form of latent potentialities built up in the course of his former existences. Enjoyment (*bhojakatava*), therefore, by awakening these latent powers, by stirring up a submerged and entirely unknown life which becomes visible to one's consciousness, destroys Karma. From a religious point of view, the most important of the rasas is that which — to use a paradox that appeals to Abhinavagupta — is characterized by the complete absence of rasa: the pacified rasa (*śāntarasa*) which induces serenity (*śama*). This is the rasa which, underlying all the other rasas, induces the intense bliss (ananda) that contact with any truly beautiful work of art

engenders (see ESTHETICS). The majestic composure inherent in the expression or pose of a sculptured or painted figure (e.g., the proud and tranquil bearing of the young Brahman carrying sacred water at Mamallapuram) is often evocative of the *śāntarasa*; the predominance of sattva even in certain representations marked by rajas — such as that of Rudra in the Maheśamūrti at Elephanta — recalls the fact that Abhinavagupta considers the hidden or manifest presence of the *śāntarasa* indispensable to every work of art. The status achieved by one who has freed his soul of passions and is in touch with an ineffable reality is the same as that which crowns the efforts of the yogi. The supreme yogi, the master of Yoga, spellbound in the sublime solitude of the unique one, is Śiva. Of all the representations of its kind in Hindu art, that at Mamallapuram most cogently expresses the tireless perseverance of the efforts of an introspectively meditating ascetic; he is *yukta*, or united, and concentrated in mystic unity, and he has forced that which is by nature movement — body, breath, psychomental flux — into immobility.

The myth which most eloquently illustrates the active value of this profound quietude is that of the dream of Viṣṇu: in the intervals between the Kalpas (cosmic cycles), Viṣṇu rests on the primordial waters, stretched out in sleep on the serpent Ananta (PL. 226). Heinrich Zimmer has dwelt at length on one aspect of this myth, namely, the illusion of time, which is symbolically rendered by the water, the magic element of transformation. Viṣṇu accumulates the cosmic energy from which creation springs; Brahmā is seated on a lotus bloom that has blossomed from Viṣṇu's navel. Once again, it is at Mamallapuram that the representation of this silent and eternal renewal of the world most in harmony with the spirit of medieval Hinduism can be found; the stiffness of the principal figure, carved with a somewhat awkward grandeur, and the disproportion between the divinity and the tiny worshipers lend the work a majesty that is not unworthy of the puranic gigantism. The sovereign power that can give life to repose and immobility, determining the triumph of active quiescence, could hardly be more convincingly expressed. A representation of the Gupta period, at Deogarh, is marked by entirely different qualities.

Although rhetoricians drew up lists of incompatibilities among the different rasas, one rasa is usually acknowledged to be omnipresent and to underlie all esthetic emotion; for Abhinavagupta, it is *śāntarasa*. If, however, a hitherto latent residue (*vāsanā*) is aroused by a suggestion (*vyañjana*) and comes to cloud the mirror of this perfect quietude, then various impressions immediately begin to shake the psyche and the *śāntarasa* becomes, as it were, colored and diversified. In the same way, disruption of the balance of the supreme consciousness, that is, of Śiva's conflicting but hitherto undifferentiated energies, sets in motion the creative process that is summed up in Śiva's dance; Viṣṇu dreams the world, Śiva dances it. The several variants of this dance, duly catalogued by the iconographers, did not appear simultaneously; Philippe Stern (1951), whose study advanced an original point of view, has shown how the timid movement (exemplified in what Stern calls "the first phase at Ellora") gained impetus until it reached a climax in the magnificent Dravidian figures — the outcome of development marked by continuous effort to preserve equilibrium in the face of ever-increasing dynamism. Even in the representations of Naṭarāja (Śiva as lord of the dance; PLS. 477, 488), the liveliest movement remains graceful and effortless and, with the most skillful balancing, the body retains its perfect verticality, despite the violence of its stance. The initial impression of stability, supreme indifference, and rigid discipline superimposed on tempestuous impulsion is celebrated and expounded in numerous Sanskrit and Tamil poems; representations such as these, in which each attribute has its own particular significance, are the sculptural expression of the Saiva concepts of the duality of Śiva, who is both creator and destroyer.

The energy of Śiva's dance reveals how medieval Hindu art is imbued with a sense of the dynamic gush of life, stimulated by the exuberance of the tropics. The dance symbolizes the same creative force elsewhere evoked by the pent-up potentialities of the linga, a force which is constantly erupting; for there is no question of the world's being created once and for all, or, to use an absurd mode of expression, of time's commencing in an instant of eternity; creative activity brooks no pause. Nevertheless, the dance takes the form of a completely spontaneous and joyfully performed sport; the demiurge manifests the ease of a professional tumbler. For the supreme magician, the lord of maya, the world is but a diversion (*līlā*). Despite its caprice, this spontaneous motion is essentially rhythmic, since it is dance: another confirmation of the existence, in this more or less illusory creation, of a universal order.

Even in his liveliest movements the divine dancer never loses his balance, nor does he ever allow himself to be carried away by his own frenzy; the discipline of the Supreme Yogi, which could hardly be less typical of Saivism, nevertheless marks the representations of the dancing Śiva. Śiva curbs and moderates his impetuosity for fear of destroying instantly that which he creates and of precipitating into the bosom of the indefectible unity the multiplicity which he engenders. Creation and destruction are two aspects, at most, two degrees of one and the same activity; joy and suffering are two faces of an identical reality: hence, Śiva's indifference and what might be called the amoralism of Saivism. In India there has always been a preoccupation with dualism, but there it was never conceived in terms of morality, as antagonism between good and evil (as it has been by others); so far as Hindus are concerned, good and evil alike proceed from the Divine. Thus Kālī is the mother whose love destroys her own offspring, as the Shakta poets proclaim, and her spouse is Mahākāla (Great Time, or Eternity), who swallows up all life. The world exists solely by virtue of a precarious balance between creation and destruction or, rather, of a moderation of the creative force. This apparent amoralism, however, has in itself a saving property, for a psychological aspect of the cosmic system is revealed. Holding the fire of destruction in one of his hands, the fire which burns bodies and which also consumes the hearts of those who love the Lord, destroying all illusion and ties, the Naṭarāja dances on a corpse: the corpse of the *apasmārapuruṣa*, the man who has gone astray. Śiva is also said to dance in the crematory field, and this cemetery, subjective center of the universe, common source of all passion and all destruction, is the human heart. Śiva in his fury unremittingly tramples on the illusion to which, despite the ever-present evidence of decrepitude and death, man so fiercely clings. Thus the worshiper, identifying himself with his god, dances on his own corpse. This delicate balance between the static and the dynamic (as opposed to another type of movement that is unrestrained, gesticulatory, and exaggerated) was the great esthetic achievement of the representations of the dancing Śiva and, indeed, was one of the triumphs of 7th-century Hindu art (of the period which Philippe Stern, in accordance with the chronological system he established, calls "the second phase at Ellora"). The supreme example may be that in the Cave of the Avatars at Ellora; the superb foreshortening in the complex curve of the torso, which captures the blasphemer's defiance and terror in the split second the one gives way to the other, represents not only a triumph of art but also of intellect.

Conceiving the world thus, man inevitably feels like a fragile toy at the mercy of indifferent forces; accordingly, while not disregarding the fullness of youth and beauty, he takes a cruel pleasure in emphasizing the miseries of human existence and its ultimate decrepitude. Beside opulent beauties whose affected coquetry is displayed in the most strangely contorted attitudes, Hindu art represents the divine mothers (a group of goddesses; PL. 229) as emaciated and wrinkled hags; nor does it shrink from scenes of the most atrocious repugnance (*bībhatsarasa*), which it represents with complacent sadism. The blasphemer, whose movements as, seized with sudden terror, he turns to flee, have been rendered with such consummate beauty by the sculptor of the Cave of the Avatars, is elsewhere represented paying the fearful penalty for his impiety: the deity, holding the wretched creature over his knee, sits calmly dismembering and disemboweling him, surrounded by the monstrous host that haunts the crematory fields: vampires and witches with drooping bosoms, bedecked with human bones, and growing intoxicated on marrow, which

they drink out of human skulls. Hinduism's sense of the fragility of humankind also promoted, particularly during the medieval period, the taste for a grandiosity that overwhelms and dumfounds: the relief carvings illustrating the puranic myths, such as the Dream of Viṣṇu and the Descent of the Ganges, or "Arjuna's Penance," at Mamallapuram (PL. 231), the Boar Avatar at Udayagiri, and the Churning of the Sea of Milk at Angkor Wat, eloquently render a titanic spirit. The architectural gigantism, which would have reached a climax in the unfinished Temple of the Sun at Konarak (PL. 486), stemmed from the same tendency. While Buddhism takes man as its starting point, assigning him a privileged and unique place in the moral system of the world, Hinduism, whose gods represent cosmic as well as spiritual forces, relegates man to a microscopic place in the universe.

Epochs in which there is an acute awareness of the precariousness of man's status (e.g., the declining Middle Ages in Europe), seem to like to confront the forces of destruction (represented by the ravages of time) with the forces of life bent on wresting from the agents of death an equilibrium that is apparently imperiled, strife-ridden, and at the point of extinction. And what contest could more forcefully render this vital frenzy than that of love? However, since love (*śṛṅgārarasa*) necessarily engages two people at once, it inevitably poses the problem of the relation berween unity and multiplicity, a problem with which medieval Hinduism was obsessed. The clusters of couples eager to exhaust the resources of sensual pleasure which cover the walls of certain medieval temples (for instance, at Khajuraho) adumbrate a complex symbolism which makes them extremely hard to interpret.

The comparison already appears in the Upanishads: "as a man in the embrace of his loving wife knows nothing that is without, nothing that is within, so man in union with the Self knows nothing that is without, nothing that is within" (*Bṛhadāraṇyaka Upaniṣad*, IV, iii). These texts thus associated love (*priya*) with its most natural expression, carnal union. In medieval India carnal intimacy, while retaining its purely physical significance, still continued to be regarded as the most appropriate symbol of love. In effect, no moral dualism intervened to arouse the slightest distrust with regard to things of the flesh. Even the Buddhists did not unanimously condemn such things, and a few masters went so far as to maintain that the enjoyment of certain specified women was not forbidden to monks. If the brahmachari (ascetic) practices continence, he does so essentially to avoid a loss of ascetic energy (tapas); the tantric rites, however, were aimed at modifying the natural workings of physical functions, with a view to achieving a mystic and spiritual efficacy: although continence is doubtless preferable to sensual license, it is less worthy than the mastery for which it prepares; for this reason the initiate derives an increase of virility from practices that would merely exhaust the energy and ability of the uninitiated. Moreover it is in order to prove that he has transcended the natural and moral order that the Tantrist chooses forbidden women for the accomplishment of his rites.
